"I certainly think we have to thank the underground railway in Queen Victoria Street. You see, given a fall in the lay of the strata, you only have to make an outlet at one point for the drainage to be operative over an extensive area of higher ground. Of course, the point is a disputed one. The theory on which big engineers rely is that all the openings they make are securely plugged, and they will tell you that they are careful to avoid the danger of subsidence by replacing in the strata a bulk equal to that which their excavations have displaced. But that seems to me to be theory, and nothing more. How can you be sure of restoring the displaced bulk, when you are dealing with water drained off from a considerable distance? In my opinion an underground water-course is very likely sooner or later to follow the line of all these tube railways that are being constructed in London."

"Have the Cathedral authorities previously had occasion to resist projects involving excavations in the neighbourhood?"

"Yes, thirty or forty years ago the City people wanted to run a double sewer under the road on the south side of the Cathedral. That scheme was successfully resisted, the sewer being taken elsewhere. A case of the kind also occurred with regard to the Central London Railway. The safety of this structure was threatened by the position proposed for the Post

Office station. There, again, our opposition was successful, the proposed site of the station being abandoned in favour of the present site."

"And you are taking all possible steps in the present case?"

"Yes, we shall be represented by influential engineers. It certainly seems a shame that the Cathedral authorities should be put to heavy expense in order to defend a national interest. But this railway project is causing them much anxiety, and they will do all in their power to avert the danger. The position is this—the Cathedral is weak, and there are no means of strengthening it; but it will be all right if only the surrounding ground is not tampered with."

BIRMINGHAM'S ELECTRIC LIGHT.

At a recent meeting of the Birmingham City Council Mr. Johnstone brought up the report of the electric supply committee, and moved:—"That the finance committee be instructed to borrow the sum of 128,890*l.* for the erection of a generating station on the site acquired for that purpose in Summer Lane, and the sum of 75,000*l.* for the laying of new mains with subsidiary stations in outlying districts; and that subject to such loans being sanctioned the electric supply committee be authorised to carry out the said works." The General Hospital site, Mr. Johnstone reminded the Council, was purchased in July 1900, with the sanction of the Council, as a station for tramway purposes and for general extension of the mains for lighting. The question of the extension of the mains had been on the agenda of the electric supply committee since February 1900, and provision would now have to be made for the energy to be supplied to these mains, while the tramway department would want electric power before the end of 1903. It was most important, therefore, that the station should be commenced as soon as possible, and experience had shown that it was necessary to order engines and dynamos at least eighteen months or two years before they were wanted. There was no doubt that within the next few years the committee would have to ask the sanction of the Council to the full total of 239,200*l.*, and the committee had fully reported what it proposed to do, but for the present purpose the sum asked for was 128,890*l.* in addition to 75,000*l.* for new mains and subsidiary stations. The spending of the money would be spread over the next three

ears, but the building should be commenced as soon as possible. With reference to the question of the architect, it was necessary to have plans prepared under the instructions of the engineer, and as Mr. Harper had had a large experience of electric-lighting stations under the old committee, the engineer was requested to confer with him. The foundations and tunnelling, for instance, were very important, and required special knowledge and experience. It should be remembered that the electric-lighting department was a profit-earning department, and the output was increasing steadily every month. Provision must be made for still greater progress in the future, and there was every reason to hope that in course of time much help would be given to the rates from the profits of this department.

The report having been seconded, Mr. Lancaster moved, as an amendment, that the report be referred back to the committee, with instructions to consider the advisability of providing an installation station only, and to report to the Council their recommendation. He said the report was exceedingly laudable, because it did not say how many subsidiary stations were to be built, nor did it give any definite information as to what would be done with the 75,000*l.* While not opposing the work of the committee, he strongly objected to the generation of tramway currents in Summer Lane, because of the distance they would have to travel and the consequent loss of high voltage. In every one of the large electric tramway systems in this country and on the Continent the generating station was in the middle of the tram system, and the same should be the case in Birmingham. He objected to the site in Summer Lane because there was no large railway near it. There was a canal, but in times of frost there might be difficulty in getting coal, and it would be a serious obstacle to the generation of electric light and tram currents if they had to rely only on the canal service for the supply of coal. As there were to be fifty-two miles of tramways, there should be more than one generating station. It would be unwise to put all their apparatus in one station, because if a fire broke out the place might be burnt down, and the whole of the tram service would be thrown out of gear.

Mr. Balden seconded the amendment.

Alderman Clayton pointed out that the generating station would be pretty well in the centre when the city owned all the tramways.

Mr. Lancaster said he advocated a station in the centre of the tram system.

Alderman Clayton was pleased to hear a declaration from the chairman that sooner or later the committee would be able to hand over money in aid of the rates. That would be a great satisfaction to the ratepayers. He suggested, too, that it would be a saving of time in the long run if the committee applied for power to borrow the money by a Bill in Parliament.

Mr. Walthall urged that the subject should be postponed until October, when a complete detailed report might be presented. It would be necessary to supply the Local Government Board with full details, and those details might be given to the Council. At present he had not much confidence in the committee, because he remembered that in May last the Council were told the committee were going to spend in relaying new mains 6,200*l.*, whereas they spent 9,349*l.* If that was a sample of the way in which the committee's estimates were going to be exceeded the Council could not place much reliance on the figures before them.

Mr. Nettlefold moved, as an amendment, that the finance committee be instructed to borrow 108,890*l.* instead of the 128,890*l.* He said he had had fifteen years' experience in the building of large works, and it seemed to him the item allowed for building was very excessive. He had been told the figures were only rough estimates, and that the committee would not spend more money than they could help, but it was rather unfair to ask the Council to give them so much more money than they ought to require.

Mr. Nettlefold's amendment was not seconded.

Alderman Beale, in reply to Alderman Clayton, said that the original intention of the committee was to proceed by Bill, but it was, as Alderman Clayton suggested, a question of time. Two years and five months would be barely sufficient time for the work, but if they had gone for a Bill the time would have been a year less. As to a possible objection by the Local Government Board to granting the loan for power for tramway purposes before the tramway powers had been obtained, it should be remembered that even if the Corporation Bill failed someone would have to work the tramways, and, as the Council was not likely to sanction any other power than electricity, the Council would have to be in a position to supply electricity. The town clerk advised them that that was a good contention with which to go before the Local Government Board. The purchase of the old General Hospital was unanimously approved by the Council. If Mr. Lancaster objected to the situation he should have done so then; but perhaps Mr.

Lancaster had been abroad since then and had seen something else. They always looked upon Mr. Lancaster as the Solomon Gills of the Council, for, as Captain Cuttle was always saying, he was "chock-full of science." He did not think Mr. Lancaster would suggest that they should have one station at the Plough and Harrow, another in the middle of the Harborne line, and so on. The committee looked forward to the time when the whole tram system would be in their hands, and believed that it would be an advantage and an economy to have a large central power station under the control of the best engineers. There might be a better or more central site for this than that of the General Hospital, but the committee had not been able to find it. He was very sorry that the matter had had to be rushed on the Council, but it had been rushed on the committee. They wanted to be in a position to equip the Aston line at the end of 1903, and they hoped that the Harborne line would be ready also by that time. If they had any delay in obtaining the loans this preparation could not be made in the time, as there would be a danger of their having to arrange with the tramway companies for a continuance of steam. With regard to the new mains, they did not propose to proceed with them all at once, but they were obliged to have a scheme of mains to be supplied in order that the Local Government Board might be in a position to sanction the provision of the generating plant. In reply to Mr. Nettlefold, Alderman Beale suggested that it would be better to have an excessive estimate on which a saving might be effected than to have an insufficient one and have to come to the Council to sanction amounts spent in excess. Generally they were asking for sanction to a much bigger thing than could be carried out immediately. It was for the Council to decide whether it would run the risk of delaying the introduction of electrical traction, and of seizing such opportunities which might occur of getting rid of steam.

Mr. Waters hoped that if the committee were given general powers, it would be with the understanding that the general parts of the scheme would be submitted to the Council afterwards.

Alderman Dr. Barratt was satisfied with the statement of Alderman Beale.

Mr. Reynolds thought there was something in the point of safety raised by Mr. Lancaster.

Mr. Murray would have liked to see added to the resolution the words "subject to them reporting from time to time to the Council."

Mr. Johnstone, in his reply, endorsed the general explanation of Alderman Beale. With regard to safety, the voltage 550 was exactly the same as was adopted in Bristol, Brussels, Glasgow and Birkenhead, and was known to the Board of Trade as "low tension." There was no danger. Probably accidents at Glasgow were due to bad work. Mr. Johnstone pointed out that the matters for which the money was required were fully set forth by the committee, but assured the Council that each part of the work would be reported upon as it came up to be done.

Councillor Lancaster's amendment having been defeated, the Council voted on the resolution, which was carried by thirty-six votes to eleven, Mr. Adie being neutral.

The Council also sanctioned, after a short explanation from Mr. Johnstone and Alderman Beale, an instruction to the finance committee to borrow 65,084*l.*, the amount expended on the electric supply undertaking in excess of the authorized capital. This included 23,000*l.* for the purchase of the General Hospital, 20,000*l.* for plant and machinery in West Street, and 15,000*l.* for engines, boilers and dynamos, which had been ordered to meet present demands.

FRENCH PRACTICE IN THE MANUFACTURE OF CAST-IRON PIPES.*

THIS industry has developed by leaps and bounds during last few years, and much of its success is no doubt due to very practical and workmanlike methods adopted by French engineers and ironfounders.

France is now a competitor in both our foreign and home markets, and having the advantage of such shipping ports as Antwerp, Hamburg, Le Havre, &c., where the lowest freight rates are obtainable, is securing a share of a department of trade which was originally entirely in our own hands.

The *Engineer* of February 23, 1901, contains a paragraph on this subject, of which the following is a summary, viz.: "In 1685 the first service of cast-iron pipes was laid at Versailles, France, and it was not until 1746, sixty-one years afterwards, that London had its first service of cast-iron pipe; later Glasgow received its service of water through an iron pipe."

* A paper read by Mr. A. G. Cloake at the meeting of the Association of Waterworks Engineers.

tain. The French engineers confined themselves to pipes with flanged joints, the same as are used at the present time, and it was not until 1800 that the practice of socket and spigot joints, with a groove for lead, was recognised as efficient."

Unlike the American pipefounders, the French founder is an ironmaster, and is fully alive to the advantage of obtaining complete analytical knowledge of the iron used. Naturally his study has its reward, and by close application to experiments and the mixing of the different grades of pig-iron, a result is obtained which secures castings of the first quality, being dense, tough and of a close-grained nature. In order to secure uniformity in mixing the various grades of iron, French manufacturers are particularly careful in seeing that the right quantities of each grade of pig-iron are placed in the trolley before entering the cupola; an examination is then made by a chemist, who signs for the accuracy of the mixture and allows the trolley to pass to the cupola.

Casting pipes vertically is the only method accepted by the French engineers, even in the case of such small diameters as 10 mm., 50 mm. and 76 mm. (respectively 1½ inch, 2 inches and 3 inches), a practice which is not, the author believes, followed in any other country. It is, of course, needless to point out to the members of this Association the superiority of vertically cast pipes over those cast on the slope, not only as regards strength, but also in respect of deterioration.

The pits for these pipes are built both circular and rectangular, and measure respectively from 30 feet to 40 feet in diameter and 35 feet by 20 feet, with a depth of 16 feet. This is necessary because of the standard lengths of pipes, from 9 inches diameter and upwards, which are usually made in lengths of 4 metres (13 feet 2 inches), socket to socket.

The cores are made in one piece of hay or straw bands wound on a steel tube, afterwards worked up with sand, by machinery, which considerably expedites the manufacture and ensures accuracy. The core ovens are adjacent to the pits.

The system of straining the molten metal adopted by the Société Métallurgique d'Aubry et Villers is that devised by the managing director, M. Jacquemart. This permits the socket being cast upwards, with a feeding head from 12 inches to 12 inches above the socket, according to the size. The pipe is connected to the pipe mould by an annular aperture 1 mm. wide (for an 8-inch pipe), through which it is impossible for any dross or sillage to pass, such impurities being at the top of the feeding head, 8 inches or 10 inches above the socket, and when the pipe is cold they can be struck

off with a hammer. Under this system the spigot ends are rendered very dense, owing to their solidifying under pressure, and truly cylindrical and concentric castings are also obtained.

The usual English practice in filling the moulds is to pour the metal direct from the ladle through gates or holes made in the mould, which are liable to get extended, and thus allow dross to pass, and the socket, if at the bottom, gets the first rush of the impurities. It is true that the metal is usually skimmed at the top, but this by no means prevents sillage and dross getting down into the casting, and a straining process is therefore indispensable to secure a clean and true casting.

The pattern of socket mostly adopted by engineers on the Continent and abroad is similar to that used by the Post Office authorities in London for cable pipes, and admits of a straight pipe being set at an angle of 1 in 24 without allowing the pressure of water to come in contact with the caulking material, as the spigot, even at this angle, sits tightly on the seating of socket. As it is seldom that a line of pipes is laid perfectly straight, and difficulties invariably arise in making the joints at all angles and curves, the advantage of employing the socket and spigot above referred to will be readily appreciated. The greater lengths of pipes used on the Continent also effects a saving in the jointing, owing to the reduction in the number of joints. The risk of leakage is also reduced for the same reason.

Providence seems to have specially favoured France in providing her with the finest sand for foundry purposes, large quantities of which are imported into Great Britain. The fine skin seen on French pipes is attributable not only to the careful mixing of the pig-iron, but also to the quality of sand in which they are cast.

The standard lengths of cast-iron pipes in use on the Continent are, as has already been stated, longer than those adopted in this country. The following table gives a comparison between the French and English standards:—

French Pipes.		British Pipes.	
1½ in. and 2 in. to lay	2 metres 50 (8 ft. 2 in.)	2 in.	to lay 6 ft. 0 in.
2½ in. to 8 in.	3 " (9 ft. 10½ in.)	2½ in. to 15 in.	" 9 ft. 0 in.
9 in. and upwards	4 " (13 ft. 2 in.)	12 in. and upwards	" 12 ft. 0 in.

The saving in the cost of laying secured by the longer lengths totals up very considerably, when the reductions in jointing material, weight of sockets, weight of lead and yarn, and in men's time are taken into consideration.

The weights of French pipes are about the same as English

vertically cast, but owing to the quality of metal used the French founders claim to be able to work a lighter specification under similar conditions as regards pressure.

The specification adopted by the General Post Office, London, for cable pipes is largely used by French pipe-founders in supplying other European towns, South America, Japan and the East. It is also to be observed that the smaller diameters of pipes are not usually made in this country, and therefore such orders must be given to continental firms.

The coating for pipes generally used in France is Dr. Angus Smith's process, the pipe being reheated and lowered into a hot bath of the solution, as in this country. The ordinary test is generally 20 atmospheres, although this is sometimes increased to 800 feet head of water in special cases.

Ever since discoveries in metallurgy permitted of the manufacture of cast-iron pipes this metal has been used for the distribution of water under pressure to the exclusion of nearly every other, and owing to the convenience and cheapness of casting pipes to any required shape and length and the natural resistance of cast-iron to oxidation, its supremacy for the purpose is practically undisputed. At the same time, the development of public water service and the increases of volumes and pressures have created new conditions which have revealed certain deficiencies in cast-iron as a material for the manufacture of water mains. For small-diameter pipes cast-iron answers perfectly well, and is adaptable to all contingencies; but as the diameter and pressure are increased difficulties arise in connection with the transporting of such heavy pipes, and there is a natural disposition to reduce the thickness as much as possible, with a consequent sacrifice of security. This is the more serious in view of the fact that with pipes of large diameters a shock, which may be quite immaterial in the case of small-diameter pipes, attains with a larger volume of water a tremendous intensity, and cast-iron, although well adapted to resist regular and progressive pressure, is totally incapable of resisting even comparatively slight pressures if they occur in the form of sudden and instantaneous shocks.

It is to remedy these difficulties, and to give to cast-iron pipes a greater resistance against such shocks, that M. Jacquemart has introduced the system of winding steel wire, under pressure, round the extremities of the pipes, and in grooves cast in the body of the pipes.

The idea of shrinking steel bands on to cast-iron cylinders is very ancient, and at the present day English pipefounders

shrink wrought-iron bands on the sockets of large diameter pipes intended for export, to prevent breakage in transhipment; but there is no doubt that steel or wrought-iron bands shrunk on in this manner cannot bear with perfect uniformity every particle of the surface, as owing to inequality in shrinking some parts must be more strongly compressed than others.

The problem was, therefore, to find some method which would cause the bands to follow exactly the shape of the pipe to be enveloped, and exert an even pressure throughout. This is satisfactorily accomplished by the method of winding about referred to. It is clear that in the manufacture of pipes the idea of using complicated machinery must be rejected, and was therefore essential to provide a method of winding which while being perfectly simple in its application, would secure perfect uniformity of tension in each wire wound round. To solve this problem M. Jacquemart started from the fact that steel wire of uniform diameter must have a constant resistance throughout its length. He therefore devised a method by which the wire is passed through a draw-plate, which reduces it to a certain fixed diameter. A means of winding at an even and constant pressure is also a very important feature of the process. The winding is effected by revolving the pipes, the wire first passing through the drawplate above described and the desired amount of tension. Another important point in the application of steel wire is the bedding of the ends. This is effected by shaping the edges of the grooves, so that the extremities of the wire can be bedded into them, and thus be securely fixed, and for greater security liquid tin is poured over every wire, which perfects the arrangement. It is also essential that the steel bindings should be of the same durability as that of the cast-iron; and to secure this asphalt is put on at high temperatures, which penetrates the spaces between the coils and completely covers them. This is kept in place by the edges of the grooves, so that the whole forms a block of great strength, perfectly impermeable, and absolutely proof against oxidation.

The results of experiments with these steel-bound pipes show that it is possible to avoid a burst with a large main, and the behaviour of the pipe under such conditions as sudden and instantaneous shocks, shows that pipes of this type are absolutely proof against fracture, and even when strained to the point of fracture, the damaged parts remain in their original position.

A cast-iron main of this type, 2 metres (78 inches) diameter, has been laid by the water company of Paris.

The Architect.

THE WEEK.

It is commonly assumed that by-laws relating to buildings are applicable only to those which are erected after the orders are issued. The new by-laws as to drainage and sanitary fittings of the London County Council will be no less operative whenever alterations or repairs are required in connection with the drainage system of existing houses. By-law 21 is as follows:—"These by-laws shall, so far as applicable, apply to any person who shall construct or reconstruct any pipe or drain, or other means of communicating with sewers, or any trap or apparatus connected therewith, so far as he shall effect any such works in any building erected before the confirmation of these by-laws, as if the same were being constructed in a building newly erected." Sanitary authorities have occasionally acted in the spirit of the by-law in endeavouring to insure more safety in the drainage of old houses, although the legality of their proceedings might sometimes be questionable. Henceforth it will not be possible to introduce a new sink in the kitchen of any house now existing in the metropolitan area without complying with the stringent rules and regulations of the Council. Owners and occupiers, as well as plumbers, will have to remember the changes in the sanitary requirements of buildings in London.

THE members of the Rhondda Naturalists' Society have undertaken excavations in the enclosures on Mynydd y Maendy, under the direction of Mr. H. W. WILLIAMS, F.G.S. The place was evidently a prehistoric fort, but the walls were long ago destroyed. They were about 9 feet in thickness, and in the selection of the site natural advantages were turned to account. Self-preservation sharpened the wits of the early VAUBANS and COHORNS. The fort or camp must have been found exceedingly difficult to approach. Flint implements and a metal spear-head have been met with, as well as several cooking stones. Some other stones and objects remain as subjects for investigation. There is no evidence to show that circular huts existed at Rhondda, as in other places, and therefore it is impossible to say with certainty what kind of habitations were used; but floors which have been discovered, as well as the pieces of charcoal and fragments of pottery, are enough indications without the flint objects to show that the place was a safe abode.

THE production of paints is one of the few English industries about which we rarely hear complaints of decline through foreign competition. This is the more remarkable, since for the majority of the materials out of which paints are made we have to depend on imports. The part played by machinery in the manufacture is so important, it might be easy for foreigners to obtain English grinders, pulverisers, rollers, &c., and in that way attempt to become our rivals. But the efforts which have hitherto upheld the industry in this country are not likely to be slackened, and we can believe that our manufacturers will be able to meet any new demands that are made upon them. In no business is honesty more essential, for paints which are made up of pure materials are always sure to wear well and give satisfaction to all who pay for them. The subject of the manufacture is represented by few English books, and indeed it would seem to be assumed that foreigners are the best guides to the operations, which is, of course, a great fallacy. The new book on "The Manufacture of Paint," by Mr. J. CRUICKSHANK SMITH, B.Sc., which Messrs. SCOTT, GREENWOOD & Co. have added to their industrial series, therefore fills a void in technical literature. Descriptions of the machinery employed occupy many of the pages, for when the character of those auxiliaries are understood the processes in which they take part can be easily explained. Much ingenuity has been shown in superseding the work of the old colour grinders, which was laborious as well as unhealthy, and a paint manufactory is now a remarkable example of mechanics and organisation. Much more could be accomplished if the aid of the architect in designing the building was more often utilised. Mr. SMITH's book is practical throughout, and it will be found helpful to those engaged in the industry and those who make use of paints.

ONE of the buildings visited during the excursion of the Suffolk Archæological Society was the old church of All Saints, Icklingham. It is no longer used for services as another church exists in the parish. The exterior presents a contrast to the interior, which has more than the usual coldness of a building that has been long unused and neglected. The present structure was evidently erected on the site of a Norman church, and with the exception of the Perpendicular porch, belongs to the Decorated period. In the fourteenth century Icklingham appears to have been in a prosperous state, for the work is rich and therefore costly, the south aisle especially so, as shown by the two beautiful niches at the east end on either side of where the altar stood, and also by the beautiful stone carved cornices which run the whole length under the eaves of the south wall and below the wall-plates of both the north and south walls on the inside. The windows are very fine, but unfortunately the east one has the whole of its head filled in solid. The stained glass which remains is also very good. It is worth noting that the fine western tower never had a staircase. All the original roofs have gone. The method of plaiting the reeds on the underside of the thatching, so as to avoid the use of wood battens, is interesting. The tile paving, a large quantity of which remains in the chancel, and fragments in other parts of the church, is of an unusual description. There are six or eight different patterns formed by the shapes of these tiles, and many have ornamental patterns on them. The chancel screen, which is Perpendicular in style, has had its upper portion cut away. It is somewhat unusual in having a very large oak sill, which measures about 11 inches square, and this taken right across the passage-way and provided with a step to it, the pavement of the chancel being level with that of the nave. There are a large number of fourteenth-century oak benches remaining. The ends have fine carved poppy-heads, and some of them are remarkable on account of their being very little over an inch thick. It is remarkable that so interesting a building should be allowed to remain in a condition which is a satire on the esteem for antiquity which is reputed to prevail in this country. As a church All Saints may have ceased to be useful, but Parliament should make provision for bringing it and similar buildings under a protecting power like that which exists in Ireland for the protection of Christian as well as Pagan structures.

THE Ecole des Beaux-Arts possesses an immense number of paintings which gained for their authors the Prix de Rome. Some are the worse for the effects of time, but even among those works several can be selected which have interest on account of the success afterwards attained by the students who painted them. It is now proposed to exhibit as many of the pictures as can be accommodated in one of the galleries of the school. The examples will not be confined to those of deceased artists, for the prize works of several painters who are still living will be brought to light, and will no doubt form the most attractive part of the exhibition. It does not always follow that a young painter who gains the Prix de Rome afterwards has the success that warrants his election to the Institut. But many of the prizemen have justified the anticipations of their friends and confirmed the judgment of those by whom the prizes were awarded.

LONDON is generally considered to be the healthiest of the great cities, and it is remarkable that the eminence was attained without the aid of any efficient or uniform sanitary code. The new drainage by-laws of the County Council which came into operation two months ago are likely to insure a still better condition, and we may expect to find the death rate in the Metropolis is the minimum in Great Britain. The edition of the by-laws, with annotations by Mr. G. J. G. JANSEN, C.E., published by the Sanitary Publishing Company, Ltd., will be found a convenient guide to all who are concerned with new or old buildings within the metropolitan area. The by-laws are clearly expressed, but their meaning is emphasised by the notes appended to almost every one of them. A comparison is also made with the practice in other places, and the diagrams are sufficiently numerous.

THE FLOWING LINE.

(BY A CORRESPONDENT.)

THE phrase "flowing line" does not necessarily express a varying curve, for water can flow more easily in a canal or conduit with straight sides than in a river in which there are changes in the course. But it serves as well as "flamboyant," for only a limited combination of curves can resemble a flame. The word "flowing" is, however, sufficiently clear to most Englishmen when applied to lines, and especially to those formed by designers. The two words have now their use, for what has been condemned as the "New Style," or the "New Art," in furniture, and to some extent in architecture and architectural decoration, is to some extent the employment of the flowing line. The subject is, however, no new one, for it is almost as old as architecture and decoration.

Speaking generally all straight lines may be considered as in opposition to nature. When we say a river follows its own sweet will, we mean to say it has formed a special channel, which is very rarely a straight one. The contour of a watershed which supplies a river is also a curve or a series of curves; while hills and mountains, which are desirable aids, although not always obtainable, cannot be described as planes even when they are made of the hardest materials. Landscapes usually consist of a vast number of curves, and artists in their representations of a country scene have been often compelled to introduce buildings merely for the sake of contrast. The stiff vertical lines bring out the difference between man's work and nature's operations more plainly than is possible by any other arrangement. The straight trunks of pine trees in some cases are more expressive, but they cannot be employed as commonly as buildings, and are less emphatic.

Now it must be admitted that although man is surrounded by curves ranging from a leaf to the horizon, yet he has preferred straight lines in his buildings rather than curved. Undoubtedly we can still see in the huts of savages, who are ignorant of framing, a tendency to use the curve, and authorities like the late WILLIAM SIMPSON found so many examples of domes in remote parts of Asia, they were justified in concluding that domical coverings may have been older than triangular roofs. In the early days, however, of what may be regarded as civilisation, there is enough evidence that planes and straight lines were most sought after in building.

The curve was, however, an element in primitive decoration. Geometry, in the mathematician's sense of the word, probably is not very ancient. It has been said in doggerel verse:—

To teach weak mortals properly to scan,
Down came geometry and formed a plan.

But long before plans of land were made by the Egyptians, or plans of houses by the Eastern monarchs whose portrait-statues, bearing slabs with plans, are to be seen in the Louvre, there was a geometry known which was of service in ornament. It was simple enough. Circles, semicircles, crescents, frets, zigzags and the like, all of regular construction, are familiar to students of prehistoric archaeology. They were employed by men who could hardly have been versed in mathematics. The "practical geometry" of the present time is only a continuation and an extension of the old empiric system, for probably not one in ten of the men who can work out several problems by the aid of a ruler and compass would be able to demonstrate the absolute accuracy of their operations by Euclidian principles.

Once geometry, or, rather, the art of drawing exact figures which were parts of circles, became known it obtained a firm footing in the arts. In all styles of ornament it is possible to trace the influence of rigid rules, empiric or otherwise, in rigid geometrical forms. Nor is that influence at an end. Not many years have elapsed since the Government of this country disseminated through its drawing-masters the absurd principle that no forms could be ornamental unless they were based on that practical geometry which was taught in the schools, or, in other words, the use of curved figures was restricted to those which could be struck out by an ordinary compass. With the meekness that is characteristic of Englishmen when they have to obey the edicts of established authority, geometric

ornament was applied to everything. Unfortunately, in foreign markets the forms decreed by the English governmental system were not admired, and in consequence English manufactures suffered a grievous loss. It is needless to say, however, that an official department can always find people to believe in its infallibility, and the condemnation of what is called the "New Style" has partly arisen out of the dissatisfaction of those who have some reason in upholding the moribund system over which so much of the public money is still wasted.

It is not difficult to demonstrate that from an early time the world has been wearied of mechanical repetitions of the circle, whether alone or in combination with right lines. Anyone who will look at PENNETHORNE'S book, in which Greek mouldings are analysed with marvellous industry, will discover that such geometrical forms as could be produced by the aid of a compass had become obsolete not only for the curved lines in temples, but for the contours of vases. More subtle forms were demanded. Hence, as we know, vertical and horizontal lines became curves in the hands of artists who, no doubt, were condemned by the old school for their dangerous and illogical defiance of established truths. Several varieties of ornament, made up of a combination of curves, were taken by Greeks from Egypt and Assyria. The employment of caryatides was also the expression of a desire to obtain more variety in lines than even the new geometry could supply. Greek Doric was admirable, especially as we see it modified in the Parthenon. But its upward lines were insufficient to satisfy the craving for animation in all things which may be reckoned as an instinct in man.

The caryatides were no more than a new application of figures corresponding with those seen in Egyptian buildings and in others of Assyria. The colossal forms at Ipsamboul are buttresses rather than columns, still they have their constructive use. In other buildings statues of gods and kings are made to strengthen piers. The painted decoration is perhaps more worthy of note, as a desire to have varied lines of ornament running from the ground to the summit of the temple. The ponderous columns, instead of appearing as a burden on the earth, gained a degree of lightness in appearance by the soaring lines of the human figure and other ornament. The Egyptians were not satisfied with representing the lotus bud or flower in bands. In some spaces and panels they were not afraid to introduce the long stalk of the plant, generally in vertical lines, and what we see in the "New Style" has therefore relationship with the works of the ancient Egyptian artists. Hieroglyphics were not arranged like modern printers' type in order to be read from left to right or from right to left, as in old writings, but in vertical lines. The different symbols therefore form inscriptions of remarkable variety in appearance, and they are sometimes contrasted with straight lines which were used to divide the various sentences or divisions. The painting in the British Museum showing a man working in the fields suggests the love of verticality which prevailed in Egypt. The stems of the wheat become emphatic in the lower part of the painting where they form a contrast with the lines of the figure, while above we see various divisions of hieroglyphics. If the eye follows a line, partly imaginary, in an upward direction along the figures and hieroglyphs of an Egyptian decoration, a series of curves will be obtained which are as manifold as any in the new decoration.

Egyptian temples were so massive, it was not remarkable there was an effort to suggest height by the soaring lines of men, birds, &c., but Greek temples were kept low, although they might be placed on the summit of many high steps. The Parthenon, for instance, was not so high as the helmet of the great statue of ATHENÉ. Horizontality might be considered the characteristic of Doric. From the temples the quality passed to the vases, or *vice versa*, and hence it is not unusual to see the work of Greek potters decorated by a series of horizontal bands. Ascending lines had therefore to be used in moderation, but most of the ornamental forms suggest by the combination of curves the principle which inspires the latest style of decoration.

We cannot be expected to trace the history of the flowing line through all the divisions of early art. The ornamental structure known as the tree-symbol, which is so often seen in Assyrian decoration, reveals a desire for

elevation and variety which is remarkable. It may have had a mystic meaning, but it must have been inspired by an effort to show vitality in curves by means of changes in their direction. Yet it is a striking fact that in the latest Eastern ornament, that known as Moorish, we have a more elaborate combination of curves, and which, moreover, is enough to indicate the tendency to a climax which is commonly found in the form of a dome. There is so much apparent complexity in the curved lines that even artists were surprised when it was ascertained that repetitions were a characteristic of Moorish art. Deprived of the power to use the beautiful lines of living forms, the Moors were compelled to fall back on a geometry which is very different from what was known as "practical" in this country. In this case also, if outlines are followed from below upwards, it will be realised that some great curved lines must have been used as a basis as well as the more simple lines which OWEN JONES discovered. In spite of the countless recurrences, there is a general effect which could not have been attained by piecemeal designing alone.

The treatment of curved lines in Mediæval architecture would need a volume for its consideration, and that a large one. Geometric curves, which could be struck out by a mason, were undoubtedly employed for many centuries, and the ornamenting of arches and capitals displays innumerable repetitions of simple forms. We have only to look at a small church like Iffley or Climping and compare it with the latest developments of the style in order to conclude that in the early Mediæval period the forming of curves was only a sad mechanic exercise, while in some of the Spanish churches curvature was carried to excess, as if in rivalry with the Moors. In England men were sober, and apparently never cared to exercise the skill which is to be found in so many examples of the French Flamboyant and the no less remarkable German Gothic. But we can see now that the effort to produce curves which could not be authorised by precedent was in keeping with the speculations in many fields of thought. The experiments of the architects produced material results, whilst thinkers were unable to do more than record their conclusions in books and leave the realisation of them to future generations. If it is better to have fifty years of Europe than a cycle of Cathay it is surely more encouraging to see such hazardous examples of stone-cutting as meet the eye in later French Gothic churches than in the spiritless Norman churches of this country or in some of the later Gothic buildings where variety seems to have been excluded under a penalty.

The outcry against the "New Style," of which a few examples in furniture are to be seen in South Kensington, arises partly from a weakness for straight lines. It is supposed that the use of the curve in moderation may be advantageous, but the extent of its employment is assumed to have been long ago determined. Every departure from established usage is now taken as a heresy. The curve was to be in every example of ornamental art only subservient to the straight line. When, therefore, we see that in furniture curves predominate, it is assumed by those who are wedded to old notions that sans-culottism in art has broken out. There is no reason why curves should not be used instead of straight lines where the change causes no inconvenience. If the parts of a piece of furniture which have to support objects are curved they may not answer their purpose as well as a plane surface, but when curves are used to frame spaces there is no impropriety in the innovation. We have grown so accustomed to the straight line, it is easily understood why eyes should be surprised when they see a change and should not at first be able to recognise its advantage. Heretofore curves were used mainly in mouldings; they were therefore not obtrusive. Now, when they appear to force themselves on the sight they are treated like presumptuous people who do not know their own place in the economy of society. The curve has not been allowed to display itself as it merits, and we need not be astonished if some designers signalise the beginning of an epoch of liberty by occasional extravagances, for that is the usual course in revolutions. But, as we have seen, there has been an aim in all ages to employ curves liberally, although rarely successful, and what is now attempted is only a repetition of the effort under more favourable conditions. The manipulation of materials can

be carried out to an extent that was impossible in a former time. A gate like that designed by Mr. E. WOOD and wrought by Mr. G. WRAGGE, which was seen in an advertisement last week, could not have been produced a very few years ago. When so much success is obtainable in metal it is to be expected that men who work in other materials will endeavour also to exhibit equal facility.

What is done, however, in those cases must be offensive to all who appear to think that natural exemplars were not fitting models for the designers to keep in mind. The use of leaves and flowers when geometrised was partially allowed, and the compromise was thought to be a very happy expedient. But in the new style suitability is found not only in flowers and plants, but in stems. The Japanese designers had demonstrated the effectiveness of projecting a long line of stem across a vase, and then devoting care to one beautiful flower which formed its coronal. In the "New Style" the idea has been realised in wood and iron. Instead, therefore, of the all-overishness which was at one time considered indispensable in decoration, we now see concentration of labour and thought only in particular parts of the design. The execution may be accomplished by the aid of machines, but at least the arrangement becomes suggestive of the spirit in which the designer worked. An excess of ornament defeats its purpose. That was the principle on which the late H. R. RICHARDSON acted when introducing carving in his buildings, and the lesson he taught is applicable to other arts than architecture, and should not be confined to Americans.

The "New Style" would not have been taken up so quickly in France and Germany if it had not qualities which were rational and attractive. In the first place, it allows every object to be treated as a whole without the number of repetitions which are usually exhibited in furniture. In the use of materials it presents the old Gothic honesty. We have seen pieces of furniture which in some respects recalled Scandinavian work, while in others they were reminiscent of Japan. As yet the "New Style" may be incomplete, but none of the revivals of the nineteenth century afforded so many promising prospects of occasions to employ the designing power and the manipulative skill of the present time.

PIONEERS IN ENGLISH ARCHÆOLOGY.

THE majority of the buildings which are visited during the excursions of the various archæological societies can be considered as examples of Gothic, and especially of Gothic churches. New interest is given to a building when a paper on its history or characteristics is read, and generally the incidents narrated are also novel to those present. In not a few cases the existence of some, at least, of the edifices is a surprise to many of the members. It would be easy for an enthusiastic archæologist to preach a sermon on the circumstance, and to point out the ingloriousness of those who are indifferent about works of architecture which have been long and closely connected with the national life. Censors ought, however, to bear in mind, as an excuse for the absence of knowledge about Mediæval buildings, that the study of them was for years interdicted by prejudice. Here and there a local antiquary might be found who was devoted to the past, and who had gathered a number of traditions about buildings in the neighbourhood which were not always trustworthy. But with ordinary people antiquity was considered to be profitless, and any curiosity that might occasionally arise about ecclesiastical buildings was, as a rule, satisfied by a visit to one or two cathedrals.

Although economy ordained that Gothic churches had to be used, it is well to remember that from the time of the Reformation to the middle of the eighteenth century there was no English writer who was sufficiently courageous to describe them as interesting examples of architecture. Much has been made out of the one or two references to Gothic cloisters and Gothic windows found in MILTON. But it could not be assumed from them that his spirit was in harmony with anything Mediæval. It must, therefore, have been astonishing to the few people into whose hands the work fell, when in 1742 BATTY LANGLEY brought out a collection of plates in support of an appeal for more

interest in Gothic buildings. LANGLEY was, however, a person of no authority with the public; and though we should be grateful to him as a pioneer it is not to be supposed he aroused much admiration for old churches. Twenty years afterwards HORACE WALPOLE endeavoured to prepare readers for "The Castle of Otranto" by writing about Gothic buildings. It was, no doubt, taken to be a degradation when a fine gentleman was found to take up so curious a subject. But it afforded him an opportunity for the exercise of his peculiar wit. He was able to declare that anyone who refrained from investigating the history of architecture in England would know as much on the subject as those who attempted inquiries. TOM HEARNE, BROWNE WILLIS and others of the latter class, "did now and then stumble upon an arch, a tower, nay, a whole church so dark, so ugly, so uncouth, that they were sure it could not have been built since any idea of grace had been transported into the island." Gothic, if it had a voice, might well cry out, "Save me from such friends as HORACE WALPOLE." The utmost praise he could say for the style was that it infused sentiments of romantic devotion, meaning superstition. He advised architects who had exhausted all their patterns "when they have built a pediment and portico, the Sibyl's circular temple, and tacked the wings to a house by a colonnade," to make some deviations into Gothic as a remedy against servile imitation. WALPOLE at the time was a friend of GRAY, the poet, who in his quiet way loved English Gothic as much as any of the styles he had seen in Italy. Owing, apparently, to GRAY's influence he was forced to admit there was some beauty to be found occasionally in Gothic, which, he said, "seems to have been at its perfection about the reign of HENRY IV., as may be seen particularly by the tombs of the archbishops at Canterbury. That cathedral I should recommend preferably to Westminster to those who would borrow ornaments in that style. The fretwork in the small oratories at Winchester and the part behind the choir at Gloucester would furnish beautiful models. The windows in several cathedrals offer graceful patterns; for airy towers of almost filigraïne we have none to be compared with those of Rheims. Some instances of particular beauty, whose constructions date at different eras from what I have mentioned, have been pointed out to me by a gentleman to whose taste I readily yield, such as the nave of the minster at York (in the great and simple style) and the choir of the same church (in the rich and the filigraïne workmanship), both of the reign of EDWARD III. The lady chapel (new Trinity Church) at Ely and the lantern tower in the same cathedral, noble works of the same time; and the chapel of Bishop WEST (also at Ely), who died in 1533, for exquisite art in the lesser style."

In most of this we see a sneer against contemporary architects, who were not noble lords, with "every quality of a genius and artist except envy." "The Castle of Otranto," when it appeared in 1765, excited romantic emotions. Gothic buildings were assumed to be the work of mysterious beings who were enslaved by crime and erected gloomy structures for their unhallowed transactions. That interest, although it was only false, was better than the indifference which heretofore had prevailed. It encouraged writers. A few years afterwards the Rev. J. BENTHAM was bold enough to publish a history of Ely Cathedral, in which he demonstrated that the building was the work of able architects and masons, and that the style deserved the consideration of men who were versed in art and science.

With the nineteenth century came a diminution of the contempt for Gothic, which was the characteristic of ANNE's Augustan Age in the preceding century. KING's "Munimenta Antiqua" was in part devoted to ecclesiastical architecture. Unfortunately the author had accepted erroneous notions about the Gothic style, and was unable to realise how much was done by the Normans as builders, and their superiority in that respect to the conquered Saxons. But in the same year another work appeared which, although less pretentious, served as a corrective to KING's fanciful conclusions. That work was DALLAWAY's "Observations on English Architecture, Military, Ecclesiastical and Civil, compared with similar Buildings on the Continent," &c. The author was unable to embellish his pages with illustrations, but he appears to have seen most of the buildings he described, and he was indefatigable in

seeking information in manuscripts and old pamphlets in order to produce a true history of the art. The names of a great many artists were brought to light by him, and indeed there is an amount of information in the work which is remarkable when we recollect the state of opinion at the time. The booksellers must have met with many people who were desirous to acquire knowledge about Mediæval buildings, and it was therefore possible to find a publisher for a treatise on Gothic. The Rev. JOHN MILNER being a Catholic priest might be regarded as too prejudiced to write a treatise on the ecclesiastical architecture of England during the Middle Ages, but his volume was issued in 1811. He was positive in his conclusions, and, like KING, he was not disposed to admit any indebtedness to foreigners. He believed the Pointed arch was an English invention, but his speculations can still be read with interest, and he deserves credit for endeavouring to fix the limits of the different variations in periods. But the work which was most serviceable to architects was published in 1812, with the title, "An Attempt to discriminate the Styles of English Architecture from the Conquest to the Reformation," by T. RICKMAN. In 1813 JOHN SIDNEY HAWKINS brought out "An History of the Origin and Establishment of Gothic Architecture," which also gave an account of CÆSAR CÆSARIANUS, the first professed commentator on VITRUVIUS.

Some of the books we have mentioned were without illustrations, which in those days were costly to produce, and when plates were given they were not numerous. With the arrival of JOHN BRITTON began a new era. He merits a place in any future history of the pursuit of knowledge under difficulties. He was the first to realise the persuasiveness of illustrations of buildings, and by his "Architectural Antiquities," "Cathedrals," and other works he made Gothic churches familiar to the eyes of English people who would not venture on explorations to see the originals. How onerous was the task attempted by him cannot now be realised. In those days it was believed that the use of cathedrals was to provide appointments for a large number of officials. BRITTON has recorded why he was unable to describe and illustrate several of the buildings. It was solely through the rapacity of the Deans and those who served under them. The fees demanded for the privilege of making drawings were more than he could afford. One of the consequences of the sordid opposition is that what might have been a great work on the cathedrals of England, and a record of their appearance before subsequent alterations had been undertaken, is deprived of parts which would be among the most interesting of all. But in spite of all obstacles, JOHN BRITTON contrived to enrich students with numerous steel engravings of Gothic buildings. Most of his plates were, however, only general views. The second PUGIN entered more into detail, and was able to trace the unity of style which was general in Mediæval times, and which was shown in the work of the goldsmith, the metal-worker, the embroiderer and other artists, as well as by the builder.

The more English Gothic was investigated the more it became apparent there must be a connection between it and continental examples. Accordingly, several antiquaries and artists travelled over Europe for the purpose of comparing foreign with English structures. COTMAN and DAWSON TURNER devoted much time to Normandy; WHEWELL studied the churches in the Rhine district; WILLIS investigated the construction of the Italian Gothic buildings; while GALLY KNIGHT followed the course of the Normans in the South of Italy as well as in Normandy. The effect of their labours was that although English Gothic was found to be no isolated product as regards design, it was proved to be related in many ways to buildings which were far apart. Having so much evidence to enable comparisons to be made, it became more easy to realise the special peculiarities of English work. Nor must we forget to mention the services which were rendered by the Society of Antiquaries. The range of its operations has been always world-wide, and during its existence there has been no special favour shown to English architecture; but in the beginning of the last century, when inquirers were feeling their way towards proving that the Gothic style did not correspond with bad Latin, and was not the production of barbarian builders, an occasional essay printed in the "Archæologia" about the skilful construction undoubtedly

helped the cause by extending knowledge among a class of men who were especially subjected to prejudices.

The task of directing investigations which the Society of Antiquaries declined was afterwards taken up by new societies which were founded for the study of English work. Co-operators were immediately forthcoming. Professor WILLIS gave the example of a man who was a master of science finding in archaeological inquiries subjects which demanded all the strength of his intellect. What was said of CUVIER and OWEN could be applied to him. As they from a single bone were able to reveal the kind of animal to which it belonged, WILLIS from a few fragments of a foundation *in situ* was able to lay down the original plan, and his idea or theory was subsequently sustained by documentary evidence. The value of his services to archaeology cannot be questioned, and it is to be regretted that steps have not been taken to make his writings known to students of a later time. WHEWELL also occasionally aided archaeology with his varied knowledge. PARKER was in the opinion of many a host in himself, for he not only was able to find a point of view of his own, and work out subjects with great perseverance and good sense, but he made it plain to all that a man of business, and, what was more extraordinary, a publisher, could take an interest in the past and hold his own against men who were entitled to be considered as specialists. He was combative, too, and enlivened many meetings in attacking and repelling attacks. In that way he also added interest to discussions. Architects like SCOTT and STREET sometimes brought their practical knowledge to the aid of amateurs, but they were too busy in their own professions to be calculated on for every meeting.

We are in England becoming more and more devoted to specialism, and this is exemplified of late in archaeological meetings. Gentlemen who have devoted themselves to a particular district have the best chance of success as guides or lecturers. Such a competitor as Mr. W. H. ST. JOHN HOPE, who has taken all England for his province, is, of course, an attraction that is always prized. But he would perhaps better serve the cause of archaeology if he allowed himself to rise to broader views, and to leave to residents of a county the task of dealing with particular cases. What is desirable is that local archaeology should be popularised, and with study and enthusiasm it is possible for a man to become an oracle in a county or a district without involving himself in any extraordinary sacrifice of time or duties. The late J. L. ANDRÉ was an example. He was an engineer, but having a residence in Horsham he began to take an interest in those remains which were easily visited. He read papers which were dictated by the good sense which is imparted by professional training. His sphere of operations gradually extended, and in all parts of Sussex there was no more welcome presence at archaeological meetings. It is not to be expected that a WILLIS, PARKER or SHARPE can always be secured, but archaeology is so vast a subject it can be treated under many aspects. The onerous work which the pioneers accomplished need not be again repeated, but enough remains to be done by an intelligent follower who can be inspired by their courage and industry.

EXAMINATIONS IN ARCHITECTURE.

THE following are the questions submitted to candidates at the recent examinations of the Royal Victorian Institute of Architects:—

History and Characteristics of the Styles of Architecture.

Examiners: Percy Oakden, A.R.I.B.A., F.R.V.I.A.; Anketell Henderson, M.C.E., F.R.V.I.A.

NOTE.—The first question, and any seven others, answered perfectly, will entitle to full marks. Candidates are not required, therefore, to attempt to answer more than eight questions, of which the first must be one.

1. Describe the three Grecian orders, and contrast with the five Roman orders. Illustrate their proportions by sketching the column and entablature of each in outline, assuming the same lower diameter to the column in each case. 2. State what you know of not more than four of the following men, giving the approximate dates of and naming some of their works:—Callimachus of Corinth, Vitruvius, Michel Angelo Buonarroti, Inigo Jones, Sir John Vanbrugh, Andrea Palladio.

3. Give the meaning of the following words and illustrate by sketches:—Eustyle, diastyle, hexastyle, hypæthral, peripteral, chevet, clerestory, pendent, hexapartite, quadripartite. 4. Describe and give sketch plans and sections of not more than three of the following, giving styles and dates:—Parthenon, Karnac, Choragic Monument of Lysicrates, Elephanta, Pantheon at Rome. 5. Describe and give an outline plan of an ancient Roman private house, naming the several portions. 6. Briefly describe the historical limits and geographical distribution in Europe of the Byzantine and of the Romanesque styles of architecture, and give some typical examples of each. 7. Briefly describe and illustrate by sketches the different styles of stone vaulting in France and England from the twelfth to the fifteenth centuries inclusive. 8. Sketch and describe the principal forms of timber roofs used in England during the Middle Ages and give some examples. 9. Briefly describe the different styles of architecture that succeeded one another in England from the death of Henry VIII. down to the end of the eighteenth century, and name a typical example of each style. 10. Describe and contrast the two following buildings:—King's College Chapel, Cambridge; the Sistine Chapel, Rome. 11. State what you know of the revival of Gothic architecture in modern times and name some of the leaders of the movement and their works.

Mouldings, Features and Ornament.

Examiners: Messrs. Butler and Hyndman.

1. Draw in section to $1\frac{1}{2}$ -inch scale a Grecian Doric entablature 7 feet high over all. 2. Draw in elevation to the same scale the column and other architectural features supporting the entablature mentioned in question No. 1. 3. Draw full size the mouldings that would be suitable for the work indicated on given sketch. Ceiling and panelling all to be in wood, finished in dull polish. Draw the joists, cornice, cap, panel mould and skirting. 4. Give sketch of the following, viz. Doric annulets, cupola, Gothic buttress slopes and weathering, also a tracery head of three-light Gothic windows, and name the period or periods to which the two Gothic features drawn belong. 5. Draw acanthus leaf carving for the face of a stone corbel or bracket such as indicated in given sketch. The drawing to be about 8 inches long and of proportionate width. Sketch a crocket, and state the period to which it belongs. 6. Give sketch of Renaissance ornament for a panel about 4 feet high by 14 inches wide to a scale of 1 inch to the foot.

Geometrical and Perspective Drawings.

Examiners: Messrs. Koch and Fitts.

1. Define the terms sector, quadrant, arc, chord, segment, tangent, area. 2. Draw the following figures:—Equilateral triangle, isosceles triangle, rectangle, rhombus, rhomboid, trapezoid, trapezium. 3. On a given line describe the following polygons:—Pentagon, heptagon, octagon. 4. Draw a circle $3\frac{1}{2}$ inches in diameter. Show method of finding centre. 5. Draw a circle touching the points of a triangle, the sides being 4, 3, 2, respectively. 6. Draw an ellipse, the major axis being 3 inches and the minor axis being 2 inches. 7. Draw a tangent to a circle at a given point. 8. Show a direct method of dividing any line into a given number of equal parts. 9. Develop a cone having a base of 1 inch diameter and a perpendicular axis of $1\frac{1}{2}$ inch. 10. A cylinder 5 inches long, and having a diameter of $1\frac{1}{2}$ inches, is to be pierced at right angles by a cone 5 inches long and $1\frac{1}{2}$ inch diameter at the base, the centres of each to intersect. 11. Draw in perspective a series of four semicircular arches each 4 feet wide, supported on 18-inch by 18-inch piers each 7 feet high. 12. Draw in perspective a four-armed cross on a base as per sketch. 13. Draw the same in isometric projection. 14. Explain the terms vanishing point, point of sight, point of distance, horizon, picture line.

Shoring.

Examiners: Messrs. Koch and D'Ebro.

1. It is proposed to build a warehouse having a frontage of 40 feet by a depth of 60 feet between two buildings, each 32 feet high and extending 60 feet back. The foundations of each are 2 feet 6 inches below the surface; the warehouse is to have a basement extending 10 feet below the surface and the full extent of building. Show by $\frac{1}{4}$ -inch scale drawing the form, number and position of shores necessary to insure the safety of the adjoining buildings; also figure the scantling of timber of shores. 2. The front of an existing three-storey building has a frontage of 22 feet, with a 5-foot doorway in the centre and a 3-foot 6-inch window on each side of same, and similar openings on the first and second floors, the thickness of wall being 18 inches. It is contemplated to form the ground floor into a shop, brickwork being carried on a girder or rolled steel joist without intermediate support. Show and describe the requisite shoring and the operation of placing girder in position so as to insure perfect safety to the upper portion of building.

*Sanitary Science.—Water and Gas Supply.**Examiners: Messrs. D'Ebro and Koch.*

1. A three-storey building has on each floor two closets, one urinal and two lavatories; they are all over each other. Show on elevation of back wall all wastes and vents, and give a short description of the work of connecting fittings with wastes and wastes with 4-inch stoneware pipes; specify sizes and material of wastes, vents, traps and flushing cisterns and all requirements of the M.B. of Works. 2. Sketch and describe ($\frac{1}{4}$ -inch scale) the most approved manner of supplying hot water to bath and lavatory on first floor from a high-pressure boiler at back of kitchen range on ground floor. Show all pipes, cisterns, &c. 3. An overflow pipe from a 400-gallon tank has to be connected with an underground drain pipe: describe and sketch how you would prevent sewer gas entering the tank (a) where the place is sewered by the M.B. of Works; (b) where it is not sewered. 4. What are the requirements of the Public Health Board relating to a public meeting-room having accommodation for 600 people on the ground floor (a) as to ventilation; (b) as to exits; (c) as to fire appliances? 5. How many lights are required to efficiently light the above-described meeting-room by gas (a) in ceiling; (b) by brackets on walls? Specify size of rising main and branch pipes to each fitting. 6. A dwelling-house is to be erected on a perfectly level site, the soil being soft; what means would you adopt to insure the house being sanitary and free from damp?

*Nature, Property and Application of Materials.**Examiners: Messrs. C. A. D'Ebro and John Little.*

1. Describe the properties a good building brick should possess. 2. Name the classes of lime you would use for (a) concrete in foundations, (b) mortar for brickwork, (c) interior plastering. 3. Describe briefly the processes employed in the manufacture of Portland cement, naming principal component parts and characteristics of good cement. 4. Describe the principal classes of building stones used in Melbourne, stating in general terms their composition, and how it is likely to affect their durability and power of resisting fire. Name typical stones in each class. 5. State the descriptions of the timbers you would use in the construction and finishing of a large public building, and give the characteristics of such timbers. 6. Describe (giving sketches where necessary) the principal systems of "fireproofing" flooring. Point out any defects you know of in such systems. 7. Write out a specification to govern the supply of cast-iron columns for a city warehouse. 8. What is the process and what are the objects of "killing" knots in painters' work, and is the process necessary with all woods? At what stages of painting are the operations of priming, stopping and flattening performed? State the object of each and the materials employed.

*Principles and Practice of Construction.**Examiners: Messrs. C. A. D'Ebro and John Little.*

1. A brick pier 3 feet square on plan carries a load of 150 tons. Show $\frac{1}{2}$ -inch section of the foundations you would use (a) in a stiff yellow clay; (b) on rock. Show your calculations and state the nature of material you would use in each case. 2. Show the timber centring (scale $\frac{1}{4}$ inch to the foot) you would employ for the elliptical arches of a stone bridge, the arches being 45 feet span, and rising 15 feet in the centre. Describe the arrangements you would make for striking the centres on completion. 3. Draw a plan and section to $\frac{1}{2}$ -inch scale, showing the construction of circular geometrical stone stairs 3 feet 9 inches wide, in a circular space 10 feet in diameter. The stairs to rise to a landing 9 feet from floor to floor. 4. A wooden bressummer is required to carry a wall 18 inches thick, weighing with floors and roof resting on it 12 tons, over an opening 15 feet wide. The depth of the beam is limited to 95 inches. Show how you would construct the bressummer and how you would satisfy yourself that your construction is sufficiently strong. 5. Sketch sections of the methods you would use to exclude the weather in making (a) a French casement window opening inwards; (b) a casement opening outwards; (c) a lifting skylight in a flat roof. 6. Draw to $\frac{1}{2}$ -inch scale (half section, half elevation and plan) (a) the cast-iron column; (b) the wrought-iron stanchion you would use to carry a warehouse floor 12 feet high, the weight on such floor being 50 tons, resting on a blue-stone base. Show the form of cap you would adopt in each case to receive cross-rolled iron joists and a superimposed column or stanchion. Figure your dimensions on plan.

*Drawing, Designing, Planning and Arrangement.**Examiners: Messrs. Anketell Henderson and Walter R. Butler.*

Subject: A two-storey brick parsonage for a suburb, with the following accommodation:—Ground floor: Dining-room about 22 by 15; drawing-room about 22 by 15; study, with outside communication, about 16 by 15; breakfast-room and nursery combined, 16 by 15. First floor: Four bedrooms and

perhaps one dressing-room, servants' bedroom, bathroom, &c. Site: Practically level, with 100 feet frontage facing east. Depth, say 265 feet. The candidate is requested to give reasons, briefly, for the arrangement adopted as to aspect of principal rooms and general arrangement. Also the candidate is desired to specially consider that economy of work and maintenance of the building is specially desirable in a parsonage.

*Specifications.**Examiners: Messrs. Koch and Fitts.*

Write specification of the following, relating to the building designed on previous day, viz. foundations, brickwork, roof covering and roof plumbing.

*Quantities and Estimates.**Examiners: Messrs. Percy Oakden and G. C. Inskip.*

1. Take off the dimensions for, abstract, and bring into bill the masons', bricklayers' and painters' work in the portion shown on accompanying tracing, showing all the processes. 2. If Oregon is to be supplied to you at an all-round price of 18s. per 100 feet sup., calculate the amount of the following order:—1 piece, 40 feet long, 13 inches by 10 inches; 4 pieces, each 25 feet long, 11 inches by 4 inches; 20 do., 20 feet long, 9 inches by 2 inches; 20 do., 18 feet long, 7 inches by $1\frac{1}{2}$ inch; 12 do., 15 feet long, 5 inches by 2 inches; 12 do., 15 feet long, 5 inches by $1\frac{1}{2}$ inch; 12 do., 10 feet, 4 inches by 2 inches.

*Professional Practice.**Examiners: Messrs. Percy Oakden and G. C. Inskip.*

1. In the R.V.I.A. conditions of contract give the spirit of the clauses dealing with (a) access of proprietor to the works; (b) alterations and extra works; (c) liquidated damages and extension of time. 2. What matters in the R.V.I.A. conditions are referable to arbitration, and under what circumstances? 3. Under the regulations of the Board of Public Health of Victoria state what exits would be required from public halls having a total floor area respectively of (a) 350 square feet; (b) 2,000 square feet; (c) 5,000 square feet; (d) 10,000 square feet. 4. Assuming in the case of (c) that 2,000 square feet are on an upper tier, what aggregate width of stair will be required? What are the regulations as to landings, handrails, triads and risers? 5. Suppose you have a clothing factory to erect in Melbourne which will employ forty females and twenty males. What are the requirements as to the workrooms in respect of (a) contents; (b) height; (c) ventilation; (d) sanitary appointments? 6. From the by-law of the City of Melbourne Building Act define the modes of ascertaining the following:—(a) The height of a building; (b) the area of a building of the first class; (c) the capacity of a building of the second class; (d) the number of storeys. 7. Define the following terms:—(a) Insulated building; (b) party arch; (c) street; (d) lane; (e) alley. 8. Suppose you have to erect a building in the city of Melbourne, consisting of offices, covering an area of 50 feet by 32 feet, and containing basement, ground floor and first to fifth floors. State the thickness of the external and party walls on each storey.

TESSERÆ.*Imitation of Greek Art.*

THE intense worship of the beautiful was the pervading spirit of Greek art, and though the magnificent picture found at Pompeii are the only remains of its painting by which we can form any judgment, and which possibly have as much resemblance to the pictures produced in the time of Phidias as the works of Mengs bear to those of Raphael, we may fairly conclude that the age which produced such exquisite example of poetry, sculpture and architecture as the ravages of time have spared for our delight was not deficient in equally great professors of the sister art. The very religion of the Greek originated in a deep love of nature, and their gods and goddesses were but the types of human attributes, whilst the same spirit permeated their mythology and the ideal beings which inhabited its shadowy domains. The powers of earth, air, water were embodied in human forms; the woods resounded to the voice of the unseen Pan and his joyous crew; each spring, each grotto and each fountain had its presiding nymph, and all these were but the embodiment of those feelings awakened in the mind by the particular character of the place. And however ridiculous in these days may appear their ideas of the spiritual world, they produced that earnest belief without which art fails to excite sympathy. For though as regards sculpture, and more especially architecture, the outward form of Greek art may to an unlimited extent be transmitted by imitation, its beauty can never be revived by such means. Sculpture proposes to itself the representation of the human form, and the development of beauty is one of its highest aims, but surely beauty, especially of the face, is of infinite variety, and may be said to be even local, and the representation of

national type in any country cannot be unworthy of that noble art. But whatever inferiority critics may discover in the sculptured forms of the Greek goddesses and nymphs of modern days, it is in painting that the efforts of art have been most unsatisfactory; and whether we regard the unimaginative productions of the Bolognese school, the coldly correct pictures of Nicholas Poussin, or the frigid and pedantic works of Mengs and David, we fail to discover the slightest trace of the poetry of the age they sought to illustrate; and notwithstanding the marvellous colour and richness of composition we see in the works of the greatest Venetian masters, we turn away from their illustrations of classical subjects with a regret that such high powers should have been squandered on such unpropitious themes.

Recesses in Rooms.

Several circumstances belong to recesses, which tend to modify their character. Besides those of plan, elevation and section, there are others, one of which is that of relative size as compared with the rest of the plan. Ordinary shallow recesses—which kind might be distinguished by the name of blank recesses, since they are little more than breaks in the wall, and do not at all affect the general plan of a room—hardly belong to the subject, since they admit of scarcely any variety. By recesses we here mean those which come under the denomination of exhedræ, tribunes, alcoves, and afford considerable additional space. In plan these may be either curved or rectilinear, that is, semicircular (like the tribune of a Roman basilica) or segmental, or else polygonal or rectangular, in which latter case the plan may be either a parallelogram or so deep as to be a perfect square. Neither are these the only varieties of plan, for in each instance the recess may be either simple or expanded, that is, wider within than the breadth of the opening towards the room. If the plan be curved it is usual to make the elevation in the form of an arch, either plain or decorated, in which latter case it is sometimes the practice either to continue the archivolt without any impost or to make it rest upon the entablature or capitals of pilasters. Elevations of this class, however, are only astylar; it is when columns come to be introduced into them that alcoves admit of so many combinations and so much variety of design. The usual mode is merely to separate the recessed part of the plan from the rest by a single line of columns, or rather by only two columns, forming a distyle in antis—that number being seldom exceeded, but it is by introducing columns behind and within—by extending the recess either laterally or in its background—by admitting light into it from above—that novel and scenic effects may here be produced almost without number. As regards utility and convenience, it is unnecessary to point out the advantage attending a deep alcove for the sideboard in a dining-room, communicating immediately with a staircase for the attendants, but alcoves and recesses add also to the commodiousness of other apartments—libraries, drawing-rooms, &c.—affording nooks for study or conversation apart, similarly to the spacious bays and recesses of that kind in Gothic mansions.

The Somerset House School.

In 1836 the Board of Trade recommended to the Treasury an application to Parliament for a grant of 1,500*l.* for the establishment of a school of design at Somerset House. It was proposed to entrust the management of the scheme to a council of competent persons, guided by such regulations as the Government should make for the proper expenditure of the public money. It was further proposed that the officers of the school should consist of a director, two masters, and one or more assistants; that the duty of the director or curator should be to select proper objects for the museum, to submit estimates of the expense to the Board of Trade, and to manage the system of instruction in the school; that the school should be open to all applicants upon payment of a small fee; that the museum should by degrees be furnished with books, casts, specimens, drawings and prints; and that exhibitions, premiums and nominal rewards should be introduced, as incentives to improvement. In partial conformity with this plan two schools, morning and evening, were opened in 1837. The fee payable was a monthly one, amounting (from the opening of the school to the end of the year 1838) to 16*s.* per month for the morning school, and 4*s.* per month to the evening school, and the number of pupils who paid these monthly rates varied from eight to twenty-five in the morning school and from eighteen to fifty-eight in the evening school. At the commencement of the year 1839 a reduction was made in the morning school fee from 16*s.* to 4*s.*, and in the evening school fee from 4*s.* to 2*s.* Mr Papworth was director of the school till August 1838, after which he was succeeded by Mr. Dyce.

Embossed Wood.

A process for embossing wood was communicated by a Mr. Straker to the Society of Arts in 1824. He observed that raised figures on wood, such as were employed in picture frames and other articles of ornamental work, were usually produced either

by means of carving, which was an expensive operation, or by applying to the plain surface of the wood ornaments cast or moulded in plaster of Paris or some similar composition, a plan which was not always available. His invention, which he proposed to employ either alone or in conjunction with ordinary carving, depended upon the fact that if a depression be made upon the surface of wood by a blunt instrument which will compress its substance without actually taking away any portion of it, such depressed part will again rise to its original level if the wood be subsequently immersed in water. He therefore proposed to draw the required pattern upon the surface of a piece of wood previously cut to the required shape, and then to apply a blunt steel tool, burnisher or die to all those parts of the pattern which were intended to be in relief, so as to form depressions in the surface of a depth equal to their required prominence. In doing this, care was taken by the very cautious driving of the instruments to avoid breaking the grain of the wood. The whole was then planed or filed down to a uniform surface, after which the wood was steeped in hot or cold water, by the action of which the parts previously depressed rose to their former height, and consequently formed an embossed pattern which could be finished by the ordinary operations of the carver.

Giacomo Quarenghi.

The Italian architect who was invited by the Empress Catharine II. to practise in Russia was at first a painter, like his father and grandfather. He studied under Raphael Mengs. But when he set up as an architect he is said to have been successful. But the Italian buildings he erected during the latter part of the eighteenth century have not yet been identified. Although Quarenghi obtained a very high reputation in Russia, his published designs afford very little evidence of superior taste or ability, or even of novelty in invention. Judged from them, he appears to have been a great mannerist, and to have bestowed very little study on his details, which, besides being nearly the same on all occasions, are meagre and poor, even to insipidity. In comparison with many of his countrymen, he may be said to have been pure in his style of composition, but his merits are little more than negative, for if there is nothing glaringly offensive in his productions, neither are they stamped by any particular beauties and merits. Like that of James Wyatt, his purity is for the most part only poverty, his simplicity only the mere antithetical fault to excessive redundancy of ornament. The grandeur of his buildings consists chiefly in their size, and in their being kept in bold masses; but if not broken up, neither are they finished. They have insulated columns and ample prostyles, porticoes Ionic or Corinthian, but frequently attached to buildings which are in other respects quite in a state of nudity—bare walls with holes in them for windows. Among his principal works are the Theatre of the Hermitage, the manège or riding-house of the imperial guards in the Isaac's Place at St Petersburg, the convent of Demoiselles Nobles, Prince Gagarin's palace, and the triumphal arch in honour of the Emperor Alexander, designed by Quarenghi, but not executed in stone till after his death.

Church-Scot in England.

In the early period of the Church there appears to have been a division of the tithes—either tripartite, one portion to the clergy, one to repairs of the church and one to the poor, or quadripartite, one to the bishop, the other three to the clergy, the church and the poor. That period was before the existence of parishes, when the only ecclesiastical division was the episcopal district or diocese, then called *parochia*. At that time the bishop resided at the cathedral church, together with his clergy, and on him devolved the duty of repairing the church, caring for the poor and supplying ecclesiastical ministry. It was then the duty of every Christian man to pay to the bishop not only the decimæ, or tithes, but also the *ecclesiæ census*, church-scot and the *nummus eleemosynarius* (alms money). The object to which church-scot was devoted is not known. It was also the duty of the bishop to admonish even the king that the churches be properly furnished, so that some other contribution seems to have been expected from the laity. There is no symptom that any alteration of usage occurred when the local endowment of churches was introduced. Church rates, or something equivalent, certainly appear to have been in existence as a payment by the laity, independent of tithes, in the time of Canute, whose sixty-third law, "*De fano reficiendo*," states that all persons ought of right to contribute to the repair of churches. Parishioners and occupiers of the land within a parish paid for the repairing, maintaining and restoring the body of the church and the belfry, the churchyard fence, the bells, seats and ornaments, and of defraying the expenses attending the services. The spire or tower was considered part of the church. The duty of repairing and rebuilding the chancel devolved on the rector or vicar, or both together, in proportion to their benefice, where they were both in the same church.

NOTES AND COMMENTS.

THE history of Geneva testifies that the city or town was at one time of a different character to what it is at present. CHARLEMAGNE respected it, and therefore he placed it under a bishop as an ecclesiastical prince rather than under a secular ruler. Subsequently there were contests between the town and neighbouring counts who claimed jurisdiction. Then the House of Savoy obtained the rights of the counts, and in theory, at least, Geneva owes allegiance to the family of the present ruler of Italy. A new era began for Geneva at the time of the Reformation. JOHN CALVIN found a refuge there in 1536. The bishop had already departed from the town. CALVIN in a year or two, on account of differences with the council, left Geneva, but he returned, and in 1541 he was the governing spirit there. An interesting question now arises, whether certain wall-paintings which have been disclosed in the Hôtel de Ville belong to CALVIN'S time, or were executed during the dominion of the prince-bishops. The paintings represent individuals who were mentioned in the Old Testament. One is MOSES, who bears a cartouche, on which is inscribed the text, "Thou shalt take no gift; for the gift blindeth the wise, and perverteth the words of the righteous." It is believed the councillors who exercised judicial functions once occupied the room in which the paintings were found, and, if so, a more appropriate inscription could not be quoted. In an historical sense the frescoes are interesting, and no doubt the Council of State will instruct M. GUILAUMET, the architect, to make arrangements for their preservation.

CONTRACTORS who claim a large amount of extras should always be cautious before they enter on law proceedings in obtaining evidence which will stand scrutiny. Otherwise they may find they have lost money rather than gained it. An instance has just occurred in connection with the Woking main drainage. Mr. WELDON, the contractor, claimed about 10,000*l.* for works and materials which were not included in the contract. The case was referred to arbitration, and after occupying seven days it was not completed. It was expected that several more days would be required before the award was given. Counsel for the contractor, however, recommended a compromise, by which the claim became reduced to 2,279*l.* 18*s.* 9*d.*, the sum being made up of 1,029*l.* 18*s.* 9*d.*, the amount entered in the certificates given by the engineer, and 1,250*l.* for extras. It was agreed that the amount was to be taken in full satisfaction of all claims and demands by either party against the other party, each party to bear his and their own costs respectively, and each party to pay one-half of the arbitrator's fee. As the contractor's expenses are likely to amount to about 1,000*l.*, it will be evident that not much has been gained by the law suit.

THE syllabuses of the Board of Education are worth careful perusal, for they show what is knowable in industrial art and in industrial science. They are like tables of contents, but they have a use for others besides students who take part in examinations. It is difficult sometimes to prevent science and art from overlapping in the work of the schools. Thus it is said, apropos of architecture:—"Students should never be allowed to evade construction difficulties by the use of concealed ironwork. If iron construction is used it should be confessed. But it will be much better that the students should fairly work out problems of construction in stone, brick or wood without iron. The same rule applies to half-timber work, which, if used at all, should constitute the real construction instead of being deceptively veneered upon or let into the true walls of brick or stone. But, considering the practical objections to half timber, even when real, it is better not to employ it at all." There is much to be stated in support of the official view, but we expect it originated in the circumstance that questions of strength have to be determined by a different class of officials who have no concern with building as an art. It is well to have it acknowledged "that it is idle to suppose that architecture can be learned from books and drawings, and that it must be studied from

real works." It is also laid down that in choosing subjects for architectural classes preference should be given to those which relate to the place where the school is and its industries rather than to buildings of a different class. The syllabuses for art help to show that a wiser notion of what is obtainable in the schools is now accepted.

It is inevitable that two of the spending departments of a Government cannot be induced to agree on any matter relating to finance, but the difficulty sometimes becomes absurd when exhibited on a small scale, as in a case which has arisen in Dorking. That picturesquely-situated town wants new municipal offices and a new post-office. It was accordingly proposed by the Urban Council that the two should be combined. Application was made in the usual way to the Local Government Board for permission to raise money to erect the dual building. This was refused because the Board possessed no authority to sanction loans for the construction of post-offices. The Surveyor to the Post Office, who had approved of the arrangements, seemed to think he would be able to get over the difficulty, but up to the present he has not been successful. The Local Government Board would, no doubt, be prepared to authorise the raising of a much larger sum than is now desired if it would be expended on a municipal building, but any scheme by which the burden of the outlay on the ratepayers would be lightened must be treated as unconstitutional and unwarranted.

ILLUSTRATIONS.

EMPORIUM ARCADE, NORTHAMPTON.

THE illustration shows the main front to the Market Square of the Northampton Emporium Arcade, which is now nearing completion, from the designs and under the superintendence of Messrs. MOSLEY & SCRIVENER, architects, Northampton.

The building extends over 300 feet from front to back, and has three outlets into Newland Street, in addition to the central entrance on the Market Square. There are upwards of fifty shops, the majority of which have basement and first-floor stores, and each shop has special access from the rear for the delivery of goods, &c.

On the first and second floors several suites of offices are arranged over the shops on the Market and Newland fronts, and also a gymnasium hall 62 by 34 feet, and some half-dozen rooms about 25 by 20 feet suitable for private clubs or societies' meeting-rooms. On the Market Square front is a capacious basement café restaurant, approached directly from the Market Square, with cooking kitchen and larder, &c. There is also a hairdresser's saloon, and complete public conveniences with lavatories, &c.

The materials used in the front are red local bricks with Weldon stone dressings, and an openwork parapet of York stone acting as a permanent sign showing the words "Emporium Arcade." The central entrance is of DOULTON'S Carrara faience in white, green and purple, to special design, and gives a note of colour to the lower part of the front. The woodwork is painted ivory white, with exception of the main shop-fronts, which are of teak French polished.

Mr. A. J. CHOWN, of Northampton, is the general contractor for the whole of the work; Mr. G. DEACON, of Northampton, for the patent glazing; Mr. RADFORD for wrought ironwork; Mr. A. MARRIOTT, of Higham Ferrers, for the heating installation; Messrs. WARD & Co. for the Granolithic floors, and the Bostwick Company for the collapsible gates. The building is to be lighted throughout by electricity.

CATHEDRAL SERIES.—CHICHESTER: INSIDE THE TRIFORIUM. LOOKING WEST.

GREAT QUEEN STREET (PENIENY'S) THEATRE.

STAINED GLASS IN ENGLAND SINCE THE
GOTHIC REVIVAL.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays
among French Cathedrals," &c.A BRIEF REVIEW OF ECCLESIOLOGICAL
PROGRESS, 1855 TO 1875.

(Continued from page 43.)

WE have lingered so long over the most sacred part of the church and its adornment with sculpture and needle-work, as to render our survey of the most important and interesting examples of mural, roof and other polychromatic decoration carried out in England between 1855 and 1875 a somewhat hurried one. If not equalling in extent works of the same kind executed contemporaneously in France and Germany,* it must be admitted that ours have been of a far higher order of art.

In France the revival of Mediæval art, beginning sixty

religious edifices is enhanced by being ourselves constantly invited to assist in their embellishment and repair.

In the department of artificial polychromy, the buildings which exhibit its application on the most extensive scale, because spread over the whole of them, are St. Stephen's Crypt, Westminster, restored under Mr. E. M. Barry's skilled direction in 1863-64 to something of its primal splendour,* and Worcester College Chapel, Oxford, while portions of buildings similarly treated and most deserving of mention are the chapter-house of Salisbury Cathedral,† restored by Mr. Clutton in 1856-57; the lady chapel of Chester Cathedral, the north transept of Hereford Cathedral, the decorative colouring being in each instance entrusted to Mr. Octavius Hudson; the lantern of Ely Cathedral, and the chapel of St. Andrew in Gloucester Cathedral, both by Mr. Gambier Parry.

In the decoration of large wall spaces the east ends of All Saints, Margaret Street, by William Dyce, and that of St. Alban's, Holborn, by Preedy, carrying out the views of Styleman Le Strange, but in modes diametrically opposed, undoubtedly occupy the foremost places.

CHURCH OF ST. MARY, ABERDEEN.
With Triptych by Mr. N. H. J. Westlake, 1864.

HOLY INNOCENTS, HIGHNAM, GLOUCESTER.
With Frescoes above Chancel Arch, by the late Mr. T. Gambier Parry.

years ago under Louis Philippe and continued with renewed vigour under the Second Empire, was prosecuted very materially under Government auspices, the vast works of cathedral restoration and embellishment in progress over nearly the whole of the country simultaneously being chiefly dictated by the political necessity of creating great public works to keep the strong and intelligent class of ouvriers quiet by employment. With us, on the contrary, everything in the way of cathedral and church restoration has depended upon private enthusiasm and munificence, with the result that interest in

Edward Armitage's figures of Christ enthroned amid the Apostles in the apse of the Roman Catholic church in Duncan Terrace, Islington,‡ executed early in the sixties, are invested with a dignity consonant with their position.

A little later is the artist's more widely-known fresco in one of the lateral chapels of the same church, and which was thus eulogised by the *Athenæum* shortly after its completion:—

* Some account of this interesting work was given in *The Architect*, October 5, 1900.

† In a former paper of this series the introduction of a very vivid green into the colouring of the choir roof, undertaken during the restorations of 1870-76, was remarked upon. In a very able paper on the "Iconography of the Chapter-house, Salisbury," contributed to the *Ecclesiologist* of April 1859, William Burges remarks upon the peculiar colour of this green, which was used through the chapter-house, as "most approaching the modern green verditer, but more brilliant."

‡ Already alluded to in these papers as the work of J. J. Scoles (1843).

* As, for instance, in the Sainte-Chapelle and the churches of St. Vincent de Paul and St. Germain des Près, at Paris; in the chapels encircling the choirs of Amiens, Rheims, and Coutances Cathedrals; in St. Denis; in the church of Bon Secours, near Rouen; in the great Cologne basilicas of Sta Maria in Capitolio, St. Martin and St. Cunibert; and in the cathedrals of Münster and Speyer.

"The figures are life-size; the subject, St. Francis of Assisi, in 1210, receiving the approval of Pope Innocent the Third to the Rule of the Order of the Frates Minores or Franciscans, as they are now called. Their founder stands, his head humbly bent, his hands held together before the enthroned Pope, who reads article by article the Rule of the Order. A monk on each side of the saint kneels, as do others behind him. The Pope is supported by a cardinal on each side, seated, all splendidly dressed. Attendants stand behind the throne. The scene is an open-sided hall in the Capitol, where the Pope is presumed to have lived at the period in question.

"Through the arcade we look over Rome and its ruins as in the thirteenth century. Following that sound rule of art which demands character everywhere, Mr. Armitage has given a portrait-like character to his heads, which, in the broad style he follows, individualises each figure and face and gives a striking look of truth to the whole. The expressions are effective, without anything of the theatre; the design, large and simple in composition, suits the subject and the material perfectly."

Of paintings which adorn walls above chancel arches Mr. Gambier Parry's in Highnam Church, near Gloucester; Mr.

But this, in the estimation of the critic just quoted, "is rivalled, if not surpassed, in excellence by that which is executed on the chancel wall," *i.e.* on the space above the chancel arch. Representing the Tree of Life as symbolised by the Crucifixion, the artist has approached the subject "in a manner befitting its dignity and pathos, neither aiming at unnecessary archaism nor adopting a mere pictorial and naturalistic treatment." Equally applicable are these remarks to Henry Holiday's graceful frescoes upon the eastern wall of All Saints, Notting Hill, that stately and abnormal church with which the late William White, F.S.A., made his *début* in London.

Two frescoes illustrating events in the Life of St. Stephen within the south chancel arch of the church dedicated to that saint on Sydenham Hill, by Sir E. J. Poynter; a series to be noticed with greater particularity hereafter, executed by Messrs. Clayton & Bell, in the apse of St. Peter's, Vauxhall; a frieze of saints upon gold grounds above the chancel arches of the Church of the Annunciation, Chislehurst, by Mr. N. H. J. Westlake; the effigies of various non-scriptural saints, by Mr. Daniel Bell, in the arcades which enrich the chancel walls of St. Mary Magdalene, Munster Square; and the late Mr. Alfred Bell's delicate figures of saints upon the gallery fronts at St. Andrew's, Wells Street, pretty well exhaust the list of

THE ANNUNCIATION.

(Portion of wall-painting in All Saints, Notting Hill, by Henry Holiday.)

Street's in All Saints, Boyne Hill, and SS. Peter and Paul, Wantage; Mr. G. F. Watts's in St. James the Less, Upper Garden Street, Westminster; Mr. Stacey Marks's in All Souls, Haley Hill, and Mr. Daniel Bell's (due chiefly to his clever pupil, Mr. George Parlby) in St. Paul's, Brighton, are among the more interesting and important, the subject in most cases being the Doom, or the somewhat analogous one, the Session in Majesty.

In 1870 Mr. C. E. Kempe painted on the west wall of St. John's Church, Tue Brook (a suburb of Liverpool), then just completed from the designs of Mr. Bodley,* a Tree of Jesse, which, says Mr. Eastlake in his "History of the Gothic Revival," "in composition, in delineative power, in judicious choice and association of colour, as well as in attention to the proprieties of costume and other details, is worthy of all praise."

* This church by its fourteenth-century English style, treated, however, in a manner quite *sui generis* by its architect, exhibited at the period of its completion a decided reaction from the French and Italian types of Pointed then so extensively in favour. Erected at the sole cost of Rev. J. C. Reade and Mrs. Reade, it is but one among the many and splendid instances of individual generosity that have characterised the great Church movement of the half-century just past.

works in the department of mural decoration carried out during this busy and eventful epoch in the history of revived taste as regards matters ecclesiastical.

Of roof decoration, of course, the most important example is that in the nave of the cathedral at Ely. Commenced in 1858 by Styleman Le Strange, who, three years earlier, had completed a grand figure of Our Saviour within an aureole, in the act of exercising creative power, upon the ceiling of the same cathedral's western tower, the present nave ceiling covers a high-pitched roof internally braced with a series of interlacing timbers in such a manner as to assume the form of an irregular polygon.

The painting upon it, executed *in situ* on deal boards nailed upon the old rafters, was completed as far as the sixth bay from the west at the close of 1861, when the artist laid aside the work *pro tem*, in order to devote himself to that series of subjects from the Litany which form so grand a feature of Butterfield's masterly church, St. Alban's, Holborn. The cartoons for this great work were as elaborate as those for Ely, but conceived in the style of a century earlier.

Before Le Strange could take up the broken thread in the grand Norman nave of the minster in the fens he was called away from earth, the work—a long symbolical tree of Christian

story, in rivalry of, but on a more gigantic scale than that at St. Michael's, Hildesheim, suggested to the artist by Dean Peacock as the model*—being carried on to completion at Christmas 1864 by his friend and admirer, the late T. Gambier Parry. Another example of roof painting which must not be overlooked is Sir E. J. Foynter's in the nave of that solemn Romanesque fragment, Waltham Abbey Church, executed in conjunction with William Burges, who early in the sixties was entrusted with its reparation. From the designs of Sir G. G. Scott, Mr. J. R. Clayton painted somewhat earlier on the flat roof of the apse at Peterborough Cathedral a grand calm figure of Our Lord in Majesty, surrounding Whom, in medallions placed among the branches of the vine on the pale blue ground of the ceiling, are half figures of the Apostles.

EASTERN PART OF THE NAVE ROOF AT ELY.

The same artist's roofs in St. James the Less, Upper Garden Street, Westminster, and St. Mary Magdalene, Paddington, both for Street, require to be seen under very strong conditions of light, especially the vaulted one of the chancel in the latter church. The chancel roof of St. Michael's, Brighton, interesting as one of the earliest efforts of Messrs. Morris, Marshall, Faulkner & Co., was executed for Mr. Bodley, by whom so wide a field was to be opened to a band of artists destined to completely revolutionise English art, whether of a religious or a secular character.

* This, however, has been disputed. The late Bishop of Carlisle, Dr. Harvey Goodwin, who was Dean of Ely 1858-69, and therefore saw this carefully studied epitome of the sacred history of man, as recorded in Holy Scripture, through every stage of its development, tells us on page 39 of his "Ely Gossip" that the scheme was not taken in any way from a foreign example, and that Le Strange had not seen the Hildesheim ceiling when his design was conceived. It is interesting to note that some of the faces in this gigantic work are portraits, that of Dean Peacock, for instance, being given to Isaiah. In that section of the roof which has been selected for illustration the three easternmost subjects—the Annunciation, the Nativity and the Adoration of the Shepherds and the Magi—are larger than those in the earlier or western portion, Le Strange himself having, as the work proceeded, realised that a grander effect would be produced by such an arrangement. Mr. Gambier Parry, therefore, in obedience to this intention of the original designer, wisely acted upon it.

KENT ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Kent Archæological Society was held this year at Maidstone, under the presidency of Earl Stanhope, lord-lieutenant of the county. The year's report, which was read by Mr. George Payne, F.S.A., stated that the Society was still in a most flourishing condition, and many of its more prominent members were steadily engaged in the great work for which the Society was founded. Since the last meeting the twenty-fourth volume of the "Archæologia Cantiana" had been issued. The cost of this volume had been defrayed, leaving a balance at the bankers, inclusive of the deposit account, of 635*l.* 7*s.* 8*d.* The Council had noted with much satisfaction the praiseworthy efforts of Mr. E. D. Till, of Eynsford, in preserving the remaining walls of Eynsford Castle. He had not only purchased the lease of the castle, but had expended a large sum in buttressing the tottering walls. The Marquis Camden had undertaken a sorely needed reparation of the magnificent ruins of Bayham Abbey, and Mr. Falcke had caused judicious repairs to be done at Allington Castle. Mr. F. S. W. Cornwallis, late M.P. for Maidstone, recently purchased the ancient college at Maidstone at a cost of 3,800*l.* for the sole purpose of preventing it being acquired for commercial uses or threatened with destruction. The Council were taking steps towards completing the inventory of Kentish church plate, commenced some years since by the late Canon Scott Robertson. It was hoped that the Rev. C. E. Woodruff, rector of Otterden, who had kindly undertaken to collect the returns, would receive the prompt assistance of those clergy with whom he had already communicated.

The Old Palace, Maidstone.

At the conclusion of the business meeting the members proceeded to inspect the building in which they were assembled, under the guidance of Mr. Hubert Bensted, architect, who read a brief paper on the history and architecture of the place. The manor, he said, had apparently in very early times belonged to the see of Canterbury, and appeared in Domesday Book among those held under the Archbishop. It must, however, have been alienated, for according to Phillpott it belonged in 1207 to William de Cornhill, or Cornhill, who presented it, together with the castle which lay on the south of the church, to Stephen Langton for himself and his successors. John Ufford began to build the palace in 1348, but died next year; Bradwardyne, his successor, scarcely survived consecration. Simon Islip, who followed him, carried out and completed Ufford's design, using, it is said, largely the material from a house which he pulled down at Wrotham. Courtenay, who made certain additions, died there in 1396. Morton had always been credited with having made substantial additions to the buildings, but recent discoveries would seem rather to point to his successor, Warham, as the builder, for on no less than three fireplaces, and those belonging to rooms of considerable dimensions, had the arms of that primate been discovered. Both manor and palace continued the property of the archbishops until Cranmer, by command of Henry VIII., granted them, together with the advowson and patronage of church and college, in exchange for other revenues. Henry very soon after gave them to his friend, Sir Thomas Wyatt, the elder, of Allington, whose son, Sir Thomas Wyatt, owing to the part he took in the rebellion, assigned them to the Crown. The palace, together with other premises in the town, was granted by Elizabeth to Sir John Astley, one of whose descendants sold it to Robert Marham, first Earl of Romney. Baron Astley was a famous general of Charles I. It is now the property of the town, having in 1887 been purchased by subscription as a memorial of the Jubilee of Her late Majesty, Queen Victoria. The Astleys built the east front, having first taken down that part of the older building, remains of the east wall of which still exist. Mr. Bensted, in conducting the members over the palace and buildings connected with it, drew particular attention to the remains of Early Norman masonry in the southern garden.

All Saints Church.

At the adjoining parish church of All Saints the members were received by the Rev. P. C. Joy, curate, who read a paper on the building written some ten or fifteen years ago by the late Canon Scott Robertson. This church, said the writer, was founded by Archbishop Courtenay, who obtained from Richard II. authority to pull down the parish church of St. Mary and to substitute for it the Collegiate Church of All Saints. Certain coats-of-arms carved upon the stall seats in the church indicated that the Archbishop was assisted with money for the work by his nephew and godson, Richard Courtenay, by another member of the Courtenay family, and by the wealthy and powerful foreigner named Guy de Mone, whom the Archbishop collated to the rectory of Maidstone in 1390. This rectory was then a rich benefice, sought for as a sinecure by powerful foreigners; but Guy de Mone was warmly attached to the Archbishop and to Maidstone, as well as to

John Wootton, the first master of the college. These two friends evinced a lively interest in the erection and completion of the church. Certain points in the edifice indicated that the builders began with the south-eastern portion. The internal decoration was not finished until several years after the death of Primate Courtenay. This was ascertained from an examination of the elaborately canopied sedilia on the south side of the chancel; the stones of which the carved work was composed ran completely through and were common to the sedilia and to the tomb of Wootton, who died in 1417. This tomb was built between 1407 and 1414, during his lifetime. The church was in full use years before the sedilia were inserted. The dimensions of the church were remarkable. It probably seated upon the floor-level more persons than any other parish church in the county. Yet it was not nearly as large as it was represented to be by the histories of Maidstone, which called it 227 feet long. The actual length of the church inside was 166 feet, the nave was 100 feet long, the chancel nearly 63 feet, and the space between the two was rather over 3 feet. Cranbrook Church was longer; so also was Lydd Church, while at Faversham and Minster-in-Thanel the churches were not 6 feet shorter. But the great width of the church was its peculiar characteristic. The nave of Rochester Cathedral could almost be put inside this church. Its great width enabled the nave with its aisles to contain sittings for 1,400 people; the chancel could seat 200 more; and it was said that 2,080 persons were once accommodated. In the way of accommodation Faversham probably approached Maidstone most nearly. Faversham Church contained on the floor-level sittings for 1,400 people, and its area was 11,060 square feet. Internally, greater uniformity of design and better light were found in All Saints, Maidstone, than were usual in Mediaeval churches. It was an admirable example of the early period of the Perpendicular style of architecture. The noble arcades were continuous from east to west, having six bays in the nave and three in the chancel. The windows were twenty-four in number and contained 101 lights. Breaks in the uniformity of the church were caused by the width of the aisles being less on the south than on the north, and in the nave this contraction of width was found to run continuously across the church, so that the north aisle was wider than the nave itself, and the nave was wider than the south aisle. The singular position of the tower further broke the uniformity of the church. It stood on the south side, outside the south aisle, against the second bay from the west end. There was no lofty arch opening from the nave into the tower, but simply a large low doorway. Upon the whole it must be acknowledged that very few churches existed of such size as this, or in which the shafts, piers and abutments were so little obtrusive, and where the masonry so little obstructed either sight or sound. The continuous character and elegance of the moulding around all the arches should be especially noticed. This distinguishing feature of the Perpendicular style was very prominent here. The absence of capitals was remarkable; it increased the light and elegant appearance of the arcades, but he (Canon Scott Robertson) doubted whether the design was not too uniform and too elegantly light. Justice to the original designer, however, required that they should remember that several important accessories of his work had been destroyed. The roof and ceilings which he designed were quite gone. The rood-screen with its panels brightly coloured was also gone. The door of the entrance to the rood-loft still remained in the north wall. The upper door, which gave access from the turret to the rood-loft, was now blocked up and plastered over. The rood-screen enclosed spaces for two small chapels. Within each enclosure an altar stood. Another lost feature in the original plan was the illuminated screenwork, which undoubtedly divided the high chancel from the side chancels. The altar in the south chancel was called that of St. Thomas the Martyr, and that in the north aisle might have been dedicated to St. Mary. It was believed that the north chancel contained an altar dedicated in the sacred name of Jesus our Lord. The high altar was dedicated to All Saints. The tomb of John Wootton had lost much of its beautiful colouring, but some of it still remained. East of this tomb was a squint, or hagioscope, upon a high level. The sedilia were originally more handsome than any others in Kent. They comprised four canopied stalls, the work being elaborate and elegant beyond anything to be expected in the collegiate church of an ordinary town. The frequent presence of the Archbishop at service here no doubt accounted for the beauty of these sedilia; the Primates often used the church for ordinations and other ceremonies of importance. This likewise accounted for the large number of stalls in the chancel. The carvings beneath the seats of twenty of the stalls remained in their original state, and were all well executed. As in the old church of St. Mary so in the collegiate church of All Saints, there was some chapel or vestibule devoted to the purposes of what would now be called a Probate Court. All the wills of persons residing in Maidstone and the neighbourhood were proved here for several centuries. The

font was remarkable as being of antique octagonal form, and yet dating only from the time of James I. Upon its sides were carved the arms of the Astley family and of France, Scotland and Ireland quarterly, without the arms of England. It was singular that so remarkable an insult to the English nation should have been allowed to be set up in any English church. The Astley family, who gave the font, were commemorated by several monuments. The changes wrought in the church through its being used as a citadel of refuge by the Royalist troops in 1648 could not now be identified, and very little harm could have been done. Lightning or fire destroyed the lofty spire in November 1731; it was built of oak, covered with lead. The tower was 78 feet high and contained five bells and the morrow Mass bell in 1552; there were also six bells in 1667; a seventh bell was inserted before 1719, and probably an eighth was added in 1721. All were recast in 1784, and since then the number had been increased to ten. Galleries were erected in the church, one in 1667 on the south, another in 1714 on the north, and a third stood at the west end. Repewing took place in 1700, and the galleries were removed at different times. The ancient roof was taken off in 1793, and the existing roofs and ceilings were put on in 1793-94, at a cost of nearly 3,000*l*. A pulpit stood at the west end of the nave from 1692 till 1823, when it was removed. The new pulpit placed here in 1849 was now in Detling Church. The present stone pulpit was given by Mrs. Sweetlove, whose relative, the late Miss Sweetlove, gave the reredos. Gas was introduced in 1855, and regular evening service on Sundays was then commenced. The paper concluded with an enumeration of the stained glass and memorial windows in the church.

Leeds Castle.

By carriage to Leeds Castle was the first order after luncheon. On arrival the members were received by Mr. C. P. Wykeham-Martin and Mrs. Wykeham-Martin. The famous pile was described by Mr. F. V. James, F.S.A., curator of Maidstone Museum, who dealt with the castle more particularly as an illustrative example of the military architecture of the Middle Ages and of its strong position as a fortress. The castle was a very peculiar structure. It stood, he said, upon three rocky knolls, of which two were islands in a lake of about 15 acres in extent, and the third occupied the central part of the artificial bank by which the waters were retained. The island on which the keep or glorie was situated was thought to have been the site of an earlier stronghold, tradition stating that such a place existed as early as A.D. 857. This was, perhaps, a Saxon house of timber, but the oldest work now seen dated from Edward I., the chapel, judging by its style, belonging to A.D. 1280. The Normans probably took the Saxon forts as they found them, and the Norman shell-keep was constructed by changing the Saxon buildings of wood into fabrics of stone. In the reigns of King John or Henry III. a doorway in the gatehouse, the barbican and its wings, and the inner wall of the enceinte were, it is thought, designed, being portions of a definite plan which, once adopted, was deliberately carried out until finished. The lower portion of the old castle and the chapel were assigned to the period of Edward I., and the bretasce over the gateway was built during Richard II.'s reign, replacing an earlier one inserted by Edward I. and repaired later by Edward II. Extensive alterations apparently did not take place until the period of Henry VIII., when the upper storey of the old castle was formed. At this time, too, the Maidens' Tower was built. The actual date was not very clear, and although another building might have been standing in its place, there was no evidence to show that it was included as part of the fortress in times anterior to those of Henry VIII. Tradition supposed it to have been built for the maids of honour, and a later conception was that the appellation was a corruption of the word "main" or principal tower. Whilst in the possession of the Smith family of the Strangford ancestry an Elizabethan mansion was erected in the seventeenth century at the north end of the large island. In 1822 the present mansion was erected, during which many remains of the earlier structures were recovered. Near the Maidens' Tower, Mr. James remarked in the course of his paper, was a water tower with a very remarkable bath constructed for the use of Edward I. in 1291-92. It communicated with the lake by means of a passage in which were still to be seen the grooves of the portcullis. The water appeared to have been excluded or retained by means of an ingenious arrangement of flush-boards or sluices, which allowed of the cleaning of the bath without letting off the water of the moat. The area of the chamber equalled that of the hundred Reigate stones 2 feet square, specified in the accounts of Queen Eleanor's executors (A.D. 1291-93) as being obtained for use in its construction.

Leeds Church.

The parish church of Leeds, situated some little distance away, was next visited. The Rev. A. P. Morris (vicar) received the party, and an interesting account of the church was read by

Mr. George Payne. Mention was made, he said, of a church at Leeds in Domesday. Evidences of an earlier building existed in a row of clerestory windows, splayed outside and in with a groove in them for a shutter. The inner splays on the nave side were closed up, but those on the other side in the north aisle were still visible. This early church appeared to have been slightly shorter than the present nave, as the foundation of its east wall was discovered across the nave some distance to the west of the chancel steps. It had been presumed that in late Norman times the solid walls of the original church were pierced and an arcade introduced on either side, leaving the traces of the early clerestory above. The fine western arch, built entirely of tufa, belonged to this period. In the thirteenth century the massive tower was raised, as indicated by the narrow lancet windows in its north and west walls. The tower probably possessed originally a more lofty steeple than the present diminutive capping tower. In the thirteenth century the north aisle was also added, the nave roof being brought down to cover it. The south chapel was probably added at this period. Early in the fourteenth century the presumed Norman arcades of the nave gave place to those now existing. Judging by the windows and plinth the north chapel was added towards the close of the Decorated period. In each of the chantry chapels was a piscina; that of the south was a good example of Early Decorated work, and that in the chancel was more elegant. In the chancel there were three sedilia on the same level. Perhaps the grandest feature of the church was the magnificent rood-screen, which was of the Perpendicular period. It spanned the whole width of the church and consisted of eleven bays, each bay representing a four-light window. The screen supported a beautiful canopy, richly carved, the whole forming a glorious example of the wood-carver's art of the Middle Ages. The steps which led to the rood-loft existed in the south wall of the nave. The lower doorway was blocked up, and the upper one was doubtless still in existence, but had been concealed from view by modern plaster. In 1878, when the church was being restored, a remarkable discovery was made. Underlying the wall plates of the nave twenty-five jars of pottery were found on either side, embedded in the masonry 2 feet apart. He was of opinion that they were acoustic jars; they were from 10 to 12 inches in height, 8 to 10 inches in diameter, contracting to 4 inches at the mouth. In the bottom of each vessel was a cross-shaped or star-like slit of four points. The clay of which they were made was flecked all over with minute atoms of flint, a well-known characteristic of pre-Roman pottery. As the jars belonged to a much later period, it showed how careful one ought to be in assigning scraps of pottery sprinkled with flint to the Celtic period. Of the monuments in the church little need be said, as none were earlier than the beginning of the sixteenth century, and all the inscriptions were legible. The bells were of exceptional interest; the oldest was cast in 1617 at Joseph Hatch's foundry at Ulcombe, in which 155 bells were cast for Kentish churches. The large quantity of tufa used in the building would be noticed. It defied the elements, and was deposited by water highly charged with lime in solution. Until the time of Henry VIII. the canons regular of Leeds Priory were the officiating clergy at the parish church, but after the suppression provision was made for the ministration of the church by a small charge on the lessees of the confiscated priory lands. Queen Elizabeth improved matters by granting the advowson and revenues of the priory estate to the see of Canterbury. The clergy of Leeds were called "Archbishop's Curates" until 1843, when the ordinary title of vicar was adopted. The remains of the priory had, alas! totally disappeared. It seemed to have formed part of the appanage of the castle, and stood on the outskirts of the park. It was founded in 1119 by Robert de Crevequer and his son Adam, and in it were placed three Augustinian monks, who had already been attached to the chapel in Leeds Castle. The number was subsequently increased to eight canons under a prior, and had been further raised to thirteen at the time of the suppression. Excavations which the late Mr. C. Wykeham-Martin caused to be made in 1846 revealed part of the crypt and foundations of the apse of the priory church. Unfortunately, said Mr. Payne in conclusion, these explorations were not continued, but let them hope that some day the whole area which was once covered by the priory buildings might be systematically laid bare.

Battle Hall, Leeds.

Following the visit to Leeds Church a small party was conducted over Battle Hall by Mr. George Payne, who also described the house. The residence, according to Hasted, was in the time of Henry VII. in the possession of Robert Chambre, who, in the sixteenth year of that reign, released his claim and right to Robert Wotton, of Boughton Malherbe. It subsequently became the property of the Coverts of Leeds Abbey. Sir William Covert sold it to Mr. Harsnet; it passed through several hands until acquired by the Hon. Robert Fairfax, who resided here until he removed to Leeds Castle.

It afterwards became the property of the Rev. Dr. Denny Martin Fairfax. In the ancient dining hall was a beautiful decorated cistern and lavatory of carved stone. The bowl, which was the full width of the recess, was of Bethersden marble. Within the recess were two tower-like receptacles for holding water, which flowed through taps into the trough in front. Here those who were about to dine could wash their hands. The hall once possessed groining ribs of stone, which had disappeared, but the corbels and springers of the arched ribs remained. The late Rev. J. Cave-Browne seemed to have regarded this lavatory as a piscina, which might have come from one of the ruined chapels of the priory church, and he also considered the circular towers for holding water were later insertions into the niche. In an upper room in this house was a remarkable painting on panel in oil-colour. In the centre stood the Virgin holding the child Jesus in her right arm; on her right was St. Katherine with her wheel; beyond her was St. Agatha with the sword passing through her breasts. At the extreme right was a bishop with a crozier in his left hand and his right raised in the act of blessing. On the left hand of the Virgin stood St. George or St. Michael thrusting his spear down the throat of the dragon; next to him was St. Mary Magdalene holding the box of ointment, while the last figure on that side seemed to represent an ecclesiastic in full vestments. It had been conjectured that this curious painting might have come from the priory of Leeds.

Old Maidstone.

At the evening meeting a paper on "Houses of Old Maidstone" was read by Mr. Hubert Bensted. He remarked that quite a number of old houses had disappeared within his own recollection, notably Great and Small Buckland, of which a model was exhibited. This house derived its name from the tenure under which the land was at one time held. Among the Saxons "bocland," in contradistinction to the "focland," occupied by the common people, was devisable by will, and might be shared in equal portions among the children of the holder. The estate was in the time of King John granted by the Archbishop of Canterbury to Allan de Bocland to hold in frank fee. It was then described as one yoke and ten acres of land, with appurtenances in Maidstone. In the year 1270 it was in the occupation of Walter de Bocland, and a dispute as to its possession arose between him and his brother Allan, who brought the question before the Justices itinerant, and sought to obtain a moiety of the estate, the tenure of which had been changed by the archbishop without the consent of the Chapter of Canterbury. The plea, however, was overruled, and judgment was entered for the defendant. Buckland, of which 400 acres were in the parish of Maidstone, was in Henry IV.'s reign merged into the demesne lands of the college of All Saints, and on the dissolution of that house it passed to the Crown. It was granted by Edward VI. to George Brooke, Lord Cobham, whose grandson, in 1603, forfeited it for treason. His wife was, however, permitted to enjoy it for her life; and after her death it became the property of Robert, Earl of Salisbury. William, Earl of Salisbury, about the year 1618, broke up Buckland into three portions and sold them. That portion since called Great Buckland was purchased by William Horsepoole, who married a daughter of Lawrence Washington, of Jordans Hall, and in the reign of Charles II. it was sold to Sir John Banks, from whom it descended to the Earl of Aylesford, from whom it was purchased by Mr. R. J. Balston, of Springfield. Other fine examples existing within the memory of most were Bliss House in High Street (now the Post Office); Earl's Place in Earl Street, and to which it gave its name; a fine old mansion in Week Street, opposite Union Street and several old houses in the High Street. Fine old houses of which one read as standing in the first quarter of the late century included Sheales Court, south end of Stone Street, and at the opposite corner a "mansion-house with extensive surroundings." Adjoining on the north stood some ancient houses belonging to the Corporation (taken down in 1836). Lower down on the same side of Stone Street, *i.e.* the west, was "a very large old house of timber and plaster, temp. Henry VII." On the opposite side were Kingsley House and Jordans Hall, opposite to which stood "a large house." It was supposed by Mr. Clement Taylor Smythe that Henry VIII. might have stayed in this house, for the reason that his arms were found in plaster over one of the chimney-pieces and also in stained glass in one of the windows. A few yards further down was Stone House, retaining several good features, a fine fireplace, panelling and staircase. This house now belonged to the county, and was occupied by the judge of assize when travelling circuit. The two corner houses at the top of Gabriel's Hill had crypts vaulted with stone. The superstructure of the east corner house was gone; that of the west remained, but cruelly disguised. Some distance along Week Street from the south end at the beginning of last century stood "an ancient house, the entrance to which was through a large carriage gateway, which opened into a large and lofty hall." A house similarly described by Mr. Clement

Taylor Smythe stood a little further north, and yet further in the same direction was what the same authority described as "a very ancient house," with projecting casement windows extending from the top to the bottom storeys of the house. Adjoining this was (at the corner of Union Street) a house called Merchant Taylors. On the north side of Union Street (Tyler's Lane) stood the ancient manor house of Wyke, which gave its name to Week Street. On the west side of Week Street, opposite Union Street, was (to again quote Mr. Smythe) "a curious old mansion house;" a part of this remained, though much defaced, the bulk having been demolished a year or two ago, when handsome moulded oak-work was revealed. There was another large house (temp. James I.), where the Kent Club now stood. What Mr. Smythe described as "a very large mansion" stood by the water side north of Faith Street, "having many remains of Gothic arches, oriel windows, with trefoil heads and stone mullions." Earl's Place (already incidentally mentioned) again must have been fine, being "entered by a curious old gateway into a courtyard, and on the west side of which was a large lofty old hall, with immense windows, containing a considerable quantity of stained glass and shields of arms and devices." Opposite the house still stood, in a cruelly modern guise, the house of Andrew Broughton. Examples of an elaborate style of plasterwork were still to be seen in Bank Street and Week Street. The most important of the few houses that remained to them were in hands that would carefully preserve them. The Palace of the Archbishops and Chillington House (the building in which they were assembled) belonged to the town. The college buildings were lately purchased by Mr. F. S. W. Cornwallis, with the intention of preserving them intact. The remains of the southern gateway were, he believed, in the market, but their watchful secretary was taking steps for their preservation. The ancient building called Digons had become the vicarage house of All Saints, while the remains of Corpus Christi buildings were in good hands.

Boxley Abbey.

On the second day the first visit was to Boxley Abbey. Mr. George Payne gave a full account of the interesting discoveries recently made at the abbey. He remarked that the late Rev. J. Cave-Browne, in his work on Boxley parish, stated definitely that they might imagine the grand church of the abbey rose up on the south side of the garth enclosure, but there seemed to him (Mr. Payne) to be direct evidence that the church had existed on another spot. By the kindness of Major Best and the late Mrs. William Mercer, who then resided at the abbey, he was allowed to investigate the portions of the property he had in mind, and it was on a piece of ground at that time used as a potato garden that he found, 6 feet below the surface, the walls of the chancel of the church. At his suggestion Mrs. Mercer laid out the ground as a rose garden, the transept and chapels being marked by paths. Continuing his investigations, he came to the conclusion that the wall of the adjoining garden terrace was the original wall of the nave of the church, the plastering and whitewash still remaining. Towards the western end he found a large archway. This he was permitted to open up, with a remarkable result. The archway was entirely blocked up with the débris of Boxley Abbey right up to the crown, and when this was removed it was seen that the terrace, always supposed to have been built during the time of the abbey, was in reality the southern aisle of the Norman church. The débris consisted of pilasters, bases and capitals of columns, decorated fragments, and so on, many of these fragments being in a remarkable state of preservation. Epitomising the results of his investigations, Mr. Payne said the water garden occupied the site of the church, while the chancel, transept and chapels extended into the kitchen garden, the chancel being now covered with the rose garden. The lawn was the site of the cloister garth, around which were the cloisters. Under the raised bank about 10 feet from the surface of the garth, the mosaic floor of the cloisters had been found. The east side of the cloister now used as a kitchen garden was covered by a sacristy, cell, chapter-house and parlour. In what is now the Dutch garden with its fountain once stood the refectory and day-room. The kitchen of the present house was once the abbey kitchen. On the western side of the cloisters was the room for the lay brethren, over the kitchen offices were the abbot's quarters, and the dormitory was over the sacristy, the chapter-house and buildings being on that side. Over the east end of the chapter-house was the munitment-room; the great sewer still exists beneath the south wall of the abbey. The speaker next traced the ownership of the abbey from the Dissolution to the purchase of the estate by Major Best, of Park House. Several men of importance lie buried in the sanctified and beautiful enclosure of the abbey, including Robert Vineter, or Vyntier, the owner of the manor of Vinters. In the recently discovered archway were the fragments of a beautiful fourteenth-century tomb, but of the identity of this there is absolutely no evidence. Mr. Payne

described the seals of Boxley, and concluded, by reading Lambard's quaint account of the famous rood of grace of the abbey church. Mr. Seymour and Major Best were, on the proposition of Mr. Collyer Ferguson, heartily thanked for allowing the Society to visit and inspect the abbey.

Sutton Castle.

From Boxley Abbey the party drove to Sutton Valence, halting at Maidstone to pick up members who had journeyed to the town by train to take part in the second day's proceedings. In Sutton Valence recreation-ground, by permission of the Parish Council, luncheon was provided for the party, and after the repast Mr. Harold Sands read a brief paper on Sutton Castle, of which very little now remains in existence. No mention is made of any castle at Sutton Valence in the Domesday Survey, nor do the monastic historians speak of such a building. The castle, however, is supposed to have existed, and to have been destroyed in the time of Stephen. Kentish historians say little about it, and it does not appear to have played any prominent part in history. The ruins of the tower are 8 feet thick and about 30 feet high. From its resemblance to Peak Castle in Derbyshire Mr. Sands is inclined to attribute the fortress to the time of Henry II.

East Sutton Place.

By permission of Mr. R. H. B. Marsham, East Sutton Place, the seat of Sir Robert Filmer, Bart., was visited after luncheon. The members were conducted over the mansion by Mr. W. R. Ward, and Mr. Payne subsequently read some notes upon it. The manor of East Sutton, he said, belonged originally to Odo, Bishop of Bayeux, but it was confiscated to the Crown about 1084. Subsequent owners were John de Salario, who held it of Simon de Montfort, Earl of Leicester, in the reign of Henry III.; Geoffry de Martel, in the latter end of the reign of Henry III. and the beginning of Edward I.; Adam de Martel, whose right to it against the king was allowed by the Justices itinerant, 21st Edward I.; and Aymer de Valence, Earl of Pembroke, in the reign of Edward II. The last-named died in the seventeenth year of Edward II.'s reign, and his sisters became co-heirs. Isabel, who married John de Hastings, of Bergavenny, had this manor allotted to her, and with his descendants, Earls of Pembroke, it continued till, on failure of issue, it became the property of Reginald, Lord Grey of Ruthyn, as next of kin and heir of Aymer de Valence, in the reign of Henry IV. On Lord Grey being taken prisoner by Owen Glendower in Wales, Henry IV. in his fourth year granted license to Robert Braybrooke, Bishop of London, and others, to sell this manor towards raising a sum of money for his ransom. It was sold to Richard Brigg, Lancaster King-at-Arms. It alienated to Thomas Buttler and Thomas Bank (Henry V.); passed to the Darrells (Edward IV.); John York, of Ramsbury, Wilts (Henry VIII.); Richard Chilham, prior of Leeds Priory, for the use of his convent (Henry VIII.); Sir Henry de Guldeford, K.G., comptroller of the king's household (Henry VIII.); sold to Richard Hill (Henry VIII.); alienated to Thomas Lord Cromwell (Henry VIII.); it was exchanged with the Crown, where the fee of it remained till the king granted it in his thirty-seventh year, to John Tufton and Stephen Reavers to hold *in capite*. It was alienated to Thomas Argall in the same year. He procured his lands in Kent to be disgavelled by the Act of 2nd and 3rd Edward VI. and died possessed of it in the sixth year of that reign. His son and heir Richard married the daughter of Sir Reginald Scott, of Scott's Hall, in Kent; one of his daughters, Elizabeth, married Sir Edward Filmer, of Little Charleton, in East Sutton, to whom the manor was sold in the eighth year of James I., who removed from his seat of Little Charleton to the manor house of East Sutton, called East Sutton Place, where he kept his shrievalty in the thirteenth year of James I. The Filmer family was originally seated at Otterden, where Robert Filmer lived in the time of Edward II. His descendants continued there until Robert Filmer removed to the manor of Little Charleton. He was the father of Sir Edward Filmer, who purchased the manor of East Sutton. This Sir Edward had by his wife, Elizabeth Argall, nine sons and nine daughters, and died in 1629, being succeeded by his eldest son, Robert, who was knighted by Charles I. and resided at East Sutton. He was a prolific writer in defence of the rights of the Crown and was a great sufferer during the civil wars. His house was sacked ten times by the rebels and himself imprisoned in Leeds Castle for his loyalty. He married Anne, daughter and co-heir of Martin Hecton, Bishop of Ely. The following extract from Anne Hecton's diary still preserved at East Sutton gives some idea of the destruction of the screen and the fine window in the south-east chantry:—"July 27, 1643. Cornet May came to search East Sutton belfry for arms there; he tore the surplice with his own hands, took the Bible service book out of the church and broke down the screen and the painted-glass windows. Then went into Sir Robert Filmer's house, where he would not suffer the servants to be in the rooms where he searched, so that the

soldiers took divers things, what they pleased, and had the linen off every servant in the house except one." Robert died in 1653, being succeeded by his eldest son, Sir Edward Filmer, gentleman of the Privy Chamber of Charles I. and II. He died unmarried in Paris, 1668, and was succeeded by his next brother, Robert Filmer, barrister-at-law, of Gray's Inn. In consideration of his father's sufferings and loyalty he was created a baronet in 1674. East Sutton House is interesting principally for its fine tapestry in what is called the Queen's room, and for the old family portraits in the dining-room. There is a fine painting of King Charles by Sir Peter Lely in the dining-room. The entrance hall, music-room, library and dining-room on the ground floor and the tapestry-rooms on the second floor are situated in the ancient part of the house. On the motion of Mr. Payne thanks were accorded to Mr. Marsham and the agents of Sir Robert Filmer for permitting the Society's visit. Mr. Ward was also thanked for conducting the members over the house.

East Sutton Church.

The parish church of East Sutton was inspected under the guidance of Mr. Wells, who read a paper prepared by Mr. T. H. Oyler, whose absence through indisposition was regretfully alluded to. There was a church at East Sutton at the time of the Domesday Survey, but no portion of the original fabric can now be traced. The chancel and chapel on the north side Mr. Oyler considered to be beautiful specimens of the work of the latter half of the fourteenth century. The walls of the church are of Kentish rag. At the east end of the north chapel is one of the most beautiful Decorated windows to be found in the country. Very little of the stained glass remains, and the window generally is sadly in need of restoration. The general fabric was restored, mainly through the energy of Mr. W. R. Ward, a year or two ago, about 1,500*l.* being spent on the building to excellent purpose. Memorials of many of the families connected with East Sutton manor in past times remain in the windows of the church, the registers of which date from 1640.

Ulcombe Church.

A visit to Ulcombe brought the day's itinerary to an end. The Society was welcomed at the parish church by the Rev. Lord Theobald Butler, rector, while Mr. Walker read a paper prepared by the Rev. G. M. Livett, vicar of Watlington. Ulcombe Church is situated about 350 feet above sea-level, and on a clear day Fairlight Down can be seen from the porch. In the churchyard is a particularly fine yew-tree, the trunk of which measures 34 feet 6 inches in circumference. Mr. Livett describes the plan of the original church as an example of the style most commonly adopted by builders during the second half of the eleventh and the first half of the twelfth century, consisting of a nave without aisles and having a small arch in the east wall communicating with a narrow chancel. Certain portions of the Norman church still remain, notably a pillar on the south side of the chancel. Much of the present building belongs to the fourteenth century, including the chancel arch and the sanctuary. On the arcades of the nave there are more or less distinct traces of several fresco-paintings. Some memorials of the St. Leger family exist in the church. One is a stained-glass window in which the arms of Richard, Duke of York, father of Edward IV., are represented. There is also a monument to the Marquis and Marchioness of Ormond.

We are indebted for this report of the proceedings to the *South-Eastern Gazette*.

YORK ARCHITECTURAL SOCIETY.

THE members of the York Architectural Society went on the 10th inst. to Gilling, where, on arrival, the party wended their way along the woody eminence to the castle. On the eastern terrace, in front of the oldest portion, Mr. John Bilson, F.S.A., gave an instructive and interesting address on the building and its owners. In the basement is a blocked doorway, in the arch of which are shields bearing the arms of Etton, the then owners of Gilling. This doorway communicated by a central passage to rooms on either side, all having pointed barrel vaults. At the other end of the passage is a flight of stone steps which led to the upper apartments. A monument in the south aisle of the church may commemorate Thomas de Etton, the builder of this fourteenth-century tower house. From the Ettons the property passed into the hands of the Fairfaxes of Walton, one of whom, Sir William (son of Sir Nicholas, whose tomb is in the church, made considerable additions to the castle. To him is due the beautiful dining-room. In the eighteenth century the west front with wings was added from the designs of William Wakefield, architect, of York.

The party proceeded to the west front and ascended the steps to the entrance. In the hall an oak screen designed by the president of the society (Mr. C. H. Channon, F.R.I.B.A.)

attracted attention. The dining-room was entered, and its painted glass and heraldry described by Mr. Bilson. The room is perhaps the finest Elizabethan room in the country, and is 39 feet 5 inches in length, 22 feet 2 inches wide and 17 feet 3 inches in clear height. It is panelled in oak to a height of 12 feet, and there are seventy-five panels inlaid with varied ornament and enclosed by mouldings carved with egg and tongue ornament. Surmounting the panelling is a painted frieze on which is a series of trees representing the wapentakes of Yorkshire; on the trees hang shields of Yorkshire gentlemen living at the close of the sixteenth century who were entitled to bear arms. There are 449 shields in all, whilst beneath the trees are various animals. The frieze also contains three ladies playing lutes and three gentlemen viols. The room is lighted by three large windows enriched with painted glass depicting the Fairfax heraldry, and partly the work of Bernard Dinckhoff, 1585. The bay window emblazons the arms and descents of the Fairfaxes, that in the south window those of the Stapletons. Sir William Fairfax married Jane, daughter and heiress of Brian Stapleton, of Barton Joyce, Notts. The glass in the other window is of rather later date, and contains the arms and descents of the Constables. Sir William's son, Sir Thomas, first Viscount Fairfax of Emley, married in 1594 Katherine, daughter of Sir Henry Constable, of Burton Constable. The imposing fireplace is enriched with heraldry; at the top are the arms of Queen Elizabeth, in the centre the arms of Fairfax (with Malbis, Etton, Calthorp, Ayrum and Follifoot), also with crest and supporters. In the mantel panels are the arms of Sir William Fairfax's four sisters and their husbands. The ceiling is of plaster, ribbed, with pendants.

The basement was inspected, and afterwards the rooms of the later additions designed by Wakefield, including the beautiful long gallery. On the motion of the president (Mr. Channon) a hearty vote of thanks was accorded to Mr. and Mrs. Wilson for their kind permission in allowing the castle to be inspected, and also to Mr. Bilson for his valuable description of it.

The church was subsequently inspected under the direction of Mr. Bilson, and soon afterwards the party returned to York, after having a profitable and enjoyable outing.

HIGHER ELEMENTARY SCHOOLS.

THE Board of Education have issued the following rules as to buildings for higher elementary schools:—(1) Article 110 (6) of the Code limits the numbers of a higher elementary school to about 300. For such a school ten classrooms will generally be required, since every class should have its own classroom. Of the ten classrooms at least four should be suitable for a class of forty scholars. (2) (a) A classroom for forty scholars should have an area of about 620 square feet; a classroom for thirty scholars should have an area of about 480 square feet. (b) All classrooms must be furnished with single desks; the desks should be 2 feet long, arranged in pairs with intervals of 2 inches and gangways of 2 feet. (3) Every higher elementary school should be provided with suitable laboratories. (a) The laboratory accommodation must be sufficient to provide at one time for the largest class in the school. (b) There should generally be one laboratory for chemistry and one for physics. (c) A laboratory should afford 30 square feet of floor space for each scholar; the minimum size will therefore be 600 square feet, but it is as a rule desirable that the laboratory should be somewhat larger. If, however, the laboratory accommodates more than twenty-five scholars a second teacher would be required. (d) Laboratories must be fitted with suitable tables, which must be well lighted; they should be properly supplied with gas and water. For chemical laboratories, sinks, cupboards, and the necessary fume closets must be provided. (e) A small balance-room may be provided if desired. (4) (a) In addition to the classrooms and laboratories it is desirable that a higher elementary school should include at least one lecture-room, which should be fitted with (1) demonstration table furnished with a gas and water supply and a sink, and (2) a fume closet. A lecture-room should have an area of about 750 square feet. (b) A small preparation-room fitted with bench, sink, cupboard and shelves, and proper supply of gas, should be provided in a convenient position for the lecture-room. (5) A drawing classroom for the more advanced drawing is desirable. It should provide 30 square feet of floor space for each scholar; the best size will be a room with an area of 750 square feet. If suitably lighted the hall would answer for this purpose. (6) Other special rooms for cookery, laundrywork and manual instruction should be provided in accordance with the rules in Schedule VII. of the Code. (7) A higher elementary school may be planned with a central hall, but no class (other than drawing) can be recognised in such a hall. Good dimensions for such a hall would be 50 feet by 25 feet. As an alternative the hall might be adapted

for use as a gymnasium when occasion requires. Such a gymnasium for a school of 300 children should have a floor space of 1,800 square feet. The gymnasium should not be adjacent to the laboratories.

GOVERNMENT ARCHITECTS IN INDIA.

AN "up-country" contemporary has, says *Indian Engineering*, a prominent article in one of its issues on the above subject that has attracted no little attention. It is contended, as has so often been done by us, that Government has been negligent in the past in regard to architectural matters, and continues to be more or less negligent still. Sir Ashley Eden will always stand out as an exception to the rule, and it is no secret that Lord Curzon is struck with the indifference that is noticeable among the local governments in regard to all things pertaining to architecture. The dull Indian official grows up with an aversion in this direction, and by the time he is holding high position the aversion becomes deep-rooted. It is needless to say that this attitude is both unreasonable and unjustifiable, and though convenient to the individual because it saves time and trouble, is a positive misfortune to the country, and is the primary cause of the depression. Something decisive is called for. We already know that the India Office is taking steps to get some of the Coopers Hill men trained as architects, but it must be several years before that move can begin to bear fruit. Meanwhile there are certain officers whose capabilities should be fully utilised. This should be done in a liberal, sensible and encouraging way, and work should be steadily and consistently and not fitfully placed in their hands. Architectural art is not brought out in a mechanical way and to order when wanted, but is a thing of quiet growth requiring careful nurture; it improves by regular practice, even though there may be some risks and failures to be faced. It must not be subjected to severe restraint, but must have a degree of freedom. The architectural artist should be the pet of his community, but not at the same time the *bête noir* of his superiors.

ST. MARY'S HALL, COVENTRY.

THE Society for the Protection of Ancient Buildings has taken considerable interest in the repair of St. Mary's Hall, Coventry, one of the most valuable archaeological features of the city. After correspondence with the local authorities, arrangements were made for the visit of two representatives of the Society, Mr. Oliver Baker and Mr. C. E. Bateman. The report of these gentlemen has been adopted by the Society, and is generally favourable to the scheme of the work of repair which is being carried out. They, however, point out that:—"In the ancient kitchen, at the south end of the main building, which was probably the original hall of the guild, a corbel, once one of the roof timbers, having perished, another of white stone has been inserted. This new corbel has been carved to represent a grotesque head with conventional foliage copied from one in another part of the building. This carving seems to us unfortunate, as, so far as we noticed, the rest of this exceedingly interesting old room is genuine old work, or frankly modern arrangements for cooking, and it would have been better to put in a plain corbel, such as was needed to carry the old post simply as a piece of repair, grotesque heads having no meaning to us of these days, and copies being valueless." Satisfaction is expressed that electric light has been substituted for gas in the great hall, as the fumes of gas must be exceedingly bad for the priceless tapestry, especially that made about 1500, which fits the wall at the back of the dais, but it is regretted that the simplest possible form of electric light was not used.

GENERAL.

Mr. F. W. Hasluck, B.A., has obtained the studentship offered by the managing committee of the British School of Archaeology at Athens, tenable during the session 1901-2. The value of the studentship has for special reasons been increased from 50*l.* to 100*l.*

The Louvre has now received the valuable collection of thirteenth and fourteenth-century church ornaments bequeathed by the late Baron Adolphe de Rothschild. The room, for the fitting-up of which he also left 250,000 francs, will be opened to the public in a few weeks. The articles are eighty-seven in number, and fourteen others go to the Cluny Museum in Paris.

The Dover Corporation has purchased an estate near the municipal buildings for 6,500*l.*, in order to provide more suitable accommodation for the museum and possibly a free library.

A Permanent Ruskin Museum, organised by Mr. W. G. Collingwood, is to be opened at Coniston, Lancashire, on August 31, being the outcome of a successful Ruskin exhibition held there last summer. It consists of a large well-lighted room in connection with the Coniston Institute, and has been especially built for the purpose.

The French Government has approved of a scheme for the construction of a new tidal basin at Boulogne-sur-Mer. The estimated cost is 240,000*l.*, and the building operations are expected to extend to four years.

The Local Government Board have sanctioned the borrowing of 12,000*l.* by the Cuckfield Rural Council, for the erection from Mr. Hine's plan of an isolation hospital.

The Leeds and Yorkshire Architectural Society visited last week Wheatfield Lodge and Castle Grove, Headingley, both of which have undergone alterations and additions from the designs of Mr. Butler Wilson.

An Excursion by members of the Geological Society of Great Britain to Clermont-Ferrand has taken place for the purpose of investigating the geology of the Puy-de-Dôme. The members have been aided by MM. Glangeaud, Géraud and Boule.

M. Roland Knoedler, the well-known picture dealer of New York, who has been a Chevalier of the Legion of Honour since 1881, has been raised to the dignity of officer.

The Governors of the Northampton Infirmary have considered two schemes for the improvement of the infirmary prepared by Mr. F. W. Dorman. Scheme B, which was accepted, was estimated to cost 29,500*l.*, and comprises the erection of two new pavilions, the conversion of the present infirmary into a home for nurses, and a rearrangement of some of the officers' quarters—practically a new hospital.

The Consular Report on the trade of Germany states that in a new building attached to some boiler works in Upper Silesia a novelty in windows has been used. Light is introduced through the stone windows. The ordinary panes of glass were impracticable on account of the nearness of the works to the railway lines, so pneumatic glass stones have been used. From the outside the appearance is the same as the so-called "Butzen" panes. They are translucent, and at the same time as strong as the stone wall in which they are set. They will withstand any pressure or blow that the walls will stand.

The Worshipful Company of Plumbers should be well satisfied with the result of their efforts to improve the technical knowledge and skill of the working members of the craft. At the recent examinations held in London and the chief provincial centres upwards of 400 candidates were examined.

An Excursion Meeting of the Northern Architectural Association will be held to-morrow, Saturday, August 24. Members are to assemble at South Shields station at 2.45 P.M. upon the arrival of the 2.10 P.M. train from Newcastle. The following buildings will be visited:—Messrs. L. Wright & Sons' biscuit factory in Holborn (Mr. J. H. Morton, architect), new Higher Grade school in Osborne Avenue (Mr. F. Rennoldson, architect), and the Mortimer Road schools (Mr. J. W. Donald, architect).

Mr. Thos. B. Bumpus, of 4 St. Michael's Alley, Cornhill, will publish early in the autumn "Summer Holidays among 'The Glories' of France, being notes chiefly architectural upon the cathedrals and churches of Normandy, Picardy, the Domaine Royale, Champagne and Burgundy: Bourges, Chartres, Le Mans, Tours, &c." by T. Francis Bumpus, author of "London Churches, Ancient and Modern," "Ecclesiology Germanica," "Stained Glass in England since the Revival," &c., with fifty illustrations.

The New Police Station erected on the site of the old Grecian Theatre, Shepherdess Walk, was opened on Wednesday. The premises will accommodate about thirty-four police officers and men.

Hughenden Manor has been materially enlarged, the work having occupied between two and three years. It has been carried out at a cost of many thousand pounds by Mr. Coningsby Disraeli, M.P., who came into the estate in succession to his illustrious uncle. Architecturally, the mansion is of the Jacobean style, and the added portion has been executed in accordance with the existing fabric.

A New public hall at Llanfairfechan has been inaugurated by an official opening concert. The hall is 89 feet long and 50 feet wide, and has a stage with proscenium. The stage is 25 feet deep, 15 feet being behind the drop curtain and 10 feet in front, so that the latter part may be used alone for meetings and concerts, and the whole for theatrical purposes. The front block comprises two shops, with the entrance to the hall between them, and a council chamber and three offices on the first floor. Mr. Richard Davies, of Bangor, was the architect.

THE

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

LONDON.—Nov. 15.—Designs are invited for new offices for the Hearts of Oak Benefit Society in Euston Road. Premiums of 100*l.*, 75*l.*, 50*l.* respectively are offered. Mr. Sydney R. J. Smith, architect, 14 York Buildings, Adelphi, W.C.

PENZANCE.—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

SHEFFIELD.—Aug. 31.—Sketch plans, sections and elevations, &c., are invited for the alteration of the Ecclesall Church, i.e. the removal of the galleries, the reseating of the nave and the building of chancel, &c. Accommodation required for about 800. The Rev. T. Houghton, Ecclesall Vicarage.

Additional cost if wood-block floors, £89 16s.

TRADE NOTES.

THE Town Hall, Oakham, is being warmed and ventilated by means of Shorland's patent Manchester stoves, patent exhaust roof-ventilators and special inlet tubes by Messrs. E. H. Shorland & Brother, of Manchester.

THE heating of the new Primitive Methodist chapel, Holland Street, Hull, is to be by means of Spencer's patent "Ventilo" heating and ventilating radiators, supplied by W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, E.C.

THE Malvern District Council have just accepted the tender of Messrs. John Smith & Sons, Midland Clock Works, Derby, for a large clock with four dials, to be erected on the "Morris Tank," and the same firm are also making a large clock with four dials for the Salford cemetery.

ELECTRIC NOTES.

THE works in connection with the electricity supply scheme are now about to be commenced in the borough of Stamford. A convenient site for the works has been secured on the banks of the river, and the contract for these buildings will be

settled shortly. Mr. Warden-Stevens is acting as consulting engineer to the Corporation in the matter.

As directed by the Boston Town Council, Mr. A. Collins, A.M.I.C.E., London, has submitted to that body a report upon the electric lighting of the borough. Mr. Collins recommends the Council to adopt the continuous current distribution system. He estimates the cost of the scheme at 28,500*l.*, and a profit of 2,153*l.* when the works are fully loaded. He suggests that the Council should charge 4*75d.* per unit for private and 2*25d.* for public lighting.

At the monthly meeting of the Mansfield (Notts) Town Council, held on the 16th inst., general approval was given to the sketch plans of the buildings for the electricity works, and the engineer was instructed to get out quantities and advertise for tenders. The town clerk reported that the Corporation Bill had received the Royal assent, and it was decided to take steps to raise 50,000*l.* capital for purposes of electrical undertaking and refuse destructor. The following scale of charges was adopted for the supply of electricity:—For quarterly payments: For the first 100 hours' use per quarter of the maximum demand, private lighting only, per unit, 6*d.*; motive power only, per unit, 4*d.*; for the remainder, 2*d.* and 1*d.* For monthly payments: For the first 30 hours' use per month of the maximum demand, private lighting only, per unit, 6*d.*; motive power only, per unit, 4*d.*; for the remainder, 2*d.* and 1*d.* The minutes were approved.

THE new engineering scheme for the Poplar Union is now nearing completion. It will be remembered that this undertaking is of a special nature, and is, perhaps, one of the most important of any relating to a union. It embraces water supply, heating, electric lighting, electric power, hot water and steam supply, and includes the provision of new boilers, engines, economiser, steam turbines, centrifugal and 3-throw pumps, steam-jet plant, dynamos, motors, accumulators, main, distribution and power switchboards. Also deep wells and subsoil wells, water-pressure drums, air compressors, deep-well pumping plant, and important pipework and electrical distribution arrangements. The whole undertaking has been designed and carried out under the supervision of Mr. F. J. Warden-Stevens, consulting engineer, of Westminster, and no less than eighteen firms of manufacturers and contractors have been employed in supplying plant and carrying out the works. New buildings have been provided for the power-house, which is divided into boiler-house, pump-room, engine-room, accumulator-room, engineer's office and stores.

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light, and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

VARIETIES.

A NEW school at Kelvinside Gardens, West Glasgow, was opened on the 10th inst. to provide for the accommodation of the children residing in Kelvinside district. It cost 7,000*l.*, and is furnished with all the latest improvements, including electric light. It possesses three classrooms to accommodate in all 650 scholars.

THE new children's homes which have been erected at Outlane, a suburb of Huddersfield, were opened on the 10th inst. They have a south front, and are built on the farmhouse principle, having a large kitchen or living-room and a parlour into which the children can retire. There is ground at the back where they can play and take outdoor exercise. The upper floor is devoted to bedroom, bathroom and sick-room accommodation.

IN opening the new Floral Hall at Brighton, just erected opposite the Town Hall, the mayor (Alderman Stafford) mentioned that the charter to hold a market at Brighton was granted by Edward II., and he thought it was a happy circumstance that the newest market, of which the Floral Hall forms the first completed section, should be provided in the reign of Edward VII. Until the close of the seventeenth century the market was held on the beach. The Floral Hall is 145 feet long by 30 feet wide, with a glass roof. Space is provided for twenty-nine stalls, where flowers will be seen to advantage.

NEW schools which have been erected at Whitehaven, Cumberland, were opened on the 13th inst. They were erected from the designs and under the supervision of Messrs. Oliver & Dodgshun, architects, of Carlisle and Leeds, and are built

entirely of red stone from local quarries. There are two departments, a mixed school for boys and girls and an infants' school, each having separate entrances, playgrounds, cloak-rooms, &c. There are also comfortable retiring-rooms for teachers. The playgrounds are provided with covered play-sheds and latrines to each department. Each building has its own ventilating turret, with extraction-shafts from the several school and classrooms. The group of schools provides for nearly 500 scholars, about 160 being infants. There is a complete heating system, fitted up by Messrs. W. Richardson & Co., Darlington, and the schools are furnished in the most up-to-date manner. The work has been carried out by Mr. Edwin Moorhouse, contractor, Whitehaven, Mr. McGill being the clerk of works, and the cost has been under 5,500*l.*

THE Archbishop of York consecrated a new church at Swinton, near Rotherham, on the 15th inst. The site was given by Lord Fitzwilliam, and is situate at the Swinton end of White Lee Road. The new building is in the Early English style of architecture and is not yet completed. The finished portion consists of chancel and part of the nave, providing seating accommodation for about 200 persons. Underneath the chancel there is a parish room which will seat about seventy or eighty people. Local stone has been used in the construction of the building, and the roof is of pitch pine and open timber. The cost is about 2,300*l.* When the scheme has been completely carried out it is expected that accommodation will be found for about 450 persons. The site is large enough to embrace, in addition to the church, a Sunday school and vicarage house. The chancel of the church and the passages of the nave are all covered with a pleasing red pavement. The architect is Mr. J. D. Webster, of Sheffield, and the work has been carried out under the superintendence of his son, Mr. J. Douglas Webster. The contractors are Messrs. Geo. Longden & Son, of Sheffield.

IN the construction of the Talla waterworks the Edinburgh and District Water Trustees have been beset with a great deal of trouble and delay, but a fresh difficulty has unfortunately arisen through the collapse of a large part of the tunnel which will convey the water into Edinburgh from the reservoir a portion of the way. The aqueduct, which leads from the reservoir about two miles' distance, takes the form of a long tunnel, which was being constructed by Mr. Best, contractor, Edinburgh, under the directions of Mr. Tait, the Water Trust engineer. It is believed that owing to the pressure of underground water on the hillside the walls of the tunnel gave way.

Before the damage is made good the expense, it is estimated roughly, will exceed 15,000*l.* In the making of the tunnel a great deal of water was encountered, but it was thought that sufficient provision had been made for its escape both over and under the aqueduct. The works committee of the Water Trust held a meeting, when the mishap was under consideration. Without in the meantime fixing liability upon any of the parties concerned, it has been decided to ask Mr. Hill, C.E., Manchester, to report on the matter.

WE have pleasure in announcing the inauguration of the Society of Landed Estate Agents, the principal objects of which are (1) to promote and protect the interests of the profession; (2) to advise by mutual conference on all matters of practice relating to the management of landed estates; (3) to disseminate information by means of publications, correspondence, &c.; (4) to watch legislation on matters affecting the interests of agriculture and land generally, and (5) to provide a centre in London for members. The provisional Council consists of the following gentlemen:—Colonel Halifax Wyatt, for many years agent to the late Earl of Sefton, K.G., president pro tem.; Mr. E. F. Chamier, agent for the Rolle estates, North and South Devon; Mr. Dudley W. Drummond, D.L., J.P., agent for the estates of the Right Hon. Earl Cawdor, Sir James Drummond, Bart., and others in South Wales; Mr. Reginald C. Glanville, agent for the Antony and other estates in Cornwall; Mr. Godfrey Lipscomb, agent for the Margam estates, South Wales; Mr. E. G. Wheler, chief commissioner to His Grace the Duke of Northumberland; and the secretary (pro tem.) is Mr. William Broomhall, 16 Cockspur Street, Pall Mall, S.W. Membership is restricted to landed estate agents, their pupils and assistants.

BUILDING AND BUILDERS.

A NEW church for St. Mary's parish, Harrogate, is to be erected in the present vicarage grounds, considerable difficulty having been experienced in securing an eligible site elsewhere.

THE foundation-stone of a new school which is being erected at a cost of rather more than 10,000*l.* in Bursar Street, Cleethorpes, was laid on the 13th inst.

THE foundation-stone of a new church has been laid at Latchford. It will accommodate 600 persons, and its cost is estimated at 6,000*l.*

THE Gladstone National Memorial at Hawarden is now nearing completion, the roofing having been commenced. The building is to accommodate the St. Deiniol's Theological Library, and to cost 10,000*l.*

A NEW Sunday-school is in course of erection at Thurnscoe, Yorks, and the foundation-stone was laid on the 15th. The architect is Mr. E. Isle Hubbard, and the cost, exclusive of site, which is a gift, will be about 1,200*l.*

THE foundation-stones of the new Wesleyan chapel at Milford Haven were laid on the 15th inst. The site of the new building is in Priory Road. The structure has a frontage 39 feet 6 inches, and the estimated cost is about 3,000*l.*

THE foundation-stones of a new Wesleyan church at Helmsley were laid on the 16th inst. in the presence of a numerous company. The new building, which will occupy the site of the old one, is to cost about 2,000*l.*

THE contract for the rebuilding of the Oxford wing of Welbeck Abbey, destroyed by fire in October last, has been secured by Messrs. Troilope & Co., London. The contract is expected to be completed in two years, and 250 men will be employed on the works.

THE memorial-stones of a New Connexion church were laid at Bridgetown, Cannock, on the 19th inst. The new edifice is being erected on land adjoining the old chapel, built in 1865. It will accommodate 500 worshippers and cost upwards of 3,000*l.* The architect is Mr. A. Harrison, of Birmingham.

PLANS have been passed and a contract accepted for the erection of a Wesleyan chapel at Etchingam, Sussex. The designs are by Mr. A. R. B. Smith and provide for a structure with a frontage to the road. It will be a well-built chapel with an accommodation for 150 worshippers, and every regard will be paid to the requirements for which it is to be erected. The total cost is estimated to be from 600*l.* to 620*l.*

THE memorial-stone in connection with the Elland public baths, in course of erection on land adjoining the public offices, Elland, has been laid. The scheme, which entails an outlay of 6,000*l.*, has been entered upon at the express wish of the ratepayers as Elland's recognition of the Diamond Jubilee of the reign of the late Queen Victoria. The purposes committee of the Elland District Council was presented with a silver trowel by Councillor W. H. Eastwood, the chairman of the Council. The building, beside a large swimming bath, is to include Turkish and Russian baths, &c.

And every available example of Celtic*

*The wonderful durability of IRISH LIMESTONE
well-known.*

THE new school at St. Leonard's, N.B., is now nearly completed. The new building is being erected to the south of the present school—which is to be utilised as an infant department—and on the west side of the road, and lies between two proposed new streets on land belonging to the Earl of Elgin. The building is of one storey, having camceiled roofs, the windows rising up to the ceiling as half dormers above the eaves of the roof. The front elevation extends to 116 feet, and is flanked at both ends by teachers' rooms in two storeys forming quasi towers. The entrance doors face the west. In the centre of the building is a hall for drill, 64 feet wide by 25 feet, around which are grouped eight classrooms for sixty scholars each. The architect is Mr. David Barclay, Glasgow.

AT the monthly meeting of the Scarborough Town Council, Councillor Pirie proposed the minutes of the corporate property committee, which included "That the town clerk be instructed to prepare the necessary contracts for carrying out the work of converting St. Nicholas House into municipal offices, to get the same executed by the contractors, and to affix the common seal of the Council thereto, and that the borough engineer be instructed to have the work proceeded with forthwith." Alderman Land, who seconded the adoption of the minutes, said that the committee was unanimous in recommending that the work should be proceeded with at once. During the last eighteen years something like 3,200% had been spent in adapting the present town-hall for municipal offices. The recommendation of the committee was carried by fifteen votes to five.

MR. E. A. SANDFORD FAWCETT, the inspector appointed by the Local Government Board, held an inquiry on the 20th inst. at the Guildhall, Broad Sanctuary, Westminster, respecting the application of the Middlesex County Council to that authority for power to raise by loan the sum of 250,000% for the purposes of the new lunatic asylum which they propose to erect at Napsbury, St. Albans, Herts. There was no opposition to the scheme of the Municipal Council. The site has been already purchased at a cost of about 50,000%, and the foundations for the main building are nearly completed. The new asylum, which is much needed to relieve the pressure upon similar institutions in Greater London, will be constructed to accommodate a total of 1,150 inmates. It was elicited in the course of the inquiry that no part of the quarter of a million of money which it is proposed to be loaned to the Middlesex County Council shall be applied to the payment of the cost of machinery. That authority is applying to borrow the money

on account of the cost of construction of the building, although it is not unlikely that it may exceed the sum named by a hundred pounds or so. On the completion of the inquiry the inspector intimated that he would make his report to the Local Government Board with as little delay as possible, in order that the building operations might not be unduly retarded.

A LOCAL Government Board inquiry was held in the Board schools, Cold Ashby, Northants, on the 14th inst. by Lieut.-Colonel A. C. Smith, R.E., inspector to the Local Government Board, with respect to the application of the Brixworth Rural District Council for sanction to borrow 350% for the purposes of sewage disposal and the erection of filter tanks. There were present the Rev. Canon Bury (chairman of the Council), Mr. J. H. Smeeton (vice-chairman), Mr. W. C. Woodford (clerk), Mr. A. Lewis (surveyor), Mr. T. F. Hazelhurst, Mr. Wickes, Mr. Gilbert and Mr. Gardner. The population of the parish was stated to be 258, and the area 2,076 acres. The assessable value was 1,550%. There were 68 inhabited houses, and there were no outstanding loans. The surveyor then explained the scheme. The outfall at the south end of the village was to be conveyed in 9-inch socket pipes to a piece of land in the occupation of Mr. T. F. Hazelhurst. The land, which was three-quarters of an acre in extent, was to be drained, levelled, fenced and laid out as a filtration bed. To the south-west of the village there was no land available, and two filter tanks would therefore be built and the effluent carried to the watercourse in socket pipes. There was no opposition offered to the scheme, Colonel Smith afterwards inspecting the site for the bed and the tanks.

AUSTRALIAN HARDWOODS.

MR. H. B. LEFROY, the Agent-General for Western Australia, writes:—"At its last meeting on August 1 the Council of the City of Westminster decided to proceed with paving to the extent of over 130,000 square yards, of which about 110,000 yards is to be laid down in wood, involving a cost to the ratepayers of over 70,000%.

"At that meeting I learn the Council decided to award the contract to American red gum and creosoted Swedish yellow deal.

"My Government has spent large sums of money in demonstrating the special merits of Australian hardwood for street-

paving, and my predecessor, Sir Edward Wittenoom, K.C.M.G., published a pamphlet last year giving in a condensed form the opinions of competent surveyors and engineers in all parts of the United Kingdom, forming an overwhelming mass of testimony that 'Western Australian hardwood blocks, well cut, true to gauge, laid on an efficient system, and carefully supervised, both during and after laying, constitute for city and suburban thoroughfares the best paving known.'

"Copies of this pamphlet and any information about Western Australian hardwoods may be obtained at this office on application, and I would earnestly submit that the rate-payers of the City of Westminster should not rashly embark on an untried experiment with a foreign wood to such an extent while thoroughly tried material from another part of the British Empire can be put down at less ultimate expense.

"As the passing of this contract was not fully recorded in the recent issues of local Westminster papers which usually contain complete reports of the proceedings of the Council, I ask your kind insertion of a suggestion that, before adopting what appears to be an undertaking of an experimental character, a full statement of the reasons for abandoning what most surveyors consider the best-known paving be laid before the community at large."

CORRESPONDENCE.

Glasgow Exhibition.

SIR,—The executive committee having now decided—owing principally to the lateness of the season—not to adopt the scheme of mechanical ventilation of the Machinery Hall itself agreed upon with ourselves in May last, but instead to merely ventilate the large steam pipe trenches under the floor of the hall by Blackman fans, run by electric motors, we think it only right that the public and the Machinery Hall exhibitors should know how the whole matter stands at the present time. The original scheme of mechanical ventilation arranged for precluded the probability of disagreeable draughts being caused in the Machinery Hall, whatever the state of the atmosphere might be. The main supply of fresh air was intended to be drawn in from the high centre roof all along under the 500 feet length of ridge. The extraction of the vitiated air was to be induced by the thirty-one large Blackman fans (placed principally on the side walls about

15 feet high from the floor), and running at a fairly high speed, and delivering the air in volume outside at a very low-water gauge. By this simple but effectual method the whole air contents of the Machinery Hall would have been constantly changed and changing every four minutes, while even when the air outside got cooler (as it has been for about a week past) no down draughts would have been caused, owing to the considerable heat, always beneath and ascending, sufficiently warming the incoming air from the high roof before it got, say, within 10 feet of the floor. Besides, everything would have been under control and regulation, with the air in the hall always fresh and free from damp and dust. The plan of so-called natural ventilation, however, first temporarily and now permanently adopted for the Machinery Hall proper, consists in making as many new louvre apertures as possible in the roof and side walls, the opening up of the upper parts of the gables by the removal of all the glass at both ends, and the making of large openings in the end furthest from Dumbarton Road, making all the side windows to swing open, keeping all the big doors wide open, and thus practically throwing the whole place open to the outside atmosphere, with all its chance dampness and dust. Under the short spell of cooler weather at present experienced the draughts from these openings are most unpleasant and dangerous for the attendants near, and who cannot move away from them. With cooler weather outside and in the evenings later in the season these evils will be intensified. In view of this change of procedure without our knowledge, the writer came down from London in order to come to some understanding with the executive committee, whom we must free from blame, and who were surprised that the scheme of mechanical ventilation as agreed upon long ago with ourselves had not been carried out. We have arrived at an equitable settlement with the committee, who have met us in a most gentlemanly manner in the circumstances. We can only add that, even up till a few days ago, we have in vain done our utmost to get some effective scheme of mechanical ventilation for the Machinery Hall itself carried through, and we can now only leave the matter where it is and in the hands of the exhibitors concerned.—We are, &c,

YARDLEY MUNICIPAL OFFICES.

THE Yardley Rural District Council are erecting an imposing building as a dépôt for public works, and it will be ready for occupation shortly. It stands on the Stratford Road at Spark-hill, near St. John's Schools, and its proportions and situation render it a conspicuous object. The building has a handsome appearance. The materials are thin red-sand bricks with white points and dressings of Pillough stone. The windows are stone-mullioned, and have wrought-iron casements fitted in with glass in broad-leaded squares. The roof is covered with Cotswold stone tiles, and is surmounted by a well-proportioned clock tower 80 feet high with four openings 6 feet in diameter for clock dials. The Council a short time ago decided to defer the purchase of a clock, being anxious to limit the expenditure on the building for the present, but the difficulty has been got over by the liberality of an anonymous donor, who has undertaken to put in a clock with four dials at a cost of 300*l*. This will be a great advantage to the neighbourhood, which hitherto has been without a public clock. The offices block facing the Stratford Road has on the ground floor clerk's general office, with private office and strong-room; surveyor's office, with private office and store-room for plans; rate collector's office, with private office and strong-room; and sanitary inspector's office and store. There are two main entrances, one of which communicates directly with a spacious stone staircase leading to the council chamber and committee-rooms on the upper floor. The council chamber is 50 feet by 27 feet, and is arranged in the centre of the building. This room has in addition a semi-circular bay. The roof is open-timbered, the walls are lined with wood, and the chimneypieces are of wood and stone. Two committee-rooms, 32 feet by 20 feet, are provided, one at each end of the council chamber, and are similarly treated. There are also provided on the same floor the chairman's private room, two retiring rooms, with lavatories, and the surveyor's drawing office with north light. At the rear of the offices, and with an entrance to the side road, are placed the fire station dépôt, mortuary and caretaker's house. The fire station has accommodation sufficient for two engines, stables for two horses, mess-room and ambulance house. The dépôt consists of stabling for nine horses, two isolated loose-boxes, harness-room, mess-room, fodder store, cartsheds, wheelwright's shop, smithy, store and lamp-room, all enclosed in a large yard. The mortuary has a north top light and inspection lobby, with airtight glass inspection window. The cost of the

buildings, including the furniture, is about 13,000*l*. The architect is Mr. Arthur Harrison, of Colmore Row, Birmingham, and the work has been carried out by Mr. William Bishop, of King's Heath.

SAND BRICKS AND SAND STONES.

QUITE recently sandstone bricks, manufactured by the Schwarz process, have been brought on the market to challenge ordinary clay bricks. They are made of silicious sand and lime. The process is said to be specially valuable in localities where stone quarries or clay beds are scarce, and where, on the other hand, sand and lime are abundant. In this process from start to finish machinery alone is used.

The main factor in Schwarz's process consists of a vacuum heating and mixing machine. The sand is first introduced in measured quantities into this machine, which is heated by steam at a constant temperature. Thus the moisture in the sand is evaporated, and is besides removed from the mixing machine by means of a vacuum pump attached thereto.

Subsequently powdered quicklime is added in a ratio of from 2 to 6 per cent, measured exactly according to the sort of sand employed. The quicklime slackens so actively that all remaining moisture disappears in a very short time.

A measured quantity of water is then added to the dried mixture of lime and sand, and under the influence of the heating steam a chemical combination of the silica and the lime, viz. the hardening, begins in the warm mass. All other chemical combinations, as, for instance, that of lime with atmospheric carbonic acid gas are avoided, as the operation takes place in vacuum, thus preventing any exterior atmospheric conditions interfering with or in any way modifying the process. *En résumé*, the claims of this heated vacuum mixing machine are:—

1. By its use bricks can be made every day of the year, equally in dry as in wet or cold weather.
2. Its principle of employing both heat and vacuum obtains the most perfect results regarding its outturn.
3. It is fitted and so regulated that with duly measured mixtures of lime and sand its average output year in, year out, is as absolutely homogeneous as human agency could ever cause an artificial stone to be. Upon leaving this machine the mixture falls automatically into the hydraulic or other presses, from which the bricks are then carried on specially-constructed trollies into one or more hardening boilers, and after from six

to fifteen hours' time the bricks can be withdrawn therefrom quite ready for sale and use.

4. This process is also suitable to the manufacture of artificial coloured stones.

5. All the operations being mechanical great saving in manual labour is effected by this system. According to the number of presses used, in a day of eleven hours' work anything between 10,000 and 30,000 bricks can be produced.

6. The bricks produced resemble stone, their colour may vary according to the sort of sand employed in their manufacture, they can practically be made any colour, they do not readily absorb water, they resist also the action of acids, their shapes are very neat and regular, their surface extremely smooth and their angles very neat.

Of the validity of these claims we are unable to speak from personal experience: other sand bricks which have been introduced, have not, we believe, achieved much success. If this process is really an improvement on its predecessors we shall be glad to improve our acquaintance with it.

MARINE DRIVE, SCARBOROUGH.

IN response to a letter from the town clerk inquiring if they had any reasons to give why the penalty of 50% per week for the non-completion of the Marine Drive contract should not be imposed, Messrs. B. Cooke & Co. have replied to the effect that they had received copies of the resident engineer's report, and they regretted that they were unable to agree with many remarks made therein, and pointing out that before Mr. Everett made his report, dated September 1, 1899, he consulted them with reference to time lost, and found their figures correct, but they were not aware of his having agreed to a further period of twenty-four weeks, as stated in Mr. Beard's report of April 1, and also that they were not aware of having laid any figures before Mr. Beard, as stated in the same report, nor had they been consulted upon the matter; that they did not agree with these reports respecting loss of time owing to weather and bad tides, and that they had kept a diary on the works and noted down daily when they were unable to work, and therefore they were in a position to substantiate the figures as stated in their letter of June 15, and further stating that with reference to the remarks contained in the town clerk's letter of July 15 they did not acknowledge that the Corporation had any right to make deductions owing to the contract not being

completed, as, in the first place, the time to be extended for bad weather and tides had not yet expired, and that there were other matters which had taken place for which they were not responsible and over which they had no control, and that they were further of opinion that the suspension of their certificates was contrary to the conditions of their contract. The letter was referred to the resident engineer to report upon.

AUSTRALIAN TIMBER AND TIMBER-GETTING.

THE timber resources of the Australian Parent State, although largely wasted in the past, are yet of a most extensive character, and under a proper system of conservation would become as valuable as any in the world. In a report by the Queensland Inspector of Forests, descriptive of a visit to New South Wales, that official states that on the Murray River dividing New South Wales from Victoria are situated the far-famed Murray River gum forests, the area of forests extending a distance of about 200 miles on the frontage of that river, but with occasional breaks, and running back from the river on an average of from one to six miles. New South Wales has an area of about 140,000 acres reserved for this timber, most of this country being liable to floods and densely timbered with gum, from the matured tree to the sapling and small plant. As showing the extent of the timber trade in the district, it may be mentioned that during the season December 1900 and April 1901 the quantity of timber obtained was 5,593 logs, containing an average of 1,150 superficial feet per log, equal to 6,431,950 feet of timber, on which royalty is payable of 4,047*l.* *os.* 5*d.*, at 1*s.* 3*d.* per 100 superficial feet. The greater portion of this timber was cut on behalf of a Victorian company, and is stacked in depôts on the higher banks of the Murray River, pending a rise of water, when it is removed by pontoons and punts, towed by small steamers to Echuca (Victoria), where it is cut into sleepers, mining timbers and for bridge and building purposes. The system of working is that any person desirous of cutting gum must apply to the State head forester for a permit, for which he pays 10*s.* per month, and may employ as many men as he may desire, giving to each a certificate that he is so employed. The State head forester allots a certain portion of the reserve on which the permit may be used, and as the timber is cut it is branded by the Crown at the stump, both log and

stump being branded with white lead, each with a running number as well as with its length and circumference, a sub-forester entering every such log in his book for the State head forester's information. The timber is then removed to the river depôt, and if left in the depôt for three months royalty must then be paid thereon. For instance, timber removed to the depôt in January would require to be paid for at the end of April, and if not removed after the royalty is paid the owners must still hold a permit costing 10s. per month. No Murray River red gum is allowed to be cut under a circumference of 7 feet 6 inches at 5 feet from the ground, but small timber for piles, girders, &c., can be obtained at 15s. each up to a length of 30 feet, but above such length 6d. per running foot is charged. For the purpose of assisting in the production of this timber a system of thinning-out and cleaning-up of the reserves is adopted, and about 25,000 acres have been dealt with, on the following lines:—1. Gangs of men, about twelve in each gang, are employed under an overseer, at a wage of 7s. per diem to the men and 8s. to the overseer, to ringbark any large and useless trees and to thin out waste or crooked saplings, the latter being rooted out, and as this is done all fallen timber is gathered in heaps and burned, thus cleaning up the reserve. This work costs from 6s. to 10s. per acre. The outlay may appear heavy, but it is most valuable for the following reasons:—1. It prevents the destruction of numberless plants, saplings and trees by fire, through the fallen timber making a far larger volume of fire than the grass alone would make. 2. The destruction by ringbarking of useless timber and the cleaning by fire is found to produce numberless young gum plants, and to greatly increase their growth. 3. As each tree or sapling fit for cutting as a pile is worth at least 15s., the cost of the work is not to be compared with the future benefit to the State therefrom. 4. The cleaning-up of the reserves, which are in many parts let at a rental of 3d. per acre for grazing, tends towards obtaining a higher rental by the increase in production of grass for pastoral purposes. 5. The dead trees and logs being cleared enables the timber-getters to work more timber. 6. From examination of portions of the reserves before and after thinning out and clearing up, and from the healthier appearance of the young trees on the cleaned areas, in comparison with those uncleaned, and which it is considered is due to the trees obtaining a larger proportion of air, light, moisture and growing space, it appears that the work will be reproductive and greatly assist to maintain an ample and permanent supply of matured timber.

ZIFTA BARRAGE.

NINETEEN hundred and one has seen considerable progress made with this undertaking, which is one of the chain of works dependent on the great dam at Assuan. It is a barrage of similar nature to those existing near Cairo, and to the one being built at Assiout. The canals taking off at the Cairo barrages for the supply of water to the northern parts of Gharbia and Dakahlia provinces are so greatly drawn upon in their passage through the rich and heavily cultivated upper part of the Delta as to be inadequate for the proper irrigation of the lower districts. The water-level becomes so low during summer, and the quantity of water so small, that only at great expense in the use of pumps and lifting machines can a small supply be obtained, and many of the extreme north tracts are left completely dry and barren.

The present work, says the *Scotsman*, will pond up the water considerably at a point on the Damietta Nile, halfway between Cairo and Mansousa. New heads will be made to the canals which feed those districts, so that the canals which were formerly the tailwork of the barrages system will then become main arteries. They will receive water at a much higher level than was possible formerly, and will remain full independently of the canals to the south of them. On the east the Mansouria canal and on the west the Sahel canal will thus take direct from the river in summer. At present the Mansouria canal takes water from the Nile in flood time, but is fed from the Rayah Tewfik, whose head is at the Cairo barrages, in winter and summer. The Sahel canal is at present purely a continuation of the upper Gharbia system, and has no inlet from the river near Zifta. A new head to this canal at the new barrage is among the details of the scheme.

The new barrage will have 50 openings each 5 metres wide, with at the western end a lock of 12 metres width for the passage of boats. This year all the foundations of the lock and a length of about 95 metres of the barrage foundations have been completed, and over this portion the work has been carried up to floor-level. The walls of the lock have also been carried up a short way.

The method of construction is similar to that pursued at Assiout. The foundations are outlined by a row of iron-sheet piles driven to a depth of about 4 metres below the lowest point reached by the concrete. Their tops project up into the concrete, which is then laid to a depth of about 0.90 metre. Upon this is built a mass of rubble masonry in cement mortar

JAMES CARTLAND & SON,

a little over 2 metres in depth. Every effort is made to build this masonry as irregularly and with as few straight joints as possible, and during construction it presents the appearance of a large and very jagged rockery. At the top the surface is brought up smooth with a concrete made with fine chips and finished off with cement floating.

The work was not given out as a contract, but is being done directly by the Public Works Department engineers, using contractors for the supply of labour and materials. Between 4,000 and 5,000 men have been constantly employed all summer. These comprise all kinds of natives, from the Soudanese concrete beater with his weird chanting as he works to the Cairene mason, who is but little darker than many Europeans. A few European foremen are employed, but their number is small.

On the fall of the flood work will be taken up on the east side of the river, where wells for the sumps of the pumps have already been sunk to avoid delay in starting the season's operations.

THE BUFFALO EXHIBITION.

THE architecture of the Buffalo Exposition while partaking in many ways of the general characteristics of its predecessors, is, says the *Architectural Review*, of especial interest in its points of departure from previous exposition schemes. For example, there is to be found in it larger variety of treatment, greater exuberance of general detail and more complicated disposition of masses than have been adopted before. These differences indicate on the one hand highly developed imagination, on the other a lack of the appreciation of the limitations which occur even in so varied a problem as the conception of an exposition.

The value of ensemble has been sacrificed to the delight of variety. Everything, of course, depends upon the point of view, the original inception; and in this case it is manifest that the paramount desire has been that of gaiety, of joyous abandon. Taking this for granted and acknowledging that such a desire is legitimate and expressive of the purpose of an exposition, there still exists the doubt whether the work is not keyed to too high a pitch, and whether the continuous persistence in variety has not produced a monotony from the very lack of contrasts. Minor contrasts are innumerable, but broad comparisons are absent.

The plan is one of peculiar beauty on paper; it is almost imperceptible upon the grounds from the reiterant interception

of minor details upon its axis. Upon the plan the relative sizes of masses are well adjusted; in reality these masses have materially changed their character and become at times discordant. That much of this has been caused by changes during the progress of the work is evident. It is the fate of many details of carefully conceived plans to "gang aft a-gley" because of the innate depravity of unforeseen conditions. For instance, the grand entrance to the grounds is but little used, and the majority of the visitors filter in through small allées, which fact is due to the change of terminus of the street transportation lines.

The bridge, with its four majestic pylons, finely detailed, is conceived upon so grandiose a scale that it becomes impossible for the remainder of the architecture to be kept in scale with it, and the water beneath it sinks into insignificance. The pylons dwarf the vista seen between them. Even the central tower seems small in comparison, and it is not until the bridge is passed that the dignity of this tower is felt. Here on the right and left are pergolas without terminal accents, and with a change in scale which is startling. They are charming in character, and lead respectively to the Government building on the right and the horticultural building on the left. At this point the impression of multiplicity of detail is very strong. Everywhere are statues, fountains, lamps and shelters; the sky silhouette is restless with pinnacles and towers and domes; wall surfaces are conspicuous by their absence; monumental entrances, colonnades, arcades and bizarre and peculiar window forms are in great profusion. The whole effect is nervous, often virile, always interesting, but bewildering. One seeks in vain for a focus, for some one thing masterful and dominant. The great tower, rising to a very beautiful termination, expresses the intention of concentrated interest and holds attention for a moment from the distracting appeal of its neighbours. At its base is a colonnaded exedra, which by its very nature should be a terminal unit, but through and beyond it appear still other colonnades and pavilions. The great fountain, a most delightfully exuberant piece of design, is not sufficiently isolated to command proper attention. The basins, so admirably planned, can be seen only at intervals, and the water, kept agitated by too numerous jets, has no reflective surface. Every space is too much peopled and is too busy, and the surface grades have not been effectively treated. The buildings are not raised sufficiently; the small bridges destroy vistas; there is a want of broad-stepped terraces. The sunken mall and the sunken garden have great charm from within.

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED.

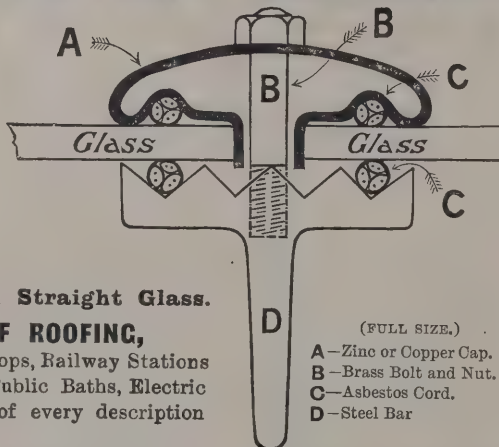

PERFECTLY DUSTPROOF.

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass.

SUITABLE FOR ALL KINDS OF ROOFING,

Such as Weaving Sheds, Engineering Workshops, Railway Stations Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description &c. &c.

This System allows for full expansion and contraction of glass and absorbs any vibration machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

147 STRAND, LONDON, W.C. (FIRST FLOOR.)

Behind the tower is the most interesting portion of the grounds. Here the sweep of the peristyle and the two restaurants on either end and the small pavilions have very great merit, and form the one large composition on the grounds. The beauty of these buildings, especially of the towers, is worthy of all praise. Individually the various buildings are of great interest and in their details often of great beauty. Especially fine are the great portals, the cornices and eaves—everywhere is unusually well-composed and decorative detail—and the picturesque bits under archways, through colonnades and pergolas, are delightful and numerous.

With all this exuberance of form the one thing which could have harmonised the exposition was the adoption of one tone of colour throughout. On the contrary, a colour scheme exists that is peculiarly mischievous. The idea apparently was to start with strong somewhat barbaric colour at one end and terminate with more sophisticated and moderate colour at the other, the intention being one of attractive and perhaps chronological gradation. As a theory there is a certain literary appeal in the scheme. It appears to have the value of sequence and of crescendo, and might possibly be successful in a series of connecting interiors; but as a fact, applied in the open to isolated buildings of varying character, and with totally different light and shade, it is foredoomed to failure and can be only productive of a harlequinade. And as if this were not enough, the entire surfaces of the different masses are treated in different tints, upon which the stronger colour is displayed. The natural result is, especially at the barbaric end, that strong mustard yellows, *foncé* blues and vivid reds come in close proximity with pale tints of fawn, green and greys without the possibility of the arbitrary adjustment of proportions necessitated by such juxtaposition in order to insure success. The choral hall is especially unfortunate. Where that most satisfactory of materials for architectural decoration, gold, is used, it is in too large isolated masses.

There are some very successful pieces of colour. The main tower is good—the cornices, soffits and friezes of the building in front of the tower on either side exceptionally good, and the entire colouring of the court behind the tower fine. One of the most interesting buildings in every respect on the grounds, in scale, design and detail—the Stadium—is without colour. On the whole, the colouring of the "Rainbow City" leaves the impression that a very varied scheme of colour confuses and belittles a large scheme of architectural correlation of building and that the conception of the colour should be as simple and

as universal as is the general scheme of the architectural ensemble. It is ensemble that Buffalo lacks. It has the marked element of great and able variety not sufficiently controlled, and of unusually piquant interest without the quality of breadth.

PUBLIC IMPROVEMENTS IN BIRMINGHAM.

CONSIDERABLE progress is being made with the various public improvements which have been undertaken by the public works committee of the Corporation on behalf of the citizens of Birmingham. The principal scheme, of course, says the *Birmingham Daily Post*, is the reconstruction of the sewers, a project which was commenced about two and a half years ago, and will occupy the attention of the authorities and the finance committee, who have charge of the public purse, for some few years to come ere it can be said to be within measurable distance of completion. The re sewerage of the city is a gigantic undertaking, involving an enormous expenditure from the rates, but considerations of health made it imperative that the work should be taken in hand without delay and carried out as expeditiously as circumstances would permit. At the outset, as we have explained on previous occasions, the city was divided into five districts, and operations were commenced in Edgbaston and Harborne, a district which, in respect to its sewerage, was the worst in Birmingham. In the reconstruction of the sewers in the locality, which embraces practically the whole of the Edgbaston Parliamentary division, it became necessary to lay down about 64 miles of new foul water pipes, and in addition many miles of storm water pipes. The total cost of this portion of the scheme was estimated at 155,000*l.* in round figures, and it was believed that the work would be finished in about four or five years. This estimate in regard to time and money, it is expected, will be well within the mark. Nearly two-thirds of the work has already been accomplished, and if the same progress is maintained another twelve months or so ought to see the beginning of the end so far as this particular district is concerned. The work has been carried on by the department in a most impartial manner. No portion of the district has been favoured at the expense of another, for culverting operations have been going on simultaneously in every part of the area. Some of the worst neighbourhoods have been finished, and at the present time the work is proceeding in Edgbaston Park Road, Hermitage Road, Westbourne Road, Norfolk Road, Harborne

Road, Calthorpe Road and some of the adjoining thoroughfares. A good deal of the work is in the hands of contractors, but by far the most important part of the scheme is being carried out departmentally. The weather is responsible for the progress made, but it is believed that the culverting in the roads named will be completed within the next two months, and then other thoroughfares will be closed to traffic. As soon as the district is resewered the next worst of the five districts will be taken in hand, and so the work will be continued until the whole of the city has been provided with new sewers, which it is anticipated will be sufficient for all practical requirements for about half a century.

Another important matter which is engaging the attention of the public works committee is the construction of the Rea main sewer at Saltley. It runs from Montague Street alongside the river Rea through the land of the Midland Railway Company and the Gas Department to beyond Nechells Recreation Ground, a 6-foot culvert being used between Montague Street and Saltley Viaduct, and a 7-foot culvert from that point to the terminus. This is a somewhat difficult and laborious undertaking, but the work has been in operation for more than twelve months, and if the weather is favourable the contract may be completed within the next six months. The Sewer Department is also very busy in other parts of the city not only in respect to the renewal of pipes, but in the inspection and superintendence of the sewerage in those districts where the building trade is especially active just now.

Street and road improvements are in progress on every side of the city. Those people who are acquainted with Pritchatt's Lane, which runs from Edgbaston Park Road to Somerset Road, well know what a narrow, awkward thoroughfare it is. It is an important link, which to all intents and purposes connects the Bristol Road with Harborne, and all who use it will rejoice to learn that it is now to be straightened and broadened and made something like what a public road should be. In the central parts of the city attention is turned to Summer Lane, where between Snow Hill and Hospital Street the macadam is being replaced by granite on a concrete foundation. The upper part of Broad Street has recently been relaid with wood, and the London and North-Western Railway are improving the bridge in Navigation Street which carries the thoroughfare over the railway from Hill Street to Pinfold Street. The wood floor on the top of the girders is in course of restoration, and when that is finished the road department of the Corporation will, at the

expense of the company, complete the work by laying down on a concrete foundation a new granite pavement.

Turning to the tramways, the chief matter on hand just now is the renewal of the cable line for a distance of about a mile and a quarter between Colmore Row and Hockley. This is a tedious undertaking, because it is impossible to disturb the metals in the daytime, and consequently the work can only be carried on for a few hours every night after the cars have ceased running. The work has been going on for several weeks, and it will be two or three months before the scheme is finished, but sufficient has already been accomplished to show that the repair of the line will be a blessing to the residents and shopkeepers along the route. When the joints between one rail and another are seriously worn and depressed there is a noisy jar as the cars pass along, and complaints have many times been made of the nuisance which is thereby occasioned. The same complaints are made on the Bristol Road route, but the cable district evidently is to be improved first. A good part of the line has already been relaid, and on that length the diminution in the noise is so conspicuous as to be the subject of general remark on the part of the passengers and also the residents in the neighbourhood. When that route is completed the Bristol Road line will no doubt be commenced. An important alteration is in progress in Hill Street. Two lines run from John Bright Street down Hill Street, but only one is necessary. The cars stop on turning into Hill Street to take up passengers, and it often happens that the prospective passengers so crowd the roadway that traffic is impeded. With the object of preventing an obstruction as far as possible the line from John Bright Street is being laid with a much wider sweep into Hill Street, and is being carried down by the station on the left-hand side, near the footpath. This will have the effect of compelling the passengers to take up a position on the footpath away from all danger arising at a point where the vehicular traffic has for a long time been seriously congested. It is impossible, however, to carry the line the whole of the way by the side of the footpath into Station Street, because the railway authorities would object to a narrow curve and metals closely laid to the goods entrance to the station, and so the workmen on arriving near St. Jude's schools will connect the new with the old line in the centre of the road. These operations are rendered somewhat difficult by the intricate character of the work, and as progress can only be made at night several weeks must necessarily elapse before the alteration is completed.

MAW & CO. LIMITED

BENTHALL WORKS, JACKFIELD, SHROPSHIRE.

The Architect.

THE WEEK.

THE First Commissioner of Works, when explaining the position of his Department in respect of the commission for the new offices in Westminster, created the belief that he possessed the drawings by the late Mr. BRYDON which were necessary for accomplishing the design. It would now appear the drawings are less complete than was imagined. Mr. BRYDON had been instructed to arrange for the execution of the works in sections. The first was the carcass of the building. The drawings which were prepared for that purpose could not be regarded as complete at the time of the architect's death. Any details were got out in a hurry and merely for the guidance of the quantity surveyor. The only conclusion which can be drawn is that the First Commissioner was not rightly informed about the character of the drawings, and the unfinished work of the architect which will have to be entrusted to other hands is of the last importance. The position of the First Commissioner in such circumstances is undoubtedly one of difficulty. To expect, as has been proposed, that an architect as able as was Mr. BRYDON should accept the fragments of designs and out of them produce a reality which will correspond with the unknown ideas of an artist who is no longer among us, is to suppose that a man will undergo great sacrifices in order to acquire reputation for another without a thought of his own interests. In the present case we have no DAMON and PYTHIAS to warrant confidence in heroic friendship, and, indeed, there is no record of the evidence of so self-sacrificing a pair of architects at any time. The conditions of architectural practice are not favourable to the production of so much amity. Nor is the First Commissioner likely to imagine that an unprecedented variety of unselfishness is at his disposal. It must now be plain to him that the least important part of the commission has alone been completed. We suppose the skeleton of the building must be accepted, for it has been arranged under official instructions. But as whatever will impart architectural character to the bare walls has yet to be designed, the most prudent course will be to allow to whatever architect is entrusted with so weighty a duty the credit as well as the responsibility for his own work. In that way only will the Office of Works be spared the trouble which will inevitably arise if a romantic notion is accepted of the relations between architects. The death of Mr. BRYDON is a misfortune, but he was not the only architect who was capable to design a simple Classic building. The manner of his selection was unwise, and the best course for the Government to take would be to follow the usual procedure, and to obtain designs for all that has to be done by means of a competition, which perhaps in this case had better be limited. On the other hand, the First Commissioner may have realised the whole extent of the work to be done, and the co-operation of Mr. BRYDON's chief assistant may be sufficient to enable the Office of Works to cope with all difficulties.

THE annual report of the Bristol and Gloucestershire Archaeological Society refers to the excellent work which has been carried out. The investigations which were commenced on the site of the Cistercian abbey of St. Mary, Hayles, in 1899 were continued in 1900, and the abbey church was carefully excavated under the superintendence of Mr. St. CLAIR BADDELEY and the general secretary. The excavations were temporarily suspended owing to the sale of the Toddington estate, but it is hoped they will be recommenced. The purchaser, Mr. H. ANDREWS, has assured the secretary and Mr. BADDELEY of his interest in the work, and has led them to believe that they would have his valuable assistance and sympathy. Lord SHERBORNE presented to the Society a calendar of deeds in his possession, and Mr. F. F. FOX the Little Red Book of Bristol, two handsome quarto volumes. The Council purchased "Dugdale's Extinct Barony" and several similar works, and have gladly adopted the suggestion of the Congress of Archaeological Societies that a list of the monu-

mental effigies in Bristol and Gloucestershire should be compiled under the direction of that Society. Mr. LATIMER, who ably represented the Society as secretary in Bristol for some years, has resigned his post, and the Council appointed Mr. J. E. PRITCHARD, F.S.A., in his room. Mr. PRITCHARD had already greatly strengthened the position of the Society at Bristol, having proposed fifty-five new members during the last nine months. The Council acknowledge the courtesy of the committee of the Clifton Antiquarian Club in permitting the Society to print several papers contributed to that Club simultaneously with the Transactions of that Society. The meeting of the Society was held this year at Chipping Camden, from which there were several excursions. One of the buildings seen was "The Priory," a former grange of Pershore Abbey, and at present the residence of Mr. F. D. MILLET, the artist. When the Society visited the building in 1884 it was in a deplorable state of dilapidation, but it has been greatly improved by Mr. MILLET, and is now used by him as a studio.

THE new series of *L'Art* seems to be conducted on the principle of rewarding purchasers at all costs. Lately we mentioned that a fine lithograph was presented after COROT by M. TH. CHAUVEL, the artistic director. With the latest number another plate is given, *Embouchure de la Toques*, after one of M. CHAUVEL's paintings. Similar prints are unknown in England, for high-class lithography is a lost art among us. There is also an original etching by M. PIERRE GUSMAN, who is a master of definiteness in detail. Various photographic illustrations embellish the pages. The literary contents as usual are from the pens of specialists. M. CHARLES NORMAND has brought to a conclusion his interesting biography of CHARDIN, the eighteenth-century painter, whose small pictures afford more interest to modern amateurs than those by many of his contemporaries. The painter was over-conscientious, and was not sufficiently expeditious to please his patrons. Before his works GREUZE was silent, and the best judges in the middle of the eighteenth century looked on his smallest work with amazement like that with which at a later time MEISSONIER's works were seen. M. GUIFFREY, the administrator at the Gobelins, writes on tapestry, and gives information of a kind which is not usually found in books on the subject. M. PAUL LEROI turns his long experience of artists and their works to account in his article on Marseilles, and in a criticism on the Salon. To say that the number upholds the standard of the new series is its truest eulogium.

WHILE many of the good people who believe their mission is to correct the faults of English manufacturers are lauding the advantages of the German system of technical education, and in that way aid our rivals, it is well to remember that authorities in Germany are not satisfied about the superiority of German teaching, especially when there is a test by means of results. That excellent magazine, *Dekorative Kunst*, in the last number, contains several illustrations of English textiles which were woven for furniture-makers. They are represented as being average specimens of English goods, and the writer does not hesitate to say that stuff no less handsome can be procured in Germany. But it becomes manifest, he says, at the first glance that the German patterns are borrowed, whilst the English have a character of their own. The English draughtsman, it is said, has been brought up to a belief in the virtues of self-help, which has no place in the German school system. The German, in art, as in other things, depends on State-help, and waits until it is forthcoming. The English patterns are described as clear and definite, and although the colouring may not be subtle it is decorative, sound and enduring. Moreover, there is peculiar technical skill shown in the combination of wool and silk in the pieces. While the Munich magazine gives us credit for superior industrial arrangements, in the next article it expresses a lament over the bungling of the competition for the QUEEN'S Memorial, which seems destined to end in a fiasco. What appears best in the project is, says the critic, the avenue from Buckingham Palace to Trafalgar Square, with groups of sculpture. This feature, it is thought, must have been suggested by the memorial avenue of the Hohenzollerns in the Tiergarten of Berlin.

FLOWERS AND DECORATION.*

WHETHER the laws of æsthetics approve or condemn the employment of flowers as subjects for ornament is of little account. So long as artists are found in the world there is no doubt they will continue to utilise leaves and blossoms. It may be illogical to represent forms which grow vertically as lying flat, as in floor or carpet decoration. For a like reason, the flowers most commonly seen on wall-papers are inconsistent with nature. We know, too, that the natural scale of flowers is not respected, and fidelity is not observed in the colours. Those who conventionalise flowers have, therefore, logic on their side. Their treatment ignores, however, the qualities which are accepted as most beautiful or interesting in vegetation. What is a still greater loss, the associations which belong to so many flowers could not arise at the sight of their geometrical diagrams, even in the mind of a mathematician. Representations of nature more or less accurate seem to be unavoidable. Indeed, it may be said that if ornamentists and poets were deprived of the liberty to employ "the stars that shine in earth's firmament" their arts would have to be revolutionised.

The question next arises, To what extent is accuracy in depicting or describing flowers essential? It is generally agreed that the poet need not take the place of a lecturer on botany in any of his references to flowers. It is preferred if he will simply suggest their characters, as if they bore some resemblance to human beings. All that is said about the modesty of the daisy, the purity of the lily, the obtrusiveness of the poppy, the forwardness of the violet and so on, are simply the application of qualities which are derived from men and women. SPENSER, whose vocabulary was most ample, did not hesitate in one sonnet to speak of the rose, the juniper, the eglantine, the firbloom, the cypress, the nut, the broom-flower and the moly as "sweet," and in repeating the adjective eight times, he showed good sense, for he expressed a characteristic that is applicable to most kinds of plants. In other cases he employed more special words, but a general appellative is often the most suitable designation. In the same way the flower, when employed as a *motif* in decoration, need not resemble an illustration in a book on vegetable physiology. GOETHE the poet, who was also a scientific botanist and dissected plants in his search for the original plant type from which all varieties were descended, once said that the influence of botanists on flower painters was most injurious. Artists were so concerned about counting the filaments and displaying the smallest details, the grouping, colouring, light and shade and other essentials were neglected. The same fault is still more marked in much of the flower decoration which is now produced. The artists seem to be eager to demonstrate that they have gained rewards for their knowledge of physiology, and details are introduced which are fatal to breadth of treatment. In the majority of cases we believe the people who buy pottery or textiles which are adorned with flowers are indifferent to the fidelity of the representations. What is most sought after is effect, and if that is gained there is no regret about the sacrifice of botanical truth. No sensible man or woman would go to wall-papers or the covering of furniture for instruction in science. In fact, if an artist were to invent plant forms which would be superlatively decorative he would gain more success than if he rigorously followed natural models which were created to serve other purposes than as patterns for ornamentists.

Racial characteristics count for much in art, and in spite of occasional lapses there is no doubt English folks seek after accuracy in all their work. Their sense of fitness also is opposed to incomplete things, and a plant form that would consist only of flower and stem would to some eyes appear an anomaly. Art, however, demands sacrifices, and as it is impossible to unite pictorial effect with the truth which botanists demand, the latter must give way. Nothing is easier than to observe in the works of great painters omissions and departures from reality when flowers and fruits are introduced, and they would have been amazed at any men of science who insisted that their treatment was defective. Sir GEORGE BIRDWOOD, for example,

used at one time to make an annual onslaught on new pictures because he perceived slight defects in the serration of a leaf or an excess of a petal in a flower. But he did not venture to assert a picture would be improved as a work of art or its pleasure-giving qualities enhanced if nature had been more scrupulously imitated.

It must be admitted that the artist is more likely to succeed in producing satisfactory results who is acquainted with the difference between a plant as an organised being and a decorative object which is inspired by the plant. There are certain characteristics of a plant which are more valuable than others to the artist, and by giving them prominence, as we have suggested, he resembles the poet. Who cares about the colour of daffodils when PERDITA speaks of the courage shown in their early arrival—

Daffodils,
That come before the swallow dares, and take
The winds of March with beauty—

or when MILTON invites "daffodillies" to fill their cups with tears? The flower by both writers is treated as subservient to the attainment of a particular end, and there is no lingering over any qualities possessed by it for the sake of rendering justice to its form or arrangement. The two poets loved flowers and studied their ways, but they never thought it was erroneous to make only partial references to them. MILTON evidently considered he was enhancing the importance of flowers when he endowed them with qualities derived from man's handiwork. Thus he speaks of "quaint enamelled eyes," "every flower that sad embroidery wears," "the soft downy bank damask'd with flowers," &c., expressions which suggest he was a creator and flowers were only materials for his use.

It is an exacting undertaking to treat flowers in a manner that would satisfy a botanist and at the same time to bring out their decorative qualities. This, however, has been satisfactorily accomplished in "Decorative Flower Studies." The work might be called a series of floral portraits; but it also furnishes us, unlike most portraiture, with analyses of the forty subjects. We might also say that the botanist or dissector of flowers appears on one page and the artist on the other, and the two classes of work are executed with equal competence. The representations or portraits of the flowers are drawn with a loving care to do justice to every variation of line, and also to suggest the fitness of the subject for decorative purposes. No attempt has been made to rival the books which have been published from time to time in which the colours of flowers have been expressed by means of machine printing. In the volume before us there is no attempt at gradation, and the colours cannot therefore be taken as competing with nature. It has been often affirmed that one of the causes for the scarcity of flower painters arises from the difficulty of representing colours with which people are well acquainted, and products which are adorned with coloured flowers are too often most absurd. It is therefore satisfactory to find in a book for the instruction of artists that the colours are manifestly no more than subdued suggestions of the originals, and in that way a lesson is given which should be utilised by manufacturers and others.

A first glance at the pages is sufficient to show that the drawings have been affected by the new modes over which battles are being waged. This is seen, to take one peculiarity, by the manner in which the stems of the flowers are treated. It would be easy to point to many examples of design in which flowers appear to be stemless, and sometimes that treatment may be judicious, but it does not suit with later ideas, and occasions arise when strength should be suggested by the introduction of stems, a course which will be fatal to many stereotyped arrangements. Several of the plates in the volume are distinguished by the marked character of the stems as much as by the blossom or the leaves. Among them we may mention the larkspur, columbine, love-in-a-mist, lavender, eschscholtzia, zinnia, pink poppy, fine-leaved heath, gorse, the thistle and others. In speaking of the plumbago, the author says:—

The chief characteristic of the plumbago, the real essential of its plant form, seems to be the upright character of its growth; each small shoot branching out of the main stem and rising vertically, though that main stem may have been induced

* *Decorative Flower Studies for the Use of Artists, Designers, Students and Others.* By J. Foord. London: B. T. Batsford.

by its own weight or other causes to take a different direction. So the first impression of the plant is of a series of upright lines, sufficiently influenced by the tremulous delicacy of the stems and the slight change in direction at the joints to give variety, without weakening the general effect of a very beautiful, natural, decorative scheme. And I feel sure that in making a decorative drawing or design from any plant, its natural growth and habits should be carefully studied, and never violated. And while strongly deprecating the idea of the untrained realist that nature alone is sufficient and can be taken raw, I believe that every earnest student of nature will find in her endless, beautiful *motifs*, and will so recognise their beauty and their fitness that they will feel at once "that is the way I must treat it." So to them it will be often more a question of selection and adaptation than of actual complete composition. And so many and so varied are the aspects in which nature reveals herself to different minds, that there need be no fear of monotony or repetition among those who study her and seek inspiration from her sincerely.

It is only necessary to compare the plate of the plum-bago in the volume with any engraving of the plant in earlier works on botany, in order to perceive how much more importance is attached to its verticality as a characteristic. In many other ways the book differs from its predecessors. The pink poppy, to take another example, has a pleasing blossom, which is suited for the designer's purposes. But what the author regards as the most useful parts are the "long graceful lines of its stems, the adaptable form of the leaves and its wonderfully decorative seed vessels." When speaking of the iris, which has been utilised since the early days of art, attention is drawn especially to the seed vessels, and they are said, "with their variety of curving form and the brilliant contrast of the orange berries with the silvery lining and dead green of the outer side, to offer fresh opportunities both of form and colour for workers in many branches of decorative and applied art."

It is also remarked of the common viper's bugloss that "the flower is of a very rich pure blue colour, with touches of purple on the stamens and buds, and with its sombre grey-green leaves forms a strikingly beautiful and unusual colour scheme." When describing the honeysuckle the author, while admitting it has been largely used, observes, "The beautifully simple form of the undulated leaves and the clusters of berries, seem to merit more attention than they have received." The shrub should always have interest for designers. It was one of the few forms which were honoured through being utilised by the old Greek artists. MILTON invites EUPHROSUNE

to come in spite of sorrow,
And at my window bid good-morrow,
Through the sweetbriar or the vine,
Or the twisted eglantine.

SHAKESPEARE also speaks of

the pleached bower,
Where honeysuckles, ripen'd by the sun,
Forbid the sun to enter, like favourites,
Made proud by princes, that advance their pride
Against the power that bred it.

When looking over the plates the question arises, Why certain varieties of plant forms which possess suitable qualities are not much used for ornament? The heath is one of them. It has been turned to account in France. Gorse is another, and the thistle receives far more attention from our neighbours than from Scotsmen, their wives and daughters. We are afraid the neglect originates in the commonness of the vegetation. In design as in other things financial value is of prevailing importance in England, and a piece of room paper or a textile which bore an ornament that could be described as derived from an orchid costing some hundreds of pounds could hardly fail to become a success. The enormous patterns which are seen on cheap papers and curtain stuffs owe much of their attraction to the belief which prevails among the humbler classes that very large plants are expensive and therefore beautiful. A visit to the Jardin des Plantes in Paris is enough to demonstrate to any impartial observer one of the differences between Frenchmen and Englishmen in their appreciation of ornament. Beds are to be seen containing plants which in England would be considered weeds and would not be tolerated in any art school or approved by any manufacturer. In Paris quality which merits to be utilised in design is alone taken into account, but in England judgment is determined by prejudices with which money is connected, it may be indirectly.

We are glad to see that in "Decorative Flower Studies" the French rather than the English system is adopted. It is announced in the preface that gardeners' specimens have been avoided, and what are irregularities and defects to the eyes of amateurs have been retained when they were characteristic of the flower. The words show a right spirit and the contents of the book bear them out. The plates should be inspiring not only in suggesting such ornament as can be derived from forty different prototypes, but in inducing students to seek out models from classes of vegetation which hitherto have been seldom utilised. The analyses of the subjects are sufficiently interesting to persuade students to apply the system generally, and, indeed, the use which can be made of "Decorative Flower Studies" is more various than the modest title and treatment would indicate.

CELTIC ART.

THE Celtic Congress which was held in Dublin last week does not appear to have produced any remarkable results. It is the misfortune of the race that, however shrewd they may be when dealing with everyday business, they become different beings in all matters which relate to their remote history. Then the Celt becomes compact of imagination, and ignores what on other occasions he would call common sense. In a multitude of counsellors there is supposed to be safety, and in Dublin Irishmen, Scotchmen, Welshmen and Bretons were to be seen and heard, but all the wisdom that was anticipated to arise seemed to have passed away to other regions. We do not deny that for a few hours unreality was able to exercise its sway over the Celtic mind, and may have produced some harmless pleasure.

The men and women who paraded the streets in fantastic dresses may have thought that they had attained the princely state to which their predecessors were accustomed at a time when every day brought its festival. But it is only necessary to turn to books with plates by Irish antiquaries and to works on costume in order to discover that in the days of old the dresses worn in Ireland were deficient in the picturesque. The allusions which are made to costume in the legends also confirm that belief, and considering the circumstances of the country, dress could not be otherwise than of the plainest kind. Scarlet, yellow and blue dyes were undoubtedly known and used, but the materials were coarse and the sartorial art displayed in fashioning them was of the humblest. The representations of the native Irish which were produced in the reign of ELIZABETH are testimonies that in a comparatively late period Ireland was not a land which was remarkable for finely-clad inhabitants. It was not, however, unique; the Scottish fashions in costume were not luxurious, nor the Welsh.

It is easy to conclude, when an occasional example of jewellery is discovered in Ireland, that similar ornaments were at one time common. Torques, collars of gold, chains, rings and the like are all supposed to have been plentiful. It is forgotten that such adornments were necessary to distinguish the chiefs, and were handed down from generation to generation. Nor, even if the goldsmith's work were more in use, is it safe to assume that the dress was in keeping with the ornaments. Gold was at one period, if the geologists are to be credited, occasionally found in small quantities without the trouble of digging for it, and was employed for the adornment of kings and princes or, more rarely, for ecclesiastical purposes. The illusion, however, still prevails, especially on occasions like last week's Congress, that the jewellery is only to be taken as a sign of the prosperity of the land in olden times and of the mineral wealth which then existed, part of which could be assigned to the production of rings, necklets and chains to be worn by many other people besides chiefs. MOORE'S song about the Irish maiden who wandered alone through Ireland wearing rich and rare gems and a bright gold ring on her wand is accepted as historical evidence of ancient riches.

All things taken into account, the jewellery is the most beautiful variety of Celtic art. The gold collar, which is among the treasures now in the possession of the British Museum, and which are demanded for the Dublin Museum by members of Parliament and others, is a delicate example

of engraving and repoussé work which would be worthy of any country in Europe. No less admirable are some examples in the collection of the Royal Irish Academy. In such manuscripts as the Book of Kells and the Book of Durrow we see art of a kindred style and no less praiseworthy; but, as JOHNSON says, when you have seen one green field you have seen all green fields, and the amateur who takes up the study of Celtic art would do well to confine himself to jewellery and illuminated manuscripts. There may be defects in both classes of work, and in neither can we see a form that recalls anything created, but faults are condoned out of respect for the skill and patience seen in the miniature creations.

When, however, we examine the carving on stone we see only a coarse imitation of what was admired in gold or on vellum. There are enough stone crosses to prove the extent of the capability of the ancient carvers. We need not speak of the figures of saints which are introduced on some crosses, for in a country like Ireland it is not fair to expect sculpture resembling what we find in some of the early French churches. Ornament is, however, more easily executed, and remembering all that was done by the metalworker and the scribe in Ireland, it was to be expected that more dexterity would be displayed in the ornamentation of stone. As regards stoneworking on a larger scale, the Celts in Ireland as in other countries were not remarkable for their architectural prowess. The round towers, like the brooches and the manuscripts, have thrown a glamour over Ireland, and have been taken to be survivals of a vanished architecture that was remarkable for its mystery and beauty. The average Irishman is incredulous when he is told of the conclusions of his countryman, GEORGE PETRIE. That able archæologist could not discover pre-Norman masonry in any part of Ireland in which mortar was used, and as the stones of the towers were set in mortar he inferred that they must have been raised subsequent to the Invasion. It has been likewise ascertained that builders from the West of England found profitable work in the erection of Irish churches and monasteries, and, owing to the absence of experience in quarrying among the natives, stone had to be imported from the same district.

With some Irishmen there may be a misgiving about the partial truth of the statements relating to the indebtedness of the Irish to the constructive skill of Englishmen. But they explain away all similar circumstances by saying that despotic laws prevailed, and in consequence strangers were enabled to execute work from which Irishmen, less capable, were debarred. There is the belief still that if Celtic art was in the twelfth and thirteenth centuries subdued by foreign Gothic, it was not exterminated, and it can still be invoked for the production of works which will equal in quality anything seen in the museums of Dublin or London. Faith in immortality is an endowment of the Celt, and he associates it with art. No one who is acquainted with Irish feeling was therefore surprised on learning that one of the issues of the Celtic Congress is to be an inquiry about the application of the forms which are characteristic of the metalwork, carving and illuminations to modern productions of different classes.

What we see in them and in all specimens of Celtic work is the specialty of interlaced ornament. It is also found in other varieties of early art. But it never was so generally used or brought to so much perfection as in examples which can be credited to Ireland. It does not appear to have originated there, for the inquiries which have been made of late years would show that the ornament, like the Celts themselves, had gone through a long process of emigration, and was known from the East to the West of Europe. The details are of a kind which might be thought to admit of endless repetitions. But when so skilled an ornamentist as the late Sir DIGBY WYATT first saw the Book of Kells in Dublin, he discerned almost at a glance that what seemed to be mechanical symmetry was not a minute repetition produced by one of the processes which at all times were familiar to artists; it was rather an original drawing of corresponding parts. If the Irish monks were acquainted with tracing and reversal they never employed that way of production, but throughout their drawing followed one general rule. Those who advocate the application of Celtic ornament to modern work evidently must be ignorant of the peculiarity we have

just mentioned. They see in the interlacing an opportunity for repetitions of an easy kind like those executed by monumental masons. Exact repetitions would not, however, express the original treatment. It might be more exact in straight and curved lines, but it would be wanting in a quality which the Celtic artists may have had sound reasons for adopting.

The execution of the convoluted forms cannot be otherwise than most expensive. It was on that account no doubt that Norman interlaced ornament is so imperfect, especially if compared with older examples, for the lines which so often merge in one another give the impression that the carvers never attempted to produce more than an imitation, which would deceive the uninitiated. The first question, therefore, that the zealots who contemplate the revival of Celtic art should ask themselves is, Are those who admire ornament likely to pay the price which would have to be charged if work in the Celtic manner were executed? The Celts whose labours are proposed for imitation were in many cases monks, and they laboured under happy conditions which cannot in our time be recognised by tradesmen. All illuminators loved to linger over their tasks, and Celtic work probably took more time to accomplish than later varieties. The same rule must have applied to other branches of industry. The trumpet-patterns, the dragons, serpents and other fanciful beings which grow out of the lines were tedious in amplification, and no better means could be devised to test the patience of any man endowed with energy. There is another query no less important, Is work of that class adapted to modern requirements? The ornament can never be carried out with expedition, and we all have to learn that the older the world grows there is less time available for elaboration of designs. But the most important question of all is, What gratification can the ancient ornament afford to the people of to-day, who would have to look upon it? In Celtic art there are no representations of things in the water, on the earth, or in the air. It is at the opposite pole to the Japanese variety. Nor can it be regarded as a conventionalising of any natural forms. It may, in some remote age, have had a meaning. Parallelism and concentricism were expressive to the Celts long anterior to the production of what is now designated Celtic ornament. Indeed, the circular treatment of the arms of Irish crosses seems to be only a developed application of symbols on pagan memorials. But the key to all the twistings and turnings has been lost, and people are never likely to find delight in gazing at puzzles for which there are no solutions. The ornament is out of keeping with our age, and it is therefore no bad symbol of the Celtic spirit whenever it refuses to assimilate itself with modernity.

AN ANCIENT JEWEL.

IN the address of the Bishop of Bristol on King Alfred which we lately published, his lordship referred to the jewel found at Athelney with the inscription that it was ordered by the king. It has been contended that the jewel is Byzantine, or it may be Indian in character.

It may not be generally known that about sixty years ago a jewel of similar character was discovered while excavating a sewer opposite Dowgate Hill, in Thames Street, at the depth of about 9 feet in a dark-coloured artificial stratum of earth, unaccompanied by any remains that could aid in throwing light on its history.

The ouche, or jewel, which became the property of Mr. C. Roach Smith, the archæologist, and is now, we believe, in the British Museum, is, according to his description, four inches and a half in circumference. It is composed of a circular compartment, one inch and a quarter in diameter, set with variegated enamel, representing a full-faced head and bust, the outlines of which, with a crown on the head and the drapery of a mantle and tunic, are formed of threads of gold effectively arranged so as to mark the features of the face and the folds of the drapery; this is enclosed in a border of rich gold filigree-work set at equal distances with four pearls.

The enamelwork is composed of a green and blue semi-transparent material of a vitreous character for the garments and a white opaque substance of the same nature for the face. The hair, indicated by a darker colour, is divided in two bands over the forehead. A crown with three globes surrounds the head, the fillets of which appear pendent on either side, with a

foliated termination. The bust is arrayed with the chlamys or mantle over a tunic gracefully attached to each shoulder. It exhibits distinct characters from the material used in the ordinary enamelled productions of the ninth to the sixteenth centuries, which are invariably opaque. It is almost transparent, possesses little hardness, has a fractured texture and presents the appearance of an imperfect crystallisation.

It would seem that a kind of box had first been prepared, and in it arranged the outlines or skeleton work of the figure, formed of thin plates of gold and constituting cells for the reception of the vitreous substance, which appears to have been poured in when in a semi-fluid state, and subsequently ground down to the required thickness. This was the opinion of Mr. Bridge, the goldsmith, but other authorities supposed the coloured material was introduced into the lodgments in a pulverised form, which melted on exposure to heat at a low temperature and assumed a vitreous appearance.

The fibula, ouche or brooch is an ornament of the remotest antiquity. Originating in the very earliest periods of civilisation as an indispensable adjunct to the dress, it has through thousands of years retained its place in the costume of all nations, varying from the simplest form and material to the most elaborate embellishments of the most precious gems and metal, according to the taste or luxury of the times. Towards the decline of the Roman Empire the passion for decorated dress gradually increased. From the fourth century the diadems of the emperors became more and more enriched with pearls and costly stones, the fibulae appear embossed and the paludamentum embroidered also with pearls and jewels. Later still we perceive on the coins of the Byzantine princes the diadems and robes profusely studded with these ornaments so as almost to conceal the objects they were intended to adorn.

It is curious to trace the analogy at certain epochs in works of art between the Byzantine school, France and England; but Eastern fashion seems to have had but little, if any, influence on the customs and habits of the Saxons, who retained a nationality of costume as well as of character, the superior elegance and classicity of which, as exemplified in the illuminated manuscripts, appears uncorrupted by intercourse with their eastern contemporaries. Although the gem found at Dowgate Hill recalls the style of Byzantine work, also of works of art preserved in France attributed to the eleventh and twelfth centuries, yet this similarity appears to extend only to general character; in details there is a marked difference.

The drawing, the arrangement of the dress and the simplicity of the crown, have altogether a purer and chaster stamp than the Byzantine works exhibit, while at the same time in the gold filigree there is a certain resemblance to the *entourages* of those beautifully ornamented gold Roman coins adapted for suspension round the neck.

The jewel of King Alfred in the Ashmolean Museum, Oxford, and a large convex brooch in the case of the Hamilton gems in the British Museum, are analogous specimens. The three are of precisely the same character and work, though differing in details. That in the Hamilton collection, which is the largest, being about 2½ inches in diameter, has filigree work of like character set with pearls, but no portrait or image, and the coloured glass is arranged in stars of four points, while that on the uppermost compartment somewhat resembles the *croix fleurie* of later times. This is believed to have been found in Scotland, but unfortunately nothing elucidating its history is on record.

The jewel of King Alfred, however, more closely resembles the Dowgate Hill brooch. There is the same mode of setting and the same simplicity of costume in the two figures, though the design on the unknown specimen is much superior. The fillets also which form the outlines of the subject are much finer. The transparency of the materials of the former is also greater, especially the green in the central compartment, which in appearance resembles glass. The filigree work of the two has a close affinity.

We are, therefore, justified in considering them of the same period, and if so, that period is ascertained by the Saxon inscription of + AELFRED MEC HEHT GEVVRCAN—"Alfred me ordered to be wrought."

If this jewel was a production of the foreign artificers mentioned by the historian Asser, who, under the personal superintendence of Alfred, executed works in silver and gold, the apparent mixture of Byzantine and Saxon work would be explained. Alfred had visited Rome, his father Ethelwulf also, who resided there twelve months. On his return this latter prince married a daughter of Charles the Bald of France. To this foreign intercourse may be referred the introduction in this country of a taste for Byzantine ornament. Artisans brought into England from Rome or Constantinople would, if they attempted a portrait, copy what was before them, and thus the costume of England and not of Rome or Byzantium would be attended to, while the general style of the work and the embellishments would be influenced by designs to which the artists had been accustomed and familiar.

ST. PAUL'S CATHEDRAL.

IN a letter to the *Times* Dr. G. Johnstone Stoney writes:—The important information given in your columns by Mr. Somers Clarke, the architect to the Dean and Chapter of St. Paul's, indicates that the foundations of the Cathedral were carried by Sir Christopher Wren through an upper layer, 15 feet or 16 feet thick, consisting of the debris of old London. In the lower part of this layer the foundations were spread out to enlarge their foothold on the next stratum underneath, which is a thin layer of "pot earth" varying from 4 feet to 6 feet in thickness. Underneath this comes a stratum some 16 feet or 18 feet thick of "sand (not at all solid) mixed with gravel stones, the lower part wet," and under the layer of sand and gravel lies the London clay.

It would appear from the facts as described by Mr. Clarke that the subsidence which has been going on more or less since the Cathedral was built is to be mainly attributed to the removal and rearrangement of material by water, and chiefly by the water travelling sideways through the lower part of the layer of sand and over the upper surface of the London clay. Water making its way along a layer of sand or gravel resting on clay acts in three ways. Such water is always charged with carbonic acid (and in this case probably with other solvent agencies), whereby parts of the constituents of the grains of sand and pebbles that it meets with are dissolved. Even pure water is able slowly to dissolve silicates. These chemical actions are what make the water where it oozes from such a stratum more or less hard. The percolating water is also constantly engaged in rearranging, however slowly, the pebbles and grains of sand between which it makes its way, and it slightly washes away the surface of any clay over which it travels. Observations upon the large effects which may be produced by these agencies in a moderate number of years are described in a paper of which an abstract is given in the "British Association Report for 1870," at p. 86 of the "Transactions of the Sections." It is evident, too, that the subsidence to which these events give rise is likely to be more in some places than in others, thus doing all the more mischief, since the water will prefer some special paths in making its way from the place where it enters the sand under the Cathedral to the place where it emerges.

It is evident, then, that if we can prevent any water from having access to the layer of sand, the chief cause of the subsidence which has been going on will be removed. The layer of pot earth which lies over the sand, being thin, is probably not in all parts impervious to water, and surface water may reach the layer of sand through it. But the greater part of the supply probably comes from the slow horizontal travelling of water which always takes place in a nearly horizontal porous stratum which has clay or other impervious material under it. The direction in which this subterranean water travels in that part of London is probably known, and at all events can be ascertained. It probably is from the north and east towards the south and west. If so, it would probably not be impossible to intercept the inflowing water, and carry it round instead of under the Cathedral by a deep-seated sewer to the north and east of the Cathedral, and also to guard the layer of sand under the Cathedral from surface water percolating downwards. If all water can be kept from

having access to the part of the porous stratum which is under and near the Cathedral, we may reasonably expect that further change in this layer will be prevented, and that the subsidence of the Cathedral, so far as it is caused by this, which is probably the chief cause of the subsidence, will be arrested. It is evident, too, that deep-seated excavations like those of the District Railway and Central London Railway, may, so far as their influence on the flow of water is concerned, have either a useful or a prejudicial effect—useful if they tend to intercept water which would otherwise ooze into the sand under the Cathedral, prejudicial if they lie on the other side of the Cathedral and drain away water from the layer of sand, thus increasing the flow of water through it.

The present letter does not take account of another possible cause of subsidence, viz. the squeezing out laterally of the London clay when tunnels at some distance from the Cathedral are made through it. The effect produced in this way is probably of trifling amount, and, moreover, sufficiently uniform to lead to a tolerably equable subsidence of the whole building. A subsidence of this kind does little harm.

AN OAK CABINET.

IN the lecture-room of the Royal Academy this year, among other works of sculpture was the "Upper Front of a Cabinet in Oak," by Mr. Mark Rogers, jun., of which we give a small illustration. "The Wheel of Fortune" is the subject used in the centre panel of the door of this cabinet, other

detail being also derived from the same source. When completed the work will have been carried through on uncommercial principles, the sculptor being responsible for the whole design, and one cabinetmaker for the making.

A Freehold Site of about half an acre in extent, with a frontage of 200 feet to City Road and Old Street, has been purchased, at a cost of 36,400*l.*, for the London Leysian Mission. The suite of buildings will comprise two mission halls to seat a thousand persons, with classrooms, club-rooms, drill-hall, gymnasium, dispensary, coffee-palace, restaurant, &c., and is estimated to cost 50,000*l.*

The Bill introduced last session by the Corporation of London for the widening of London Bridge having received the Royal Assent, the necessary plans and working drawings are being prepared in the office of Mr. Andrew Murray, the City surveyor, and the work will probably be commenced next year.

STAINED GLASS IN ENGLAND SINCE THE GOTHIC REVIVAL.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays among French Cathedrals," &c.

A BRIEF REVIEW OF ECCLESIOLOGICAL PROGRESS, 1855 TO 1875.

(Continued from page 123.)

DURING the two decades of the Revival now under consideration not a few architectural works appeared which will, it is to be hoped, long remain classics on our shelves; indeed, the whole period was so fertile in the production of ecclesiological literature that this somewhat lengthy digression from our subject may not inappropriately close with an enumeration of a few of its more important and interesting specimens.

Arranged for convenience sake alphabetically, they are as follows:—Burgess' "Architectural Drawings"; Carter's "King's College Chapel, Cambridge"; Colling's "English Mediæval Foliage"; Eastlake's "History of the Gothic Revival"; a volume of "Essays on Cathedrals," edited by Dean Howson (1872), and comprising not only divers subjects relative to the organisation of capitular bodies, but an admirable and instructive chapter by the late Precentor Venables on the Architecture of the Cathedral Churches of England, considered Historically; Ferrey's "Recollections of Augustus Welby Pugin"; Fergusson's "Handbook of Mediæval Architecture"; Freeman's "Cathedral Church of Wells"; George's "Etchings on the Loire"; Beresford Hope's "Cathedral of the Nineteenth Century"; "The History of Our Lord in Art," begun by Mrs. Jameson, and on her death continued and completed by Lady Eastlake; Johnson's "Specimens of Early French Architecture"; Longman's "Three Cathedrals of St. Paul in London"; a translation of Lübke's "Ecclesiastical Art in Germany during the Middle Ages," by Wheatley; * Micklethwaite's "Modern Parish Churches" (this sound, sensible book originally appeared (1871-72) in the *Sacristy*, a short-lived but valuable periodical which to some extent took up the work of the *Ecclesiologist*); Murray's "Handbooks to the English Cathedrals" (not quite up to the mark perhaps in some respects, but happily free from that indiscriminate kind of eulogy which was and still is too frequently the besetting sin of such publications); Nesfield's "Specimens chiefly Selected from the Twelfth and Thirteenth Centuries in France and Italy"; Neale's (John Mason) "Dalmatian Notes"; Noakes' "History of Worcester Cathedral"; Sharpe's "Architecture of the Cistercians"; Seddon's "Rambles in the Rhine Provinces"; Street's "Brick and Marble of North Italy," and "Gothic Architecture in Spain"; Texier and Pullan's "Byzantine Architecture"; Severn Walker's "Architectural Sketches in Worcestershire"; and a republication of Winston's various works on "Stained Glass" in a collected form.

To these must be added the *Ecclesiologist*, started in 1841 by the Cambridge Camden Society, and which perhaps reached the full tide of its usefulness and popularity between 1850 and 1865. Unfortunately the *Ecclesiologist* came to an end in 1868, and nothing permanent took its place.† Two

* This is a somewhat disappointing book, especially as regards the illustrations. The section devoted to church furniture is particularly *jeune* in this respect, reproducing as it does so many of Viollet-le-Duc's illustrations of French Mediæval ecclesiastical ornaments. Surely Germany is rich enough in such relics that the author need not have laid those from France under contribution. Thus the rood-loft in the Madeleine at Troyes is given in lieu of such interesting Romanesque and First Pointed ones as exist in the churches of Naumburg and Gelnhausen, and of such exquisite Middle Pointed examples as the screens at Marburg, Halberstadt and Oberwesel; and why should a Spanish doorway from St. Jago de Compostella have been given instead of the rich and imposing Golden Portal from Bamberg or the south doorways of Neuss and Paderborn? The translation, too, in certain portions, is weak; indeed, a re-edition of the whole is well worth someone's undertaking. It is much to be regretted that no translation of the same author's work on the architecture of Westphalia has ever appeared.

† Many of the articles which graced the *Ecclesiologist* during the quarter of a century during which it ran its course are so valuable that their republication and collection into a couple of volumes would form a welcome addition to the shelves not only of the professional architect, but of the amateur and dilettante.

useful little contemporaries deserve mention—the *Penny Post* (edited and published by the Parkers) and the *Church Builder*, the organ of the Incorporated Church Building Society. The former, but lately discontinued, was intended primarily to supply reading of a good, wholesome High Church tone—it could never be called ultra-Ritualistic, though latterly it became more “advanced”—for the humbler classes. It almost invariably contained an article upon some architectural subject, the auxiliary arts not being forgotten, while its “Editor’s Box”—which, to those possessing a set of these little volumes, constitutes quite a library of valuable information—had no small share in contributing towards the growing interest in matters ecclesiastical. This interest the publication, in 1863, of the *Church Times* considerably augmented. The *Church Builder* was, perhaps, more devoted to statistical matters in connection with the movement, but its pages were frequently enriched with an ably-written article or series of papers by an architect of eminence, as, for example, “Brickwork of the Middle Ages,” from the pen of Mr. G. E. Street. Humble as such publications may seem, they form links in the chain of the history of the Gothic Revival, and on this account deserve a passing notice.

From the close association of its compilers with the eccle-

To Rev. Thos. Helmore—Priest in Ordinary at and Master of the Children of the Chapel Royal—was entrusted the musical editorship of “The Hymnal Noted,” valuable assistance being rendered by Rev. S. S. Greatheed (vicar of Corringham, near Stanford-le-Hope), Chas. Child Spencer (organist of St. James’s, Lower Clapton), and Edward Cruse (for some time organist of St. Barnabas, Pimlico, and latterly of Christ Church, Clapham).

Rev. H. L. (afterwards Bishop) Jenner gave his cordial co-operation; to Sir Henry Bishop we are indebted for the lovely harmonies to the melody of “Alla Trinita Beata,” set to the hymn “Blessed Feasts of Blessed Martyrs”; while the late Sir Arthur Sullivan, then (1856) a Chapel Royal boy, was entrusted with the harmonies to some three or four melodies, including those of the “Magnæ Deus potentia” (the hymn for Thursday evening) and the “Jam Christus astra ascenderat,” for Whitsuntide.

Arranged on a similar plan, but with many of the old Latin hymns recast and wedded to melodies of a more congregational character, there appeared in 1861 “Hymns Ancient and Modern,” under the musical editorship of the late Dr. W. H. Monk, whose accompaniment of the Plain Song to the Psalms at St. Matthias, Stoke Newington, where he was for thirty-seven

42. **Tibi Christe Splendor Patris.**

Evening Hymn for the Festival of St. Michael and all Angels. From the SALISBURY HYMNAL.

Rev. M. F.—There was war in heaven: Michael and his angels fought against the dragon; and the dragon fought and his angels, and prevailed not; neither was their place found any more in heaven.

THE O Christ, the Father's Splendour, Life and virtue of the heart,
In the presence of the An-gels Sing we now with tuneful art:
Meet-ly in al-ternate chorus Bearing our re-spon-sive part.
2. Thus we praise with veneration All the armies of the sky;
Chiefly him, the war-rior Primæ Of Coe-lestial chivalry:
Michael, who in princely virtue, Cast A-bad-don from on high:
3. By whose watchful cares repelling, King of e-ver-lasting grace!
Every ghostly ad-ver-sary, All things e-vil, all things base;
Grant us of Thine only goodness In Thy Pa-ra-dise a place.
4. Laud and honour to the Father, Laud and honour to the Son;
Laud and honour to the Spi-rit, E-ver Throned, and E-ver One:
Con-sub-stan-tial, Co-eternal, While un-end-ing ages run. Amen.

A PAGE OF “THE HYMNAL NOTED”

(From an Illuminated Copy in possession of the Author).

siological movement the above list would be incomplete without some mention of “The Hymnal Noted.” It originated during the later forties with several members of the Cambridge Camden Society, who, dissatisfied with the then existing collections of Church song, were desirous of producing one that should be arranged upon strict ecclesiastical principles. The aim of its promoters was an excellent and well-timed one, but unfortunately the opposite extreme was run into, for the book, although it must ever stand a noble monument of erudition, viewed both from a literary and musical stand-point, proved too severely archaic for the popular taste, the hymns being, without exception, translations from the Latin, while the greater portion of the melodies to which they were set were drawn from the ancient office books of Salisbury and York, and others existing in capitular and monastic churches, libraries and so forth on the Continent.

The task of translating the majority of the hymns was assigned to that accomplished liturgical scholar, Rev. John Mason Neale. Aid was also rendered by Neale’s coadjutor in the formation of the Ecclesiological Society, Rev. Benjamin Webb, while from the pen of Dr. Irons, then vicar of Brompton, are the “Dies Iræ” and the “Cælestis Urbs Jerusalem,” the latter having been specially translated for and sung for the first time at the consecration of St. Barnabas, Pimlico, in June 1850.

years organist, folks came from far and wide to hear. The publication of “Hymns Ancient and Modern” marks an epoch in the catholic movement.

Probably no collection of its kind—and it has had countless imitators—has at various times been so severely criticised. This, however, it has long since outlived, and if the test of a book is its popularity, then its promoters have had every reason to be satisfied with the result of their labours, for they rendered familiar hymns teaching sound doctrine, besides bringing before English Church people the devotional melodies of their Catholic forefathers, and all without being too “advanced” for adoption in the majority of the cathedrals and churches throughout the land.

Besides embodying not a few of those grand old melodies of the Western Church with which the promoters of “The Hymnal Noted” had striven to render Church folk familiar, “Hymns Ancient and Modern” rendered popular certain tunes from old English, French and German sources, also bringing forward tunes by modern English composers of sterling merit. Indeed, to mention but a tithe of the names, it is not too much to say that those by Rev. J. B. Dykes, Sir John Stainer, Sir Frederick Ouseley, Sir Joseph Barnby, Henry Smart, Arthur Henry Brown, and the musical editor himself, have done more to stimulate an interest in church-going and to promote true ecclesiastical feeling than many a sermon.

NOTES AND COMMENTS.

THE work of the French archæologists at Delphi is almost complete. The latest operations were connected with the clearing of the running path for a distance of 580 feet by 90 feet. The Greeks adopted a very simple arrangement in order to insure a fair start for all the athletes. Along the line which marked the beginning of the course spaces were cut in the rocky ground for their feet, and the competitors were compelled to stand in them until the signal was given. Eighteen pairs of hollows for feet have been traced. Care was taken to prevent the use of wine as a stimulant by any of the runners. According to an inscription found among the ruins, any person who introduced wine was obliged to make a sin-offering of five drachmas to the god who presided over the course, the stadium between the structures at the two extremities being considered as forming a holy place which all were to respect. That running men should have a special deity at Delphi will excite surprise. But as the athletic games were held to be sacred there was reason for a belief in a divine ruler of them.

ALL who are acquainted with the history of the Geological Survey in this country will remember that it had at first to overcome a general prejudice, for its utility was not recognised. It was therefore necessary to explain that the money wasted on fruitless searches for coal, which could have been saved if sections of the strata existed, would more than pay for all the expenses of the Survey and provide means for the establishment of a geological museum. Up to the present time money for the Survey has been grudgingly voted. How differently the Germans act is shown by the production of the geological Survey of Saxony. It consists of 123 sheets, and reveals to all the particulars relating to the character of the land which geologists have ascertained. The cost of each sheet varies from 1,500*l.* to 2,000*l.*, and the whole series is estimated to have required an outlay of at least 200,000*l.* The expenditure is, however, considered as insignificant when compared with the information which can be derived by engineers, miners, agriculturists, contractors and others from a study of the plans.

THE report of the Public Health (Sanitary) Department of the Corporation of London shows how assiduous in their watchfulness are those who have accepted responsibility for the sanitary condition of the City. In proportion to the greatness of London are the enemies to the health of the inhabitants. It almost seems incredible, for example, that one ton in every 427 tons of meat received at Smithfield was condemned, and that the total seizures in a year amounted to 961 tons, which was, however, about 200 tons less than in the preceding year. In addition, 769 tons of fish were seized as unsound; 312 cartloads of rotten food of other kinds had also to be removed, including 90,000 tins of fruit, milk, game, &c. A large quantity of unwholesome fruit sent to this country to make jam was also destroyed. There are many other enemies. Last year it was necessary to take precautions against plague. Disinfection had also to be gone through, and shelters provided for people who had to abandon their residences. At Golden Lane 55,000 gallons of disinfectants were manufactured and nearly all was applied. The spirit shown by the Corporation can be tested by the use made of their property. The artisans' dwellings in Houndsditch cost 202,242*l.*, and an expenditure of 1,850*l.* a year is required for their maintenance, but the returns are only 183 per cent. on the capital outlay. In the course of the year 9,220 sanitary inspections were made. In flushing the more thickly populated and poor parts of the City during the hot months the enormous quantity used was 38,111,835 gallons of water, together with many thousand gallons of disinfectants. In the neighbourhood of Billingsgate flushing is frequent, and deodorants are used at least twice in twenty-four hours. Despite all the care taken the mean death-rate was 22.1 per 1,000, while in the infirmaries and workhouses it rose to 27.9. This increase is explained by the remarkable fact that the inmates of those institutions are in the proportion of 1 to every 25 citizens, a remarkable accompaniment of prosperity.

THE markets for building materials have not of late been steady, and when calculations are made for a tender a builder often discovers that a sudden variation in prices will affect many of the items. But time may press, and the alterations being made in a hurry are likely to be erroneous. In that way the notifications of errors in tenders, which are now more common than formerly, are often to be explained. But owing to the frequency with which contractors endeavour to escape the contingencies which may follow from an error public authorities are becoming sceptical. Last week the Merthyr Urban District Council received a letter from a builder whose tender had been accepted for the erection of 100 workmen's dwellings, declaring he had made mistakes in his figures, and that the work could not be carried out for the sum mentioned. But the Board looked on the application as evidence of a general desire among builders to obtain higher prices, and resolved that steps should be taken to compel the contractor to discharge his obligation to perform the work for the sum he had mentioned, and regardless of its insufficiency. There would be fewer builders' names in bankruptcy lists if more care were taken in pricing and calculating for tenders.

THE description of the works of DORMAN, LONG & CO., LTD., and BELL BROTHERS, LTD., of Middlesbrough, which is the subject of a small volume, enables us to realise what is required if the steel industry is to be preserved in England. Their works can be compared to a fleet of the latest forms of armoured vessels, and they inspire confidence that while they are in the van there is no likelihood of any succumbing to foreign rivals. The business of DORMAN, LONG & CO. dates from 1876, and therefore represents a period of revolution in the manufacture of steel. Besides the production of steel rails, joists and angles, sheets and wire are now manufactured of many descriptions. By the union of the firm of BELL BROTHERS (Sir LOWTHIAN BELL) rivetted girders of the largest sizes can now be executed. Columns and stanchions are also made up. Every part of the works is on a grand scale. One drawing office measures 120 feet by 32 feet, and generally thirty draughtsmen are engaged. The girder-riveting shops are 500 feet in length, and have two spans of 60 feet and one of 70 feet. During last year nearly 30,000 tons of structural steelwork were made at the Britannia Works. In the three combined works of the company about 3,000 men are employed, and 3,500 tons of finished material are the weekly output. In spite of the continuous demand a stock of 6,000 tons of girders, channels and flats is kept at the Middlesbrough Works in order to meet all urgent orders. The resources of the firm are almost inexhaustible, and in consequence contracts for gigantic works are undertaken. Among them are those of the WESTINGHOUSE CO. at Manchester, in which 14,000 tons of steel will be used; the BRITISH THOMSON-HOUSTON CO., Rugby; VICKERS, SONS & MAXIM, Sheffield, &c. For the benefit of London contractors, stock yards, rivetting and drilling shops are open at Nine Elms Lane. Messrs. DORMAN, LONG & CO. have also an office at 19 Victoria Street, Westminster.

BOARD SCHOOLS, PORTLAND ROAD, HOVE, BRIGHTON, FOR THE HOVE BOROUGH SCHOOL BOARD.

UPLANDS, BRIGHTON.

THIS house, the residence of Mr. HORACE VOULES (well known from his association with *Truth* and Mr. HENRY LABOUCHERE, M.P.), stands upon high ground overlooking Brighton and Hove, and just on the outskirts of both towns. Our illustration sufficiently indicates the style of the building and the materials used, the house, together with the lodges, stabling and farm-buildings having been built from the designs of Messrs. CLAYTON & BLACK, architects, of Brighton.

SALISBURY HOUSE, FINSBURY, E.C.

CHICHESTER CATHEDRAL.

AS we are now publishing illustrations of Chichester Cathedral, the following lecture "On the Causes of Sublimity and Beauty in Cathedral Architecture," apropos of the building, have interest. It was delivered in Chichester by the Rev. Philip Freeman, M.A., several years ago.

The study of church architecture may be approached from so many sides and possesses such varied sources of attraction, that we cannot wonder that persons of the greatest possible variety of tastes and temperaments should be found at the present day to take a more or less lively interest in it. The wonder rather is that any age should be found indifferent to a subject which appeals in so many ways alike to our highest faculties and aspirations and to our most ordinary moods and everyday habits of thought. It should seem as if no one in whom there lingers any feeling of association with the past—of delight in what is beautiful, of awe at what is lofty and sublime, or of reverence for that which enshrines and shadows forth holy things—could really be indifferent to the charms of church architecture. In a word, we are all of us by nature, or, however, by Christian education, lovers of it. It may therefore fairly be presumed that to call attention to any part of this wide subject is to open a book which all must read with delight, or rejoice in hearing read by others.

In selecting cathedral architecture, with especial reference to our own cathedral, for the subject of some very unpretending remarks, I am actuated, not merely by the circumstance of its being the peculiar phase of church architecture which is more especially and constantly before us in this place, but by the following consideration more especially, viz. that, if I mistake not, church architecture, by its very nature, is best studied in the larger and grander specimens of it. It might seem, perhaps, at first sight that for those whose lot will as a general rule be cast among the humbler, however beautiful, parochial structures of the land, the subject were best studied in specimens of that simple kind. But if we consider, on the other hand, what it is that church architecture should strive to be and to express, we shall perhaps be induced to correct this judgment. The proper business, then, or the highest aim, certainly, of church architecture being to give utterance and expression by means of a material fabric (so far as this is possible) to the highest and sublimest emotions we are capable of—viz. to religious and devotional feelings and ideas—we feel at once that greatness, where it may be had, is an element which such architecture cannot well do without. Altitude, length, distance, space, are the elements we crave for putting together something which shall speak for us what we feel. Our sense of the greatness and glory of Him whom we worship and of the height to which even our limited faculties are capable of soaring in search of Him, is in a manner relieved by being allowed to utter itself, as it were, in things vast and high; in aisles that stretch away from, or vaults that soar above us. What a swelling and soaring anthem is to the heart and voice, that a cathedral is to the aspirations of the heart and the eye. And the religious expression of humbler structures is due, I conceive, in a great measure to this; that, on their smaller scale, they reproduce and recall, by similarity of features, those impressions of sublimity and grandeur which can only be tasted in perfection in fabrics of imposing dimensions. Hence it is well that the pastor of the village church, boasting its tower and spire, perhaps its arched aisles, its receding perspective of roof, but with no pretensions to grandeur, should enter once in awhile the cathedral church of his diocese, to draw from it an elevated sense of what church architecture aims to be, and is, when scope is given to it. He will return to his miniature copy of the vaster pile, not so much with a sense of lack as with the feeling that he has around him in the scene of his own ministrations, germs, however undeveloped—elements, however crude—of all that man has to give of architectural utterance to the glory of Him Who is worshipped there.

In turning, then, to cathedral architecture, and especially to our own cathedral, we are studying architectural art not merely in its highest, but in some sense in its only true and perfectly realised form, and in its best form for purposes of study. As children learn to read and write correctly in a large character, so must learners in religious architectural expression have recourse to the greater, that they may learn to appreciate smaller specimens of the art.

Bearing these considerations in view, I shall draw attention to the features of cathedral architecture in the full confidence that our study of it will furnish us with the true key for unlocking the treasures, and will best train our age for estimating the beauties of all church architecture whatsoever.

Let me point out, then, some of the leading characteristics of cathedral or collegiate, as distinguished from ordinary or parochial, church architecture.

Grandeur, both of altitude and of ground-plan dimension, may indeed be found to a great extent in parochial churches, but as a general rule the cathedral church of a diocese takes the precedence of its daughter churches in these respects.

Even in this diocese, comparatively small as our cathedral is, there are few churches, indeed, which are half its length, and not one which is half its height. Its extreme length is 410 feet; the height of its spire 279 feet. Even its transverse dimension, *i.e.* its width across the transepts, exceeds the length of every church, except some few, in the diocese. Next I would observe that this grandeur manifests itself, after all, not so much in magnifying as in multiplying features. In a cathedral there are, interiorly, three storeys or tiers, instead of one or two, as in parish churches. To the arches of the aisles is superadded not merely, as in many parish churches, a clerestory but an intervening triforium, the triforium being that space above the aisle arches which results from the slope of the aisle roofs, and which is always in large churches laid open by arches. The name is derived by Professor Willis from "thoro'" or "thro'-farium," a Latinised Saxon word, signifying, properly, any gallery running along in the thickness of a wall. This threefold piling of tier upon tier of arches, each tier perhaps a church in itself, or fitted by its dimensions to be so, may not unfitly be reckoned one of the sublimest efforts of Christian architecture, recalling the less religious effort of Virgil's Titans:—

Ter sunt conati imponere Pelio O s m,
Scilicet, atque Osse frondosum involvere Olympum.

Here then sublimity results from the multiplication of the stages or elements of height.

The arches of the lantern, or central part, are, however, in all cases of necessity, vast in themselves. Here the multiplication which prevails elsewhere throughout the building is exchanged for the magnifying of a single feature; and it will be found that the four arches of which I speak are among the sublimest interior features of Christian architecture.

First of all, these four arches exhibit and bring out by their span whatever nobleness in respect of width is possessed by the four arms of the cruciform structure. And next, it is here, and here only, that the sheer height of the interior is exhibited in one precipitous fall from roof to floor. Elsewhere, the multiplication of arches and tiers, introduced for wise reasons, while it dazzles and astonishes by producing a sense of number and complexity—the grand arcade being thrice repeated in its every feature—necessarily reduces to the eye the appearance of direct height. While in the one case the height is scaled, as it were, by successive steps, in the other the clear downward sweep as of a sword (to borrow a picturesque expression from Mr. Ruskin) challenges the eye to mount by a single effort to the entire altitude. The contrast is pleasing, and doubtless serves greatly to enhance, by unexpectedness, the impression of sublimity. The prevailing rule of the interior structure is, however, subdivision, and rightly. There is no greater mistake than to suppose that a large interior is more sublime from not being broken into parts. Were the whole of our cathedral, as some might perhaps imagine would be best for effect, one lofty sweep of wall from floor to roof; were it, in other words, but of one stage throughout instead of three, it would immediately lose fully half its apparent size and elevation.

A remarkable instance of this is presented by York Minster, one of the largest and—with the single exception of Westminster—the loftiest interior in the kingdom. Notwithstanding this nothing is more disappointing than the interior view. The impression it gives, the nave especially, is that of a large parish church; the cathedral idea seems to have been wanting. And why? Because, instead of three storeys, there are—at least, in effect—but two. The triforium is so treated as to be a mere elongation, downwards, of the clerestory. The great law of the multiplication of parts as a means of giving the impression of greatness is, in this instance, violated. And, again, we have seen that much grandeur is the result of a proper contrast between the complexity of the storeyed nave and choir and the single grandeur of the lantern arch. This contrast at York is in a great measure wanting. In vain these arches soar to the great height of 100 feet; the contrast, which would render this unbroken precipice of stone astonishing, has been in a great degree marred by the faulty construction of the rest of the building. In Westminster, on the contrary, the contrast is perfect, and the effect sublime beyond description.

On the multiplication of longitudinal features as a necessary element of beauty and sublimity there is less need to dwell. Poets in all ages have been alive to the glories of "the long drawn aisle and fretted vault;" of the succession of "antique pillars, massy proof," of arch behind arch "in endless perspective." An eloquent prose writer (Hugh James Rose) speaks of "nave and aisle revealing their awful perspective to the astonished gaze;" our own great Church poet of the "far-shadowing awful nave," and the like expressions. Now all this effect, never attained in any other kind of architecture, is due mainly to that apparently interminable repetition and multiplication of similar parts which makes up the vista of a cathedral nave or aisle. And—to exemplify in a particular what has been before observed in a general way—even in the

case of parish churches where these "long-drawn" effects are precluded by the scale of the building, we nevertheless learn to love and appreciate such approximations to it as a few pillars or arches can make, as seeing in them the germ of the more perfect specimens. Extension by repetition is the law of the humbler no less than of the more noble structure; the ideal the same, though the realisation is less perfect. This is more especially the case when, as in so many instances, the cathedral has communicated some of her features to her daughter churches. Thus in this diocese the dark Purbeck or Petworth shafts which are so characteristic of the cathedral reappear in the noble conventual fragment of Boxgrove, in several others along the coast from Shoreham to Havant, and in this neighbourhood at Bosham, Appledram, All Saints in this city, and many others.

But why, it may be asked, should not the minor churches reproduce accurately on their smaller scale the multiplied features of the cathedral? The answer is that in some points it would be impossible—in others highly inexpedient. Multitudinous repetitions of arches in a church of moderate length would produce arches of a ridiculous smallness; and the attempt to give three storeys would only produce pettiness instead of grandeur.

There is, however, one simple but remarkable expedient by which the architects of our smaller churches strove to communicate impressions of infinitude to that which was by its nature not only finite, but greatly limited. Unable in this case to produce directly infinitude of effect, they yet deemed that through the eye something might be done in the way of suggesting it to the mind. Even numbers, it was perceived, convey to the mind the idea of completeness; there is a wholeness, a finished character about such numbers as four and six and eight. Odd numbers, on the contrary, convey the idea of incompleteness; there is about them a broken character; we habitually think of them either as the preceding even number with an addition of one, or as falling short by one of the next even number. They are suggestive, therefore, of stretching forward and onward, and so far they are akin to infinity. It is doubtless on this account that in our parish churches, where the eye counts eagerly and mechanically the number of arches in the nave or of bays (*i.e.* divisions) in the roof, the number of these is, as far as my own observation goes, in the vast majority of instances, odd. In the case of roofs I hardly ever knew an instance to the contrary; the great and famous modern roofs of Suffolk and Somersetshire are constantly of five, seven, nine or eleven bays or divisions. And wherever in a parochially-sized church the number of arches or bays in the nave is even, there immediately arises an unwelcome sense of completeness; the eye or the mind, instead of being left longing and stretching onward into the unknown and infinite, is thrown back upon itself with that sense of repose which is alike kindred to the spirit of Grecian and foreign to that of Gothic or Pointed architecture. In cathedral churches, however, and large ones generally, the number of arches in the nave is even, but then the number in the choir is odd; in all, therefore, odd.

It is an interesting question, itself closely connected with this subject of vista and multiplication of parts, from what point of view were churches and cathedrals expressly designed to be viewed? And considerations are not wanting which seem to answer the question pretty satisfactorily. Some point near the end of the longer axis of the building it must surely be, since thence the multiplication of parts is most fully realised. And considering again that the east end is that towards which the church idea by ancient tradition tends, since her rites draw us on from the western front to the eastern altar, it is clear which way the old architects would have us turn our faces to estimate best their glorious work. All this is confirmed by the fact that church doors, as an almost universal rule, are at or very near the west end; by our finding that church seats facing eastward are ornamented in the back and not on the front, chancel arches, in the Norman period especially, on the west side more than on the east.

The extreme west end then is, it should seem, the spot of all others for a survey. And it may be added that from this point we have before us the longest line contained within the church; a line drawn, namely, from the eye of the spectator or from the floor line at the west end to the top of the vaulting at the east end. Thus in a cathedral 500 feet long by 100 feet high the line from the spectator to the east end will be upwards of 510 feet. The next best point of view would seem to be such a point in the transept as commands most of the choir.

But I have not yet pointed out wherein consists the distinction in structure between a cathedral or collegiate and a parochial church. That distinction is that the choir is, as a universal rule, placed on a par as to broad architectural treatment with the nave; whereas in parochial churches the chancel, as a general rule, is on a smaller scale, both narrower and lower, than the nave. It is true that in the latest Gothic period they began to run the chancels on continuously with the nave, with like height and breadth, but this seems to be rather

a debasement than accordant with the genius of parochial church architecture. The reason of the distinction thus made is obvious. In a parish church the number of clergy is likely to be two or three at most, and their position is that of a few leading the services of the great body of the faithful; hence a modest dimension and altitude become the rule of chancels though at the same time the utmost beauty of details is fully lavished on them.

The theory of cathedrals, on the contrary, or of collegiate churches, is that of a considerable body, clerical and lay, living for the constant discharge of a high service—a service at which the attendance of the people is so far an accessory only, that it goes on whether they are there or not. It demands, therefore, for its architectural maintenance and expression equality, at least in all the nobler characters, such as those of breadth and height, with the nave. And so we find it. The rule of cathedrals is, that their choir be as high and as broad—some times as long—as their nave.

One more element of sublimity, common happily, though still in different degrees, to parochial and cathedral church architecture, may be mentioned. All writers on the sublime and beautiful, from Longinus to Johnson and Burke, have recognised some degree of gloom, or rather of indistinctness, as an important element of it. In sacred poetry the figure dimly perceived by Eliphaz, when "it stood still, but he could not discern the form thereof," and the description of death in Milton,

The other shape,
If shape it may be called that shape had none,
Distinguishable in member, joint or limb—(Bk. ii.),

have been justly commended as instances of this. A noble and more refined turn has been given by the great devisers of church architecture to this element of sublimity. Partly for the sake of contrast with ordinary and secular interiors, partly for the sake of the solemnising effect produced by tempering, subduing and colouring the natural white light, they had recourse to those expedients which are so familiar to us in the various forms of stained glass. It is, I conceive earnestly to be maintained that the primary object of stained glass is not to hang beautiful pictures on church walls. No, the "dim religious light," Milton (no Puritan in this) rightly perceived, is the proper aim of the "storeyed window," however "richly dight." Yet not a dim light merely, but a light coloured as well as subdued, till "all the air," as it has been happily expressed, "is thronged with shadows bright." And surely a beautiful thought it was, seeing that all ordinary secular matters are of necessity transacted in the common light of day, thus to resolve that light, for the uses of our more sacred hours into those rainbow hues which invest the type of mercy and peace. Partly, then, for the sake of a darkening and solemnising indistinctness, partly of beauty and symbolic meaning, do we fill our church windows, according to our ability, with the cunning workmanship of the artist in glass. A view which it is the more important to dwell upon in the present day because it is in a great degree independent of the particular artistic merit of the several specimens.

It may be observed, too, that there is less difference, perhaps, in this kind of sublimity of effect than in others, between cathedral and ordinary churches. The vaster body of coloured air, for such it really is in the former, added to the aerial distance, of course enhances the effect. But the smallest sanctuary may be rendered wonderfully imposing and awing by darkening down and colouring of the light; the principle is the same in all. The light itself enters veiled into the sanctuary.

Awed by a Holy Presence, sadly fair,
The daylight enters reverently there;
Still shedding, as it veiled and dimly falls,
Unearthly fresco on the mellowed walls.

It will be perceived, and must have been often felt, that when we would speak of the effects of church architecture, we as by a sort of necessity, have recourse to poetry. It is no unnatural. There is in truth the closest communion between poetry and church architecture. A cathedral, it may be boldly said, is a material poem; an utterance of sacred thought through the medium of sublime combinations, not of word but of the natural elements; the produce of the quarry, the forest and the mine. It sends up, even as it stands, the continual melody of its beauty and its harmony, its grandeur and its strength; and what can the finest poem, set to the noblest music, do more?

Of the poetical character of cathedral architecture in particular, no more striking proof can be found than the fact of its having proved a source of inspiration to our greatest poets, secular as well as sacred—from Shakespeare to Wordsworth and Sir Walter Scott, and from Milton to Keble. On the principle that nothing which is not in itself poetical can inspire fine poetry, we may fearlessly appeal to this proof of the poetical character of church architecture. It would be deeply interesting to form a complete collection of passages of this description. It would

be found that in many instances church architectural effect has been the latent and unsuspected source of the inspiration. Thus when Milton says, "Let the bass of heaven's deep organ blow," the comparison is not merely between an organ and the winds, but between the vaulted skies and a cathedral, resounding with the full power of its organ.

This same comparison, of a large church interior to the visible heavens, is an obvious yet a noble one; and though daring, not puerile or unreasonable. No one has carried the comparison to a greater height, filled it with more exquisite imagery nor clothed it in more ravishing language than Shakespeare. If we bear in mind that the vaults of cathedral roofs, choir roofs especially, were frequently coloured to represent the sky, and thickly powdered with stars, called in architectural language *pateræ* or *patines*, and remembering too the ancient notion of the music of the spheres, and the mention in Scripture that at the Creation "the morning stars sung together," we shall be at no loss to trace the inspiration of the following passage to its true source. The visible heavens at night are evidently represented as a material choir, the *pateræ* stars as choristers, accompanying with their voices the music made by angels and cherubims in higher and unseen heavens.

Here will we sit, and let the sounds of music
Creep in our ears; soft stillness and the night
Become the vouchers of sweet harmony.
Sit, Jessica: look how the floor of heaven
Is thick inlaid with *patines* of bright gold.
There's not the smallest orb that thou beholdest,
But in his motion like an angel sings,
Still quivering to the young-eyed cherubims.

Congreve, also a dramatic and therefore secular poet, bears his testimony to the poetry-inspiring power of a grand church interior. His inspiration is indeed less true; but its source is equally undeniable. The following lines in the "Mourning Bride" were pronounced by Dr. Johnson the finest poetical passage he had ever read:—

How reverend is the face of this tall pile,
Whose ancient pillars rear their marble heads,
To bear aloft its arched and ponderous roof,
By its own weight made steadfast and immovable,
Looking tranquillity! It strikes an awe
And terror on my aching sight.

These are noble lines; the writing of one who had felt his whole being mastered and subdued by the sublime interior effects which he describes. They are carried, however, I conceive into a fault, where they speak of terror as well as awe being inspired. The feeling engendered by this kind of sublimity is not terror, but awe, as the poet had at first rightly said; not the fear of evil, but the sense of being in a majestic and soul-subduing presence. This accordingly is Coleridge's just discrimination between the effects of Grecian and Gothic architecture in the mind, viz. that in the one case we are lost in admiration of the power of man; in the other, admiration itself is swallowed up in the overwhelming sense of our own nothingness.

The lines of Milton on cathedral architecture and music, already referred to, are too well known to need repetition; Wordsworth's sonnets on King's College Chapel and Sir Walter Scott's comparison of Staffa to a minster, scarcely less so. I will only add, therefore, in proof of my position and in conclusion of my paper, a passage from each of two great poetical minds of our day, the one uttering itself in verse, the other in prose—Mr. Keble and Mr. Ruskin. The following lines from one of the best poems in the "Christian Year" (Third Sunday after Epiphany), bespeak an exquisite appreciation of those elements of sublimity and beauty to which I have here endeavoured to draw attention, viz. the dazzled astonishment arising from the multiplication of similar parts; the awe inspired by perpendicular altitude; and the sense of superiority impressed by the apparently interminable reaching away from us of the ever-throwing vistas of aisles. He is speaking of the glorious mission of the church or cathedral architect:—

He, too, is blest whose outward eye
The graceful lines of art may trace,
While his free spirit, soaring high,
Discerns the glorious from the base;
Till out of dust his magic raise
A house for prayer and love and full harmonious praise.

Where, far away and high above,
In maze on maze the transepts sight
Strays, mindful of that heavenly love
Which knows no end in depth or height,
While the strong breath of music seems
To waft us ever on, soaring in blissful dreams.

No less eloquent, if less directly religious, is the prose poetry of Mr. Ruskin—speaking not of the interior but of the exterior sublimities of cathedral architecture, a fertile subject which time has not allowed me to speak this evening. He

commends the magnificence of conception "which has scooped the vast portals," as seen in foreign churches, especially in our own of Peterborough, "into the depth and darkness of Elijah's Horeb cave, and lifted out of the populous city grey cliffs of lonely stone into the midst of sailing birds and silent air."

SOMERSETSHIRE CHURCHES.

AFTER the meeting of the Somerset Archæological Society in Bristol several members visited some of the churches in the northern division of the county. Mr. Edmund Buckle, diocesan architect, explained the character of the buildings.

Whitchurch.

The first seen was Whitchurch. Mr. Buckle said it was a very good one to begin with, because it was a very characteristic example of the early Somerset style—the style which started from Wells and Glastonbury, and of which they found fragments in various parts of Somerset, and which spread itself into South Wales and Ireland. He drew their attention to the arches under the tower. The arch itself was perfectly plain, without any moulding on it at all, and it was not round but pointed. The jamb which supported the arch was a square, plain mass of masonry except for a little piece of very delicate moulding just below the spring of the arch. This was an early example of the transition from the Norman to the Gothic, and it was carried out in a manner which was local in its nature. The small shafts not reaching down to the ground but just supporting the capital were one of the characteristics of the style. He explained how in the twelfth and thirteenth centuries Somerset masons carried this style to Ireland, mentioning instances in Dublin where it was seen. The east window and the window of the south transept had retained their original tracery, which was of a rather advanced geometrical type which they might call Early Decorated, and all the mullions and divisions were worked in a very delicate fashion and out of very narrow stone in all cases. There were very delicate mouldings to be seen both inside and outside, and also the capitals were particularly to be noticed.

Lieutenant-Colonel Bramble added that in this church they had coloured glass of various degrees of badness, and they put a window with very dark glass over the pulpit in order to make it as difficult as possible for the incumbent to read his sermon. He supposed they wanted to force him to do it from memory. It showed the importance when stained glass was going to be put into a church that it should be done in connection with the architect or someone who was capable of looking a little beyond the window.

Stanton Drew.

Some information was given about the church by the Rev. H. T. Perfect. He said that the structure had gone through great changes, and but little of the earlier building remained. The upper part of the tower as far as the bells was taken down in 1847, and not rebuilt to its former height. The lowest part of the tower belonged to the thirteenth or fourteenth century. The interior of the church, too, had been much altered since the fourteenth century. In the wall they saw the old spiral staircase which led to the rood-loft in front of the old chancel. When the plaster was removed in 1889 traces of a text in old English black letter were to be seen over the upper doorway of the staircase, and remnants of coloured scrollwork above, running along under the wall-plate. In 1847 the central arcade was removed about 3 feet to the north, making what was then the narrower now the wider of the two aisles. The bosses on the roof, Caroline or Jacobean, were worthy of notice. In the north wall of the old chancel were apparent signs of a thirteenth-century window; it was not known when the old chancel was surrendered and the new one built. In 1889 the interior of the church was entirely rearranged, excepting structurally, and decently furnished.

Mr. Buckle spoke of the Decorated period as exemplified in the building. He said that architecture of that period was rare in Somersetshire, many of the churches in the county being Perpendicular. The work they saw was plain, and they might ask why it was called Decorated. The fact was that the bulk of Decorated work was the plainest ever put up, and the name was an unfortunate misnomer caused by the persons who first took up the study of Gothic architecture being struck by the richness of some specimens of it.

Chew Magna.

At this church Mr. Buckle first pointed out the Norman doorway, and said there were various signs on the outside of the church on that side of very early work, if not Norman. They observed inside that the arcade on the south side, running right through from wall to wall, was Early English in date; this arcade became finally the chancel wall, and ended up outside on a pilaster buttress. It looked to him as if the pilaster buttresses, which at first sight appeared to be Norman,

were really of rather later date. It was not a church which suggested an early plan. The building to start with must have been a nave and chancel, without any intermediate tower, and without anything to suggest the cruciform shape which they generally met with. If the tower was not in the centre of the church it was generally on one side of the nave; whether or not that was so there, there was nothing to guide them. The bulk of the church seemed always to have followed the present lines—to have throughout a rather wide nave, with aisles and a chancel beyond. In the chapel at the end of the south aisle they would notice that there were two windows, one above the other, indicating that that chapel was a two-storeyed building, and on the outside a place where the wall had been filled up, where obviously a doorway had been, that doorway being at the level of the upper floor. The manor-house of Chew Magna stood near the church, and they might have noticed what a long circuit the road made in approaching that place, in order apparently to come round the manor-house at a distance which would not interfere with its pleasure grounds. That manor house had belonged to the Bishop of Bath and Wells, and they were told that there was a bridge or gallery connecting his house with the church, and that in the church he had a private pew in an upper storey, which was approached by the gallery. Mr. Buckle reminded the members of Thornbury Church, where the Duke of Buckingham had had a similar privilege, and of St. George's, Windsor, where the royal pew was in an upper floor overlooking the altar. With regard to the screen, it must have been made up somehow or other out of the fragments of the old screen, and that was why it looked so poor and thin.

Chew Stoke.

Mr. Buckle said that Chew Stoke Church had been entirely rebuilt in modern times. The two aisles, they would notice, were entirely different in character. One was very florid inside, with angels sculptured all over it, whereas the other was of excessive plainness. When the place was taken down and rebuilt the then rector desired to have one part of the church rebuilt as it was before, and the south aisle was so rebuilt. It happened to have been a Decorated aisle of the plainest description, but when he was rebuilding the church the rector wanted to have some decoration in it, so he decorated the other aisle to make up for the plainness of the original Decorated one. The arcade was interesting from the point of view of showing that the builders of the Decorated period would stop at nothing in the matter of plainness. The great point of interest was the lovely tower and spire; it was one of the most elegant erections they had in Somerset. It was on a small scale, but the pointed and elegant spire, the charming battlements around, the figures preserved in their niches and the outline of the buttresses altogether made a very perfect picture. Only one of the figures could be identified; that was in the niche looking out over the church, and the figure was, as one would expect, the patron of the church, St. Andrew. One of the altars was dedicated to Maid Uncumber, who was not a very moral sort of saint, for wives were in the habit of petitioning her when they wanted to get rid of their husbands, and conciliated her with offerings of oats.

One of the members suggested that they were wild oats.

Lieutenant-Colonel Bramble humorously defended Maid Uncumber's character, having discovered some documents relating to her in St. Mary-le-Port Church, Bristol.

Dundry.

At Dundry Professor Lloyd Morgan described the geology of the quarries, from which much of the stone used in construction in Bristol and the churches round came.

Mr. Buckle said it was a quarry which, in his opinion, had had a very serious influence upon the course of architecture. He drew their attention to the absolute perfection of the outlines of the church buttresses. There was no mark of weathering anywhere. He observed that in the twelfth century Somerset masons went over to Dublin, where there was no stone, and took over, as he believed, this Dundry stone with them, the only style known in Dublin in the twelfth and thirteenth century being the Early Somerset style.

Brislington.

A paper by the vicar, the Rev. A. Richardson, on the history of the building, was read. It was stated that the church was dedicated to St. Luke, and was generally supposed to have been built in the fourteenth century. It might have been founded in connection with Keynsham Abbey by one of the De la Warre family, who were lords of the manor of Brislington from the eleventh to the sixteenth century. The church, which was built in the Perpendicular style, originally consisted of a chancel and south transept (certainly a chapel), a south porch and an embattled tower 90 feet high, and a nave with a south and middle aisle. The chapel, which was built in the south transept, and the only remains of which was

the piscina, was supposed to have been built for the De la Warre family, and a slab now resting on some debris near the south entrance gate to the churchyard was said to have been an altar. Mr. Buckle, however, was of opinion that this slab was the top of a monumental tomb, upon which a figure, probably representing one of the De la Warres, formerly rested. A stone in the churchyard commemorating the great age to which Thomas Newman attained was probably the work of an enthusiast. Possibly the man did live to be 103, and when the stone was refaced it was difficult to tell whether the middle figure was a nought or a five, and the carver gave the five in benefit of the doubt, making the age 153. A man named Newman used to pilot the ferry boat across the Avon to St. Anne's Chapel in olden times, but he may not have been a member of the same family.

Mr. Edmund Buckle said that he should call the architecture of the church, which Mr. Richardson had spoken of as Perpendicular, Decorated. The Decorated style was essentially a transitional style; it was a long transition from a very definite style which they called Early English to another very definite style which they called Perpendicular. The chancel was very much out of the centre line of the arch. The tower, he considered, was well worth looking at, and was of the same type as that which the members saw at Chew Stoke. In the case of Brislington, the four niches in the parapet are filled with original figures, but they had this peculiarity about them, that the figure overlooking the nave of the church does not appear to represent St. Luke, at the present time the patron saint of the church. In this case they had a bishop in that position—merely a bishop, since there did not seem to be any means of identifying him further. The other figures are the Virgin and Child, the exhibition of the Host, and a saint who could not be identified.

Bitton.

Mr. Buckle said he regretted Canon Ellacombe's absence because he and his father had been rectors of Bitton over eighty years, and they could understand what knowledge of the building Canon Ellacombe must have under those circumstances. All the alterations made in modern times in the building had been made either by him or by his father, and they had both of them continuously studied the church. It was one of the most difficult to understand that he knew. There was no doubt at all that the building dated back to a very early period. There were fragments left of work which was certain before Norman, and the question about it really was whether they were to call the original building there a Roman or Saxon building. The chancel arch was the place where most of this old work remained. What they saw most prominent in the chancel arch was a modern Norman arch. That arch was put in by the late Mr. Ellacombe in substitution for a classic arch which he found there, that classical arch having been put in by Wood, the Bath architect. Wood had lived in the rectory house against the side of the church and was church warden. At that time the chancel arch was in need of repair and he, of course, repaired it in his most modern style. When Mr. Ellacombe took down this classical arch in order to put up something more in harmony with the rest of the church, he found the remains of a most remarkable arch immediately above, and hidden by this classical work. They could see on the nave side just the start of the arch, but on the chancel side there was a little more left, because they had in the north corner the abacus, the capital from which this early arch started, and which was about the rudest piece of Roman work they could conceive. Above the chancel arch was a rude string-course, and above that the base of a panel. The carving represented a pair of feet resting on a little ledge—the feet of a large stone rood. An arm belonging to this figure had been found. The figure was probably 8 feet in height. Mr. Buckle went on to indicate that the nave must have been at one time very much higher than now. The nave was at present 93 feet long and 27 feet wide, and once was probably more than a hundred feet in length. The question was, How did this great building come to be erected like this? It seemed to him much more to point to a Roman basilica than to any style of building that he was acquainted with as having been set up at later dates. In considering the question of the size of the nave, it was a remarkable fact that the church at Keynsham, about two miles away, had a nave of almost exactly the same dimensions. He thought the two churches must have had some connection with each other—that they were erected by the same people, or about the same time, or else the one must have been deliberately copied from the other. With regard to taking Bitton Church back to Roman times, there was a Roman road which ran through Bitton, and Roman relics had been found there, so there was no doubt that there was a population there in Roman times. The chapel at the north-west end of the nave was built by one of the De Bitton family, who afterwards became Bishops of Exeter. It was an interesting point that the modern work in the church had been mostly done by local people.

Keynsham.

At Keynsham Mr. Buckle referred to the similarity in size of the nave with that of Bitton Church, being 26 feet wide and 100 feet in length. Supposing that it started by being a Roman basilica, as he thought was the case at Bitton, it had changed its shape completely. It was an indication of the different directions in which two churches, which started by being of the same shape and size, might develop according to different ideas. The tower was destroyed by a storm in 1632, and a brief was issued asking for help to repair the damage. In this brief the amount of the damage was by no means under-estimated. Describing the beautiful tower, Mr. Buckle pointed out on the sun-dial on the west front the words "Festina lente," and said they were rather difficult to understand. They appeared to mean that the people were not to hurry to come to church. On the south dial were the words "Venio ut fur" ("I come like a thief"), which were also rather puzzling.

It was humorously suggested that the motto "Festina lente" was put up by a local publican, who might have had his house opposite the church, to let his customers know that there was time to have another drink before going to church.

Queen Charlton and Publow.

The quaint little church of Queen Charlton was also described, and an inventory of the church, dated 1634, was read. At Publow Church Mr. Buckle drew attention to the magnificent tower, observing that the first thing that would strike them about it was the height. It had one more storey than they were accustomed to; there were three above the ground floor, in place of the usual two. He believed that the original design for the tower was the ordinary three-storey type.

Votes of thanks were passed to all who had contributed to the success of the meeting, special mention being made of Mr. Buckle and of Mr. J. E. Pritchard (local hon. secretary).

ARCHITECTURAL DRAUGHTSMEN IN AMERICA.

It was proposed in the report of the committee on education read at the thirty-fourth annual convention of the American Institute of Architects that draughtsmen should be eligible for election as members. A discussion took place:—

Mr. H. L. Warren: I find by conversation among the delegates that there is considerable comment made that one of the changes proposed by the committee on education was passed so summarily; in fact, I was myself rather surprised that it went through without any discussion. I refer especially to the addition of the word "draughtsman" in article ii, section 2. This was proposed by the committee on education with some hesitation, and I think that it ought to have received discussion, and I find now, after the delegates have had a chance to think it over, some of them wish to vote against it. I should like to move a reconsideration. If, however, there is other business now perhaps it had better be discussed to-morrow. The change on which I wish to move a reconsideration is in the very first portion of the report—article ii, section 2, after the words "any architect" add "or architectural draughtsman."

The motion to reconsider was put and carried.

Mr. Warren: I will suggest the reasons which led the committee to suggest that change. It was, in the first place, to provide for the possibility of admitting architectural draughtsmen of distinction to associate membership. It is believed that there are a good many men, men often somewhat advanced in life, who have attained considerable distinction in the art, although simply draughtsmen, who are valued and trusted assistants of architects of large practice. They are not gentlemen widely known necessarily, because the work that they do is known only through the principal for whom they work; but we can all of us think of men whom we know personally whose attainments are as high as a good many practising architects. It was that class of architectural draughtsmen whom the committee had specially in mind. It has been pointed out to me, however, by some of the delegates that that really throws the door open for admitting architectural draughtsmen generally who pass the examinations, and that would not be desirable. It may be a question whether young men will submit themselves for examination under the proposed rule if they have to wait a long time before admission to the ranks of the Institute. If, on the other hand, they waited several years before taking their examination they might then feel not so ready to be examined. If it is thought desirable not to add these words, "architectural draughtsmen," then, I think, we would be forced to create a third class, such as exists in the Royal Institute of British Architects, the probationary, into which draughtsmen should be admitted, having some connection with the Institute, but not being associates. I doubt whether this could be considered under the by-laws, as no notice of this matter has been

given. I think, therefore, perhaps it would be best simply to vote down that amendment and leave the matter as it stands now. If, on further consideration, the board of directors thinks it best to provide for the admission of architectural draughtsmen by special vote, or provide for a third class of ordinary members, that would come up at a later time.

Mr. Geo. B. Post: I was absent from the hall attending to committee business at the beginning of this discussion, but I understand that the amendment has been passed and it is now being reconsidered as far as the question of admitting draughtsmen to membership is concerned. I am opposed to the admission of any clause in the constitution or by-laws which would make it possible for draughtsmen generally to be admitted as associates, but I think it is a great hardship if some particular arrangement cannot be made by which draughtsmen, men who have all of the qualifications that are necessary for membership, possibly for fellowship, but whose circumstances are such, through accident or choice, that they are in the position of draughtsmen may be not admitted to membership in the Institute. I have in my office four or five men who would be eminently qualified to become associate members of the Institute, and one or two of them are qualified by experience and practice to be fellows of the Institute, but who would be debarred from becoming associates from the fact that they are draughtsmen in my office.

I think the matter should be referred to a committee to draw up some regulations by which men in this particular position may be eligible for membership as associates, but not be eligible for election to any office. Perhaps the recommendation of a fellow, in whose office they had been for a number of consecutive years, endorsed by several other fellows who knew their work, would be necessary to make them eligible. I am strongly opposed to any by-law which would make it possible for the army of draughtsmen to become associates of the Institute. But some provision should be made for those special cases of men of merit who, through choice, prefer a fixed salary to the exigencies of business ventures for themselves, so that they may have an opportunity of availing themselves of associate membership. One man in my employ was offered a position as a partner with a man of large practice. This man had been in my office for many years, and after considering the thing for several weeks he came to me and said he had made up his mind that the salary he got was a safer thing for him than the uncertainties of business on his own account. If I mentioned his name there are fifty men in the Institute who would know all about him, and know that he is a proper man to be an associate of the Institute, or, if in business for himself, to be elected as a fellow.

I think this matter should be recommitted. I therefore move, sir, that this article be recommitted to the same committee, and they be requested to see if they can, before the matter is finally disposed of in the convention, draw up some resolution which will make it possible for men of attainments who are draughtsmen to be admitted to the ranks of associate members, but to make it impossible for the army of draughtsmen to claim the same right.

The motion was put and carried.

At a subsequent meeting of the Convention the President said a committee was appointed to which was referred the question whether architectural draughtsmen should be admitted as associates. Was that committee ready to report?

Mr. H. L. Warren: The committee on education have reconsidered that portion of the proposed change which relates to the admission of architects or architectural draughtsmen to the Institute. As the by-law now stands, article ii, section 2, the reading is that "any architect," under certain conditions, may be admitted to associate membership. As the section stands it is lacking in clearness as to whether "practising architect" is intended or not, and that was really the committee's reason for proposing the change. They assumed that the word "practising" had been left out with the idea of admitting also draughtsmen. At any rate, it seemed to them a matter which ought to be made clear, and, assuming that to have been the intention, they proposed to add the words "architectural draughtsmen."

The committee find that that is clearly not the feeling of the delegates, and they are inclined to think that on the whole it would be better, instead of adding the words "architectural draughtsmen," to change the by-law by adding the word "practising," before the word "architect," so that it should distinctly confine associate membership to practising architects, but to add the following section with regard to architectural draughtsmen:—

"An architectural draughtsman, who is over thirty years of age, and who has been in the employ of a fellow of this Institute for five years or more, and shall be recommended by such fellow and two other fellows, and who shall have fulfilled all other requirements of associate membership, may, in the discretion of the board of directors, be recommended for associate membership, and may be elected as provided in the case of candidates for associate membership."

That would cover the case referred to by Mr. Post the other day.

The President: Is that to take the place of the first paragraph reported by you?

Mr. H. L. Warren: There will be a change in the first paragraph by adding the word "practising" before "architect," and adding a new paragraph relating to architectural draughtsmen.

On motion the recommendations of the committee were adopted.

KHALAM-KAR, THE HAND-PAINTED CLOTHS OF INDIA.

THE competition of mill-made European cloth has not only affected hand weaving, writes Mr. M. Azizuddin, in the *Journal of the Society of Arts*, but also crippled all the ancient Indian industries connected therewith. The trade in *khulam-kar*, or hand-painted cloths, which was once flourishing in Bandar (Masulipatam), Cuddalore and other places, has of late steadily declined. The famines of recent years have also helped to stamp out this decaying industry by contributing to the poverty of the classes engaged in it. As a class weavers and painters of cloth are rarely well-to-do, the majority of them being in the hands of the usurious cloth merchants, who take their finished goods in repayment of advances made to them. In famine years, the celebration of marriages being retarded, the demand for cloths of all kinds is diminished, and very often the weavers and the cloth painters have to give up their looms and brushes for field labour or some other occupation. On the return of favourable times most of them return to their profession from the out-door labour, while others, either owing to want of sufficient encouragement in the trade or the loss to a certain degree of their professional skill and delicacy, abjure the craft altogether. The State of course intervenes to help such persons to tide over the famine, but that cannot lead to the material development of the industry or to a substantial amelioration of its condition. The one satisfactory remedy seems to lie in finding a market for it.

Khulam-kar cloths cannot be placed in competition with European productions of a similar character, which, so early as the days of the Mogul Emperor Akbar, attracted the remark of being "the wonderful works of the European painters of world-wide fame." But the boldness of the designs, with the careful draughtsmanship of the minutest details, and their general finish and harmonious colouring, give them a fascination of their own, and this, taken with their cheapness, would necessarily find them favour in the eyes of many purchasers, if they could only be introduced in merchantable quantities into Europe. They can be utilised as tablecloths, bed-sheets, curtains and other articles.

The process of making these cloths is remarkably primitive and simple. The first stage in the process is the preparation of the cloth for the painting. This is done as follows. A sufficient quantity of gall-nut is powdered and boiled in water and the sediment is removed, after which one-fourth measure of buffalo's milk, or one-half measure of cows' milk, is mixed with water; the cloth is then put into it and saturated, and after a time it is taken out, strained, and allowed to dry. It is subsequently folded and beaten down with a dyer's block. The cloth is now ready for purposes of painting. The painter takes a quantity of alum and boils it in water. With this solution, which gives a pale dark colour, flowers and other objects are drawn artistically with a brush, or printed with a block on the cloth. The cloth is now dried, and gently washed in water. It is then boiled in water with pounded roots of nuna (*Morinda umbellata*). During the continuance of the boiling process, which lasts for nearly three hours, the cloth is frequently stirred up with a stick. It is then taken out and left to cool. When cooled it is immersed in water mixed with sheep-dung and immediately taken out. It is again washed well and dried by spreading for nearly six hours over the damp sand in the river bed. This process renders the vacant spaces between the flowers white. The white portions are then coloured with dyes of local manufacture, or with any European dye after it has been boiled with gall-nut water. White and black are believed by the Hindoos to be the origin of all colours, and are looked upon as extremes and as the component parts of the other colours. Indigenous black colour is obtained by burning pieces of old iron in dry plantain leaves, and then boiling them in water with sugarcane jaggery and pounded marking-nut (*Semicarpus Anacardium*). Yellow is manufactured by dissolving Bengal saffron with aplakaram, a substance akin to soda, and boiling in water with gall-nut flowers. Green colour is obtained by dissolving pure indigo in similarly treated water. Other colours are prepared by similar devices, and each colour is painted in separately. Finally, the cloths are soaked in boiled rice water and strained. They are then ready for the market.

The price of a bed-sheet of *khulam-kar* ranges from Rs. 1½

to Rs. 2. It is durable and of fast colour, and is commonly used by Mussulmans of Singapore and Sumatra and other places. In India it is largely in demand on marriage occasions, when it is used by the middle classes as a covering, or *palang-posh* (Anglice, "palampore"). It is also largely utilised in the decoration of Hindoo cars. This art was apparently introduced into India by the Mo(n)gols from Persia and in the days of Akbar, who showed a great predilection for the art of painting in all its applications, and gave it considerable encouragement. Abul Faz writes that the work of all painters was weekly laid before the Emperor, and they were rewarded according to the excellence of their workmanship; and that in this way much progress was made in the commodities required by painters, and that the mixture of colours was especially improved.

Although the Mussulman religion prohibits the drawing of likenesses of living objects, yet Akbar, with his wonted liberality of thought, not only encouraged the art of such painting, but even censured those who had on religious grounds imbibed a hatred for it. One day, at a private party of friends, the Emperor is said to have remarked:—"There are many that hate painting, but such men I dislike. It appears to me that a painter has quite peculiar means of recognising God, for a painter, in sketching anything that has life and devising its limbs one after the other, must come to feel that after all he cannot bestow life upon his work, and is thus forced to think of God, the Giver of life, and will thus increase in knowledge of God."

It is to be hoped that the *khulam-kar* cloths may find a market in England and Europe and America, in which case this vanishing industry will be resuscitated in India, and thus a portion at least of the Indian population, whose sole occupation is agriculture, will be better able to withstand the calamities to which they are recurringly exposed in seasons of scarcity.

TESSERÆ.

Arrangement of Organ Fronts.

IN representations of the oldest organs (which are, of course, very small) we find the pipes arranged in their natural order, the longest to the left hand and the shortest to the right, like the wires of a pianoforte or the strings of a harp. There are some pictures of organs of the fifteenth century, when, it must be observed, church architecture was declining, in which the largest pipes are placed in the middle and the smallest at the sides, a plan frequently used now for the pipes enclosed in swell-boxes. In other organs the reverse plan is adopted, putting the smallest pipes in the middle and the largest at the two sides. But the most common arrangement for pipes that are not seen is a sort of compromise between the latter plan and the natural arrangement, and consists in putting most of the pipes in their natural order, but some of the largest pipes at the right hand. This arrangement is neither simple nor symmetrical, and consequently is very unsightly, its chief (if not sole) advantage being that it suits pretty well the forms usually chosen for the fronts of organs without requiring such expensive and complicated mechanism as a thoroughly symmetrical arrangement. It has been thought proper for about four centuries past to build them with fronts symmetrical, as far as the eye can judge, with respect to right and left. So strongly have organ-builders been impressed with this imagined necessity, that though the Abbé Vogler at the end of the last century employed his ingenuity in simplifying the interior construction of the organ, a principal part of his system being that all the grooves which convey the wind to the pipes should be arranged in their natural order, and though his system has been adopted in its main features by several organ-builders, it does not seem to have occurred to the abbé himself, or to those who have taken up his system, that the front pipes also might as well be arranged in their natural order. Indeed, one of the objections started against Vogler's simplification system is the slight difficulty of accommodating it to a symmetrical arrangement of the front pipes. But, to state the question concisely, is it wise to go to a considerable expense in roller-boards and conveyance tubes, contrivances which do not improve the working of the instrument, but the contrary, only for the sake of having the front pipes symmetrically arranged? We may observe, by the way, that the apparent symmetry of most organ-fronts is unreal, for the corresponding pipes are not, in fact, of the same length, as will be evident on looking at the other sides.

Influence of German Glass Painting.

It can scarcely be doubted but that much of the extravagance which we find in later German architecture arose from the reaction of the glass painters on the builders. When fir painted glass was extensively introduced, the figures were grouped or separated by architectural details, such as niches, canopies, copied literally from the stone ornaments of the

building itself. Before long, however, the painter, in Germany at least, spurned at being tied down to copy such mechanical and constructive exigencies; he attenuated his columns, bent and twisted his pinnacles, drew out his canopies, and soon invented for himself an architecture bearing the same relation to the stone Gothic around him that the architecture shown on the paintings of Pompeii bears to the temples and buildings from which it is derived. In Germany, painters and builders alike were striving after lightness, but in this the painter was enabled by his material easily to outstrip the mason. The essentially stone character of architecture was soon lost sight of. With the painter the finials, the crockets and the foliage of the capitals again became copies of leaves instead of the conventional representations of nature, which they are and must be in all true art. Like Sir James Hall in modern times, the speculative mind in Germany was not long, when advanced thus far, in suggesting a vegetable theory for the whole art. All these steps are easily to be traced in the sequence of German painted glass still preserved to us. The more extravagant and intricate the design the more it was admired by the Germans. It was therefore only natural that the masons should strive after the same standard, and should try to realise the ideas which the painters had so successfully started on the plain surface of the glass. The difficulty of the task was an incentive. Almost all the absurdities of the later styles may be traced more or less to this source, and were it worth while, it would be easy to trace the gradual decay of true art from this cause.

Bellini and Titian.

Some excellent judges claim for Titian a distinct religious feeling in art. Inasmuch as he approached the complete artist, he had the capacity, in a high degree, of giving an appropriate expression to even his religious pictures, but this was rather the result of intellectual appreciation than of soul sentiment. So great and well-balanced a mind as his must have been in some degree devotional and imbued with a sense of the importance of religion. But it was not with him the governing feeling as with Giovanni Bellini. This distinction between these two great artists is admirably shown in the celebrated picture in the Camuccini Gallery at Rome, of which the figures are by Bellini and the landscape by Titian, and the Venus and Adonis, hanging beside it, which is wholly Titian's. In mythological subjects, nature and all that constitutes free yet dignified life, sensuous action and high capacities of physical enjoyment or intellectual excitement, we find Titian conspicuous. On the other hand, Bellini, who has brought Jupiter and his celestial court to feast on earth, has wholly failed in spirit. Their carnal feasting is a sad, laboured affair; no one is enjoying himself; all look as if guilty consciences or forced revelry disquieted them. The artist had no feeling for such a scene, and therefore failed in its treatment. The landscape of this picture is particularly solemn and grand. There are no harmony of colours or unity of conception in it, because neither artist painted on a common key, nor entered into the motive of the composition; yet it is, as a whole, one of the most remarkable paintings in Europe from its artistical associations and peculiar treatment.

The Episcopal Mitre in Art.

The episcopal mitre, the cydaris or tiara, worn by Gregory Nazianzen and the crown of St. Ambrose are different from modern mitres, but the latter are nevertheless ancient. The statue of St. Peter, placed in the seventh century at the gate of the church of Corbre, wears a round, high and pyramidal mitre. That of the Popes after this period is similar. In the East bishops, patriarchs excepted, made no use of it, contenting themselves with a staff in the hand. Though the use of the mitre was not common to all the bishops of the West, from the eleventh century, Popes Alexander II. and Urban II. granted the privilege of wearing it to various abbots. It even passed to canons of churches and secular princes. The ancient papal mitres are round, pyramidal and in the form of a sugar-loaf. That of Calixtus II. is flat. The seals have mitres, low, often terminated in an angle, and sometimes resembling bonnets tied with a band behind, the ends of which fall upon the shoulders. The most ancient mitre which has the nearest resemblance to the modern is that upon the seal of the Bishop of Laon in the tenth century. In general, Martenne thus describes the ancient episcopal mitre as double-horned or left, but lower than the modern. No pyramidal mitres occur upon tombs, and the original seals of bishops, after the eleventh century. We find a mitre of the eleventh century very low and wide in the fork. The slit of the fork is also in front. That of Hedda, bishop of Winchester, is low, ornamented or chased round the brim, sharp-sided, with an upright piece in front like the brim, a small cross being on each side; that of Dunstan, an archbishop, is similar, the crosses excepted. In the time of Edward I. they are much higher, but very wide in the fork, and concave, not convex, on the sides. Still, the old straight sides often remained. It has been said that the

episcopal mitres were gold, but the abbatial argent garnished gold, but there appears to have been no reason for this assertion.

The Superseding of Wren.

Bribery and corruption were employed so openly that no one considered Sir Robert Walpole's assertion that "every man had his price" to be untrue. Wren, one of the most disinterested of men, and who knew and studied everything better than the art of enriching himself, fell a victim to the arts of intrigue and bribery. George I. preferred his own country and his former friends both to England and new acquaintances, for whatever faults he may have possessed, desertion of his friends was not among them. But as money had worked such wonders in Paris, and the aid of the Regent of France and his Ministry had been bought at a very high price, the conscientious Ministers of the king of England found it necessary to become sellers, and therefore every place at their disposal became a marketable commodity, including Wren's office of Surveyor-General of His Majesty's Works and Buildings, which he had held with unequalled ability and honour to himself and advantage to his country for a period of more than half a century, being appointed deputy to Sir John Denham, "one of the fathers of English poetry," in 1666, and succeeded as principal, by warrant under the Privy Seal, March 6, 1668, after the death of the poet (who held it more as a means for supplying his necessities than to exhibit his qualifications), till he was superseded in favour of Mr. Benson in April 1718. It is not a little singular that Wren succeeded a poet and was superseded by a poetaster. William Benson was a critic of some repute in his day and a very minor poet. He published, among other forgotten things, "Virgil's Husbandry, with Notes Critical and Rustical," "Letters on Poetical Translations," and an edition of Arthur Johnson's Latin version of the Psalms. In a scarce work, the "Memoirs of John Ker," the author, a man of good repute, asserts that "it is very well known that Mr. Benson was a favourite with the Germans, and I believe nobody had more occasion to be convinced of the power of its influence than myself; so great, indeed, was it that Sir Christopher Wren, the famous architect, who contrived the stately edifice of St. Paul's Cathedral, and finished it in his own time, was turned out of his employment of Master of the King's Works, which he had possessed ever since the Restoration, to make room for this favourite of foreigners." In another part of the same work Mr. Ker says of the corruption of King George's court:—"Robert Walpole, Esq., had obtained a patent for the reversion of a place in the Customs for his son, which Mr. Benson, before mentioned, being informed of, he told Mr. Walpole he was in terms of disposing of it to another for 1,500*l.*, but would let Mr. Walpole have it for the same sum if he pleased; and upon that gentleman contemptuously rejecting it, he so resented it that Mr. Walpole was turned out of his posts and of all favour at court, even at a time when he was about to execute a great public good, that of reducing the National Debt." Thus was removed the man of whom Sir Robert Walpole said "the length of whose life enriched the reigns of several princes and disgraced the last of them."

Flaxman's "Britannia Triumphant."

The mind of Flaxman teemed with magnificent projects; not those airy schemes which arise in the minds of men who want genius to define their conceptions and skill to carry them into execution, and whose plans lie in their own crude fancies, like creation in the obscurity of chaos. He desired to be employed on some national work, and proposed, when the subject of the grand Naval Pillar was agitated, to make a statue of Britannia, 200 feet high, and place it on Greenwich Hill. That he could execute whatever he conceived no one doubted, but in order to show the world that he had not taken up the subject hastily, he published "A letter to the Committee for raising the Naval Pillar or Monument, under the patronage of the Duke of Gloucester," and followed it up by making "A Sketch for a colossal statue of Britannia Triumphant." To illustrate the national importance of such a work, he was ready with instances ancient and modern. But works which offer no immediate gain are too apt in this country to be looked upon as the splendid dreams of a visionary. "It may be all very fine, but what does it mean?" was the general exclamation with which the magnificent proposal of Flaxman was met. The committee deliberated and dined, as committees do, and then let the matter drop, an occurrence which grieved the meek spirit of the sculptor. He had in imagination seen this mighty statue rising in the dignity of form and sentiment, as a landmark "conspicuous far and wide," and he considered the coldness with which the subject was regarded as a fatal symptom. There was no bitterness in his regrets; he was too proud for that. Nor yet was he angry—perhaps he was never seriously in anger in his life; but he grieved deeply, and far more over the deficiency of public feeling than for his own disappointment. Some captious critic of the day said, "Flaxman is not contented with cutting marble into men; he wishes to hew

Greenwich Hill into a woman large enough to graze a couple of goats in her lap." The sculptor only smiled at this, nor was it otherwise when another of the wasps of the hour buzzed out with "There is to be a show at Greenwich of *little* Flaxman and *big* Britannia." The fame of Flaxman was too surely established to be shaken, either by the rejection of his colossal Britannia or by the impertinence of professional jesters. A quick succession of noble works from his hand had made many feel that a sculptor had at length appeared to vindicate the dignity of our national genius.

Whitehall Palace.

Of the magnificent palace which Jones designed for James I. to be built at Whitehall, the Banqueting-house is the only portion of the grand scheme that was erected. It would have covered an immense plot of ground, extending from Charing Cross on the north to Richmond Buildings, by Parliament Street, on the south, and from the river Thames on the east to the parade in St. James's Park on the west, including the site now occupied by the Treasury buildings, Melbourne House, the Horse Guards and the Admiralty offices, &c., as far as Spring Gardens. Four buildings, similar in external design with the Banqueting-house, are in the design, one opposite to it and the others, one near Scotland Yard and the other opposite thereto, and were to be used respectively as a banqueting-room, a royal chapel, a throne-room and a hall of audience. They were to have been connected by a variety of state and domestic apartments, official residences, spacious courts for light and air and every requisite accommodation fit for a royal palace for the greatest monarch in Europe. The circular court, surrounded by an arcade supported by statues, thence called the Court of Caryatides, is one of the finest ideas that was ever devised by the mind of an architect. The whole design is a perfect school for an architectural student, and would furnish texts for a series of lectures on architectural expression or appropriate character, arrangement, grandeur, internal arrangement and domestic comfort, worthy the talents of the most accomplished architect of the day.

Pythagorean Numbers.

Pythagoras considered numbers as the essence and the principle of all things, and attributed to them a real and distinct existence, so that in his view they were the elements out of which the universe was constructed. How he conceived this process has never yet been satisfactorily explained, but he was probably led to the supposition by observing that the periodical occurrences in nature, and almost all institutions and religious regulations and observances in Greece, were founded on numerical relations. Pythagoras thus traced the various forms and phenomena of the world to numbers as their basis and essence. But he did not stop here, he ascended still further to the principles of numbers themselves. These principles he conceived in the form of contrasting pairs, such as straight and curve, limited and unlimited, one and many, odd and even, and others. Further, he traced these contrasts to one first principle and element, the unit, which included both the even and the odd, &c., and thus the even was odd. This unit he considered as the formal as well as material basis of all things, and as identical with the one supreme being. The decad and tetractys or the quadrate, are likewise described as perfect numbers, and first principles; the triad was called the number of the whole, because it had a beginning, middle and end.

Art in Early Rome.

For the first 600 years of their national existence the Romans were mere barbarians in art. Their soldiers wantonly destroyed both the pictures and statues of Greece. After the capture of Corinth innumerable treasures of taste were sent to Rome, and their exhibition gave its citizens their first ideas of art. But so little was even their general, Mummius, acquainted with the value of the statues and pictures, whose beauty for the first time captivated his eye, that he required of those charged with their conveyance, in case of loss or injury, that they should furnish new. Grecian artists were also transported to Rome, and either sold as slaves or reduced to the condition of artisans. Deprived of their personal freedom and those sources of inspiration derived from national independence, their art degenerated into mere imitation.

GALWAY ARCHÆOLOGICAL AND HISTORICAL SOCIETY.

THE second half-yearly meeting of the above Society lately was held at the Railway Hotel, Galway.

The president (Hon. R. E. Dillon) presided. He proposed the formal election of candidates, and in doing so said that he was one of those who joined at the beginning of the Archæological Society a year ago. Since that time their membership had come up from a small number to 100, and added to that would be 13 who now sought admittance. He

rejoiced to say that the success of this Society as regards membership must be attributed to the energy of their untiring hon. secretary, Mr. Richard Kelly. They started this movement in the dark period, and when people would take no interest in it. All that had now changed. He (the president) regretted that up till now he had not taken a very active part in the affairs of the Society, but he would assure them that his absence was not due to want of interest, but owing to a bereavement which he had sustained.

Mr. Kelly (hon. secretary) then proposed the re-election of the late officers. All were taken separately, and the same officers re-elected.

Mr. Francis J. Biggar, Belfast, then proceeded to deliver a lecture on the ancient Abbey of Kilconnell, which was illustrated by excellent limelight views. The lecturer spoke for more than an hour, and was frequently applauded. His paper was a most interesting and carefully prepared account of that interesting Franciscan foundation.

At the conclusion of the lecture the Hon. M. F. Morris, M.P., proposed a cordial vote of thanks to Mr. Biggar, which was seconded by Mr. Perry, and spoken to by Dr. Cox, F.R.U., F.R.C.S.I., and cordially passed.

The following were elected members:—Dr. Cox, F.R.U., F.R.C.S.I., Dublin; Charles Kelly, K.C., J.P., Newtown; Professor Percival Wright, vice-president of the Royal Society of Antiquaries and president Royal Irish Academy; C. Tennison, Hobart, Tasmania; D. O' C. Donelan, J. P. Syllan, P. J. Lynch, Limerick; E. Lupton, solicitor, Tuam; P. J. Conroy, solicitor, Galway; R. Simmons, Galway; W. Fogarty, Galway; Dr. Sealy, Galway.

Papers on "Bunowen Castle," by M. J. Blake; "The O'Madden Country," by Dr. More Madden (Dublin); "The Corrib and its Islands," by Richard J. Kelly; "Headford," by E. H. Knox, were submitted, and will be published in next issue of the Society's journal.

GENERAL.

The King has been graciously pleased to grant permission to Messrs. Doulton & Co., Ltd., to use the title "Royal" in describing their potteries and manufactures.

An Archæological Congress is to be held at Athens in April 1903. Five meetings will be held at that city, and ten excursions will be made to places of importance.

Signor Fabio Gori, an Italian official, claims to have discovered the tomb of Petronius at Rieti.

A Hippodrome has been erected in Brighton on the site of the Ice Skating Rink, from the designs of Mr. Frank Matcham.

The New Steyning Workhouse, of which Messrs Clayton & Black are the architects, will be opened on September 26.

Mr. Patrick O'Sullivan, A.R.C.A., has been appointed junior art inspector under the Department of Agriculture and Technical Instruction for Ireland.

The Promoters of the Louisiana Exhibition, to be held in 1903, are endeavouring to make it more extensive than the Chicago World's Fair.

Mr. Oliver Morris, a well-known engineering contractor, died last week at Bristol.

M. Pellpot has been commissioned to make a picture of the naval review to be held at Dunkirk in the middle of September.

Mr. Augustus St Gaudens, the American sculptor, is to undertake the memorial of C. S. Parnell which is to be erected in Dublin. It will be completed in five years, at a cost of 40,000 dollars.

The Artisans of Birmingham, working through the medium of their trades council, have organised a movement for providing bursary scholarships for the children of their class in the Birmingham University. In furtherance of this object a polytechnic exhibition was opened last Monday at Bingley Hall.

The Odéon Theatre, in Paris, is now being restored and decorated under the direction of M. Barth, the official architect for the building.

It is stated that three lifts have been ordered from an American firm in New York State for Buckingham Palace. They are run by electricity and are to be installed by American workmen.

The University of California is forming a department of research to study American Indian antiquities, folklore and languages. An attempt will be made to rescue all the fragments of folklore possible.

A Good Roads Congress will be held at the Pan-American Exposition on September 16-21. It is proposed to have addresses on the financial and engineering features of road building, to exhibit all kinds of tools and machines for highway work, and to construct sections of earth, gravel, stone, tar macadam, brick and other types of roads and streets.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

LONDON.—Nov. 15.—Designs are invited for new offices for the Hearts of Oak Benefit Society in Euston Road. Premiums of 100*l.*, 75*l.*, 50*l.* respectively are offered. Mr. Sydney R. J. Smith, architect, 14 York Buildings, Adelphi, W.C.

SHEFFIELD.—Sept. 30.—Designs are invited for a Memorial to Her late Majesty, Queen Victoria, on the site now occupied by the monolith in Fargate, such Memorial to include a statue of Her late Majesty. Prizes of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the three best of the unsuccessful competitors. Messrs. Wm. E. Clegg & George Franklin, honorary secretaries, Town Hall, Sheffield.

NEW CATALOGUE.

A VERY practical and useful catalogue has reached us from Messrs. Hartley & Sugden, Ltd., of Atlas Works, Halifax. It contains a large number of carefully-illustrated descriptions of the various boilers for the manufacture of which the firm has achieved a well-deserved and world-wide reputation.

Notable among the boilers described are the Independent "Lawrence" boiler for low-pressure steam heating, which is made throughout from $\frac{3}{8}$ -inch thick wrought-iron plates, and all the joints are solidly welded together so that there is no danger of cracking in frosty weather or through sudden expansion. This is a little more expensive than some other patterns, but presents an unusual amount of heating surface by an inner circle of tubes and a circular flue round the boiler. Two of these boilers of the largest size are heating the Apollo Theatre in Shaftesbury Avenue.

The Independent "Effective" boiler, of somewhat similar type, but with increased heating surface provided by bent tubes in the firebox and two large open flues behind the firebox. Messrs. Hartley & Sugden have fixed a large number of these boilers, and they everywhere, we understand, give great satisfaction. The Independent new patent "Hornet" boiler, for low-pressure hot-water heating, which is so designed that in the spring and autumn, when only a very little heat is required, one side of the boiler can be shut off, thus ensuring a great saving of fuel; the circulation is rapid, and if the water contains any sediment it will all fall below the level of fire-bars, and can be easily removed before the boiler is permanently damaged. This boiler, which is one of the latest patterns, can easily be adapted for heating by low-pressure steam. It has two heating chambers, one on each side of the firebox, and either of these may be shut off at pleasure when a reduced heat is required.

The "Wasp" boiler is especially useful for a smaller apparatus than those already mentioned, although it may be made in larger sizes. Its distinguishing feature is a jacket which provides a flue service all round the outside of the boiler, thus considerably increasing its heating power for the same consumption of fuel.

The No. 3E pattern is a boiler exceptionally useful for hotel purposes, or in any case where a large hot-water supply is required. This boiler is specially provided with waterway bottom, so that no injury can be done to it by the rapid drawing off of hot water.

The "Hotel" boiler is the same boiler with a mantle providing an outer flue, and thus increasing the economy of fuel.

Of course every boiler in the catalogue has its special features, and each one seems to be excellent of its kind.

TRADE NOTES.

THE David Lewis Northern Hospital, Liverpool, is nearing completion. Messrs. Bennington, Son & Harvey are the architects. The whole of the mosaic floors have been carried out by the old-established firm of Diespeker & Co., of London.

THE new public baths which the burgh of Govan have been constructing for some time were formally opened on the 24th inst. The buildings are Classical in design, and involved a capital expenditure of £25,000. There are two large swimming ponds, with a gallery capable of holding 600 spectators. Also a laundry and washhouse. The baths, laundry, &c., have been ventilated throughout by means of seven large roof ventilators (Mackay's patent direct-acting) of Classical design to harmonise with the architecture of the buildings. The ventilators have been manufactured by Messrs. Cousland & Mackay, ventilating engineers, 150 Hope Street, Glasgow.

ELECTRIC NOTES.

THE contract for the switchboards for the Stewart Street station and all the sub-stations in connection with the electrical equipment of the city, has been let by the electricity committee of the Manchester Corporation to an electric company in Berlin. The cost of the contract is not far short of 50,000/.

THE quarterly meeting of the Whitehaven Town Council this week was largely taken up by a discussion on electric-lighting arising out of two recommendations of the water and lighting committee, viz. the appointment of an assistant electrician and an increase in the charges for electric current. Mr. Musgrave explained that the former was necessary owing to the pressure of work and the efficient supervision of the valuable plant at the electrical works. The increased charges for current were requisite to meet current expenditure, as on the present rate of charges there would be a considerable deficit at the end of the year. He pointed out that the existing charges were only one-half of the scale recommended by Dr.

Hopkinson, and that the proposed increase would now only be equal to gas at 3s. 6d. per 1,000 feet, 5d. less than the current price of gas in Whitehaven. The recommendations were confirmed.

THE new electric station at Farnworth, from which current will be supplied both for lighting and traction, was opened on Wednesday last. The new building has been erected on land the property of the Council, facing Albert Road, and, together with reservoirs and car-sheds, covers a space of 5,937 square yards. In case of extension the Council possess land adjoining to the extent of 9,841 yards. The frontage to the buildings is of an ornamental character. The steam generator plant consists of three boilers of the "Lancashire" type. In the generating station are three engines, each of 200 indicated horse-power, coupled to dynamos, with space for another if necessary. The elaborate switchboards and all the requisite machinery are of the most approved type. It is a matter of interest that, with the exception of the boilers, the whole of the material and equipment of the works have been manufactured in Lancashire. The tramcar shed, which adjoins the generator station, is not yet completed. It will be built to accommodate fifteen cars, of which eight are now being constructed. The overhead trolley system of tramway has been adopted, and the lighting of the town will be effected by fixing to the standards forty-five arc lamps. Already there is a considerable demand for the supply of the current for business and domestic purposes.

VARIETIES.

WHILE excavating at Maxton, near Dover, some workmen brought to light some Roman pottery in fine preservation.

THE members of the waterworks committee of the Leeds Corporation visited yesterday the proposed new watershed near Masham, power to acquire which was recently granted by Parliament. It is estimated that the ground will provide about thirty millions of gallons of water per day.

THE Auctioneers' Institute of the United Kingdom is to pay its first visit to Scotland next month, when meetings will be held in Edinburgh on the 12th, 13th and 14th. The Institute was founded in 1886. Its president this year is Mr. William Bennett Rogers, London.

A NEW elementary school in connection with St. Ignatius R.C. church, Wishaw, has been formally opened. The building, which is fitted with all modern appliances, provides accommodation for 500 scholars, and has been erected at a cost of 4,000l.

LORD MOUNT STEPHEN has been presented with the freedom of the city of Aberdeen in appreciation of his munificent gift of 25,000l. to clear off the debt on the Royal Infirmary. When he was an apprentice to a draper in Aberdeen, Lord Mount Stephen was tended in the infirmary for six weeks prior to leaving for Canada, and it was in recognition of that attention he cleared off the debt.

ON the 24th inst. the Right Rev. John Dowden, D.D., Bishop of Edinburgh, consecrated St. Ebba's Episcopal Church at Eyemouth, N.B. The small building dedicated in 1887 is now used as the chancel, and the new edifice forms the nave, taking the place of the iron building which was formerly used. The church is of the early English Gothic style of architecture, and was designed by Mr. W. J. Gray, architect, Berwick. It is provided with chairs to seat 200, and it has cost 700l.

A CORRESPONDENT telegraphs to the *Leeds Mercury*:—Considerable alarm was caused among local archaeologists by a statement in the *Westminster Gazette* that the old water tower at Chester was in danger of destruction. On inquiry I find that a portion of the old city wall has been pulled down to permit the widening of the Holyhead line. When the work is completed the wall will be rebuilt. The water tower, however, will not be touched. The citizens would not tolerate such a gross act of vandalism.

THE new Board school in Moston Lane, Manchester, which has been in course of erection for the last two years, has just been completed and opened. Accommodation is provided for 1,230 children (450 infants, 390 boys, 390 girls), and there is ample room for extension. This is the thirty-second school erected by the Board, and the first in Moston, excluding the temporary iron structure in Dean Mount. It has been erected at a cost of over 21,000l. The principal part of the school, which is the largest Board school in Manchester, faces Moston Lane.

By a new process, says the *Moniteur de la Céramique*, carbonate of lime stones can be made which have all the properties of natural stones, particularly useful as lithographic stones. It is based upon a discovery made by the inventor, Mr. P. A.

Winckler, that calcium hydroxid dry is transformed in a peculiar manner by hydrated carbonic acid into carbonate of lime. This last is then compressed hydraulically in metal moulds furnished with little holes above and below. By employment of a more or less fine powder it is possible to give the stone a variable degree of fineness of grain. Thus one can evidently make flags of any dimensions, &c. There is also this advantage, that the stones can be coloured any tint in manufacture.

BUILDING AND BUILDERS.

MR. ROBERT GEORGE SEAMAN, builder, of Crown Street, Ipswich, fell from a scaffolding in Stirling Street on Wednesday and sustained terrible injuries. He died within a few minutes of admission to the hospital. Deceased was supervising the reconstruction of a building.

IN connection with the proposed new church for Elland, Yorks, it has been decided to erect the transepts and half the nave and have a proper roof, instead of corrugated iron, as had been suggested as a temporary device. Contracts have already been let for the work.

PLANS have been adopted by the St. Pancras Borough Council for the erection of blocks of industrial dwellings on cleared sites in Brantome Place, Euston Road, and Prospect Terrace, Gray's Inn Road, respectively, providing accommodation for 584 persons, allowing two persons to each room. The total estimated cost of building is 32,367/.

THE parish church of Pocklington, Yorks, is undergoing a long-needed restoration. The architect is Mr. John Bilson,

F.S.A., of Hull. The condition of the fabric is very bad. The roof of the nave might at any time have fallen in. The pews are worm-eaten and rotten, and cannot be put back. The work at present in hand will not be so thorough a restoration as could be desired, owing to lack of funds.

THE Local Government Board order confirming the County Council Mid-Cheshire Isolation Hospital order has been received by the authorities affected. It contains clauses described as absolutely unique, and puts an end to resistance extending over five years. It imposes upon the Northwich Rural and Northwich, Winsford and Middlewich Urban Councils the duty of providing a joint infectious hospital, which will cost at least 15,000/. In default of the scheme being carried out the County Council will appoint a managing committee, and ten out of eighteen members will be councillors. Singularly enough it is only if the local authorities evade responsibility that the County Council contributes.

It has been officially announced at Buckie, N.B., that the Lords Commissioners of the Treasury have agreed to grant 15,000/ towards the sum required for the construction of a harbour at Craigenroan. The scheme entails the annexation of Portessie and district by the borough of Buckie. The estimated figures submitted embrace a total cost of 45,000/., of which 10,000/ is in hand, exclusive of the Treasury grant. A public meeting of the inhabitants will probably be held to further deal with the scheme.

THE Norton (Malton) Urban Council at their meeting adopted the surveyor's specification for the proposed swimming-bath, and the work is soon to be gone on with. The Council also decided to apply to the Local Government Board for permission to borrow 500/ for extension of water mains and additional pumping power. It is proposed to extend the water supply round by two of the noted training establishments—Whitewall and Spring Cottage—and to the entrance to Colonel Legard's Welham estate.

THE NEW DOCK AT DOVER.

SIR WILLIAM CRUNDALL, the deputy-chairman of the Dover Harbour Board, has made a statement in reference to the scheme for a new commercial dock at Dover. He says that, now the Dover Harbour Board are authorised by the Act

passed in the last session of Parliament to complete the whole of the proposed works, and to increase the poll-tax they have power to levy from 1s. to 2s. 6d. per head, the work will be pushed forward as rapidly as possible. He has reason to believe that as soon as the harbour is ready to receive them, the Hamburg and Bremen Transatlantic liners will make Dover their port of call. At the present moment the *Deutschland*, which draws 30 feet of water, and the *Celtic*, which draws 33 feet, could lie alongside the end of the new Prince of Wales's pier at low water of springtide with 3 feet to spare. But until the Prince of Wales's pier, which has been completed at a cost of about 600,000l., is connected with the South-Eastern and Chatham Railway systems this Transatlantic traffic could not be adequately dealt with. It is proposed to provide the necessary railway facilities in connection with the improvement of the old outer harbour, which is to be deepened. Lock-gates are to be constructed at the entrance to this harbour, and the Prince of Wales's pier is to be connected with the railways by means of lines over these gates. The main portion of the scheme yet to be carried out is the erection of a water station in the commercial harbour. This station, which will be two and a half times larger than Charing Cross Station, will accommodate sixteen trains under cover, and have berths for four cross-Channel boats. The total cost of the works, including the sum required to pay off the debentures on the Prince of Wales's Pier, will be 1,750,000l.; and, assuming that the cross-Channel traffic does not increase beyond its present proportions, it is estimated that a poll-tax of 2s. 6d. per head would produce an annual sum of 50,000l. But Sir William Crundall anticipates a largely increased cross-Channel traffic, in addition to the development of a Transatlantic service, and if these anticipations are realised he believes it will not be found necessary to levy a poll tax of 2s. 6d. He pointed out the benefits which the railway company would derive from being able to run their boat trains to one port; and, in order to illustrate the advantages which the Dover route enjoyed, he claimed that Dover was five miles nearer the Hook of Holland than Harwich, twenty-five miles nearer Flushing than Queenborough, and about three-quarters of a mile nearer Boulogne than Folkestone. He also stated that a Transatlantic service from Dover would probably attract much of the traffic from America which now went to Paris over the Western of France Railway, because the passengers could come to Dover and

cross the Channel, and then proceed to Paris by the Northern of France Railway. It is estimated that the harbour could be prepared for Transatlantic traffic in two years, but it will take four years to complete the water-station.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.

THE new session of the Birmingham Municipal School of Art will, says the *Birmingham Post*, begin on Monday, September 9. During the previous week the Central School will be open to public inspection from 11 A.M. to 9 P.M. daily, and the head master (Mr. Edward R. Taylor) will attend at the times stated in the programme in order, as far as possible, to arrange the courses of study of intending students. Morning, afternoon and evening classes will meet on five days a week at the Central School. The course of instruction includes drawing, design, modelling, painting, architecture, building construction, and technical instruction, under highly trained specialists, in the following amongst other processes:—Metalwork: Raising, repoussé, niello, chasing, etching, engraving, damascening, filigree and metal casting, enamelling, cloisonné, champlevé and limoges, stained-glass work, bookbinding, writing and illumination, embroidery and other needlework, wood carving, drawing for book illustration, wood engraving, the making of decorative cartoons, gesso-work. There are some changes in the personnel of the teaching staff. In the special lectureship on anatomy Dr. Wright, the lecturer on that subject in the University of Birmingham, joins Dr. B. C. A. Windle, F.R.S., who has for many years delivered a brilliant series of lectures at the school. The able services which Mr. W. H. Bidlake, M.A., A.R.I.B.A., has for a long time rendered as special lecturer on architectural history and architectural design, have done much towards giving to this department its distinguished position amongst the architectural classes of the United Kingdom. Mainly owing to his increasing practice as an architect, Mr. Bidlake is unable to devote to the school as much time as heretofore. But he continues his special lectureship in architectural history; and the committee have been fortunate enough to secure as his successor in architectural design Mr. Charles E. Bateman, F.R.I.B.A., ex-president of the Birmingham Architectural Association. Mr. Herbert T. Buckland will continue his attendance in the elementary architectural class on Wednesday evenings, and in both the elementary and

advanced architectural classes on Thursday evenings. Miss May Morris will attend at intervals during the session as special lecturer and teacher of needlework; and Miss Mary J. Newill will be welcomed on her return to the school as teacher of that subject on two mornings and two afternoons a week throughout the session, and occasionally also in the evenings. The death of Mr. Louis Movio rendered vacant a teachership of metalwork. Mr. J. Paul Cooper has been appointed to fill the vacancy thus caused. Mr. Paul Cooper's qualifications justify the hope that he may continue and extend the work of his predecessor. Mr. Paul Cooper was trained in the office of Mr. Sedding, a London architect, who died young, but whose work, especially in Devonshire, early gave to him a high position among experts. Visitors to the Arts and Crafts Exhibition at the New Gallery in Regent Street, W., will recall Mr. Cooper's work. Whilst at Mr. Sedding's Mr. Cooper worked under Mr. H. Wilson, now a leading metalworker, and recently appointed teacher of metalwork at the Royal College of Art. For several years Mr. Cooper has done metalwork both on his own account and in conjunction with Mr. Wilson. Mr. Wilson says of Mr. Cooper:—"His work is of great interest to me personally, and I think it quite beautiful." Mr. Louis Joseph, the enameller and chaser, will continue his attendance in the art laboratories, and arrangements are in progress for further attendance of teachers there on and from September 9. Mr. Henry A. Payne, the distinguished ex-student, who is now well known not only as an exhibitor at the Royal Academy and at the New Gallery, but also as a designer for stained glass, has recently undergone a course of technical training in the stained-glass workshop of Messrs. Lowndes & Drury, London. Messrs. Lowndes & Drury execute all the stained glass made from the designs of Mr. Christopher W. Whall, whose work for English cathedrals and other buildings is noteworthy, and Mr. Payne has throughout his course in London had the advantage of Mr. Whall's supervision and encouragement. Mr. Payne is thus qualified to teach from beginning to end the process of stained-glass work; a room in the school is being equipped accordingly, and an interesting syllabus and full particulars as to Mr. Payne's attendance are given in the programme. For writing and illumination a syllabus appears in the programme for the first time; this class was successfully opened in February last, under the teachership of Mr. Ernest G. Treglown. Some bookbinding has already been done in the school. Mr. Francis G. Garrett,

who was apprenticed to Novello's as a bookbinder, subsequently worked there for several years, and also has been carefully trained under Mr. Douglas Cockerell, the teacher of bookbinding at the Central School of Arts and Crafts, has been appointed to teach bookbinding on Monday, Tuesday, Wednesday and Thursday evenings, in a room adapted to the purpose.

DERWENT VALLEY WATER SCHEME.

THE valley of the Derwent is being made ready for a great change. The water of the river is to be mounded into four big lakes of storage and supply. As Longdendale is to Manchester, and as the Elan valley will soon be to Birmingham, so in due time the Derwent valley will be to Sheffield, Nottingham, Derby and Leicester. The undertaking is a heavy one, and the Derwent Water Board, created in 1899, is responsible for carrying it through. First evidences of the board's activity can now be seen, says the *Manchester Guardian*. Near the confluence of the Ashop and the Derwent a cluster of cabins for housing navvies has made a mushroom-like appearance. There will be one reservoir between Bamford and Ashopton, another near to Derwent Hall, a third further up the valley that will swallow up Howden farm, and a fourth, still higher, that will take the place-name of Ronsley.

There will be much turmoil before the peacefulness that is now first being disturbed is restored. The railway is coming all the way from Thornhill, which is near Bamford, to the top reservoir at Ronsley. Under the shelter of the high moorland at Birchin Lee a thousand workmen will find their temporary dwelling-place. The railway train will take them away to their work in the morning and bring them home to their wives and families at night. Their children will go to school in the daytime; there will be recreation in the evening; the canteen will be a place for refreshment only; a village missionary will be retained—and a village policeman too. The village is nearly ready for its people, and theirs should be a happy and healthy community if they do not vex themselves with ills of their own making. The village may last a dozen years or more, for water schemes are slow of development. Birmingham got Parliamentary powers to go to Wales in 1892. Birmingham is still waiting for a draught of Welsh water, and its workmen's village will not be a deserted village yet awhile. The Derwent scheme will not be completed for many years; indeed, it was stated in the course of the Parliamentary proceedings that

there would be no thought of constructing the supplementary storage reservoir in the Ashop valley—the valley that leads from Ashopton away in the direction of “The Snake”—for twenty years. The speed with which the work will be pressed forward will depend entirely upon the growth of the necessity for its completion. Leicester is urgently in need of an increased water supply. Sheffield, on the other hand, is so well off that the recent drought has occasioned no inconvenience. But when Sheffield found that three other communities were athirst for the only available watershed area to which it could itself turn in case of need Sheffield prudently claimed a share of the Derwent, and Parliament recognised the justice of the claim. The watershed area extends over some 31,946 acres, and it is estimated that the accumulation of water will make available 33,000,000 gallons of water per day. The county of Derby claims 5,000,000 gallons, and the four municipalities are to divide the balance according to a basis of percentage. Each is to bear a share of the cost calculated upon the percentage of water allocated. The total cost will not be less than 6,000,000 $\frac{1}{2}$, and this will cover the construction of the dams and the tunnelling, conduit-making and pipe-laying by which the water will be carried to its respective areas of supply. Sheffield will draw from the larger and lowest reservoir through a tunnel that is to be bored under the craggy escarpment of Bamford Edge. Leicester, which requires a higher-level service, will draw from one of the highest reservoirs. Excavation for the Howden reservoir has begun, but much progress cannot be made until the railway is made. The railway will have a junction with the Midland Dore and Chinley line, and by it all materials will be conveyed. There will be no need to go far afield for stone to make the dams with. The district is full of quarries—so full, in fact, that a Parliamentary committee has ruled that it was quite unnecessary to destroy the natural beauty of Lady Bower valley (Sheffield's approach to Ashopton) by hewing into its sides for stone. Further along the valley, in the Hathersage direction, the stone will be obtained—Hathersage, whence one can see Millstone Edge ruddy against the sky-line, a quarry where the stone is so excellent that it is hewn out and sent abroad for milling work as far as to Norway and to Canada. It has been estimated that the construction of the dams will use up nearly two million tons of stone, and that when the work is begun seven hundred tons a day will be required to keep it going. This alone is an index of the great industrial upheaval that is about to take the place of quiet rural pursuits in the Derwent valley.

ELECTRIC LIGHT AT DURHAM.

DURHAM'S new electrical works, which are rapidly progressing towards completion, occupy a site abutting on to Silver Street Back Lane, and are in extent 120 feet by 90 feet. The buildings are all on the one ground-floor, and, commencing from the river, consist of a cell-room, engine-room and boiler-house, with the company's offices situate some few yards distant to the right. There are two sets of boilers, four in all, by Babcock & Wilcox, the coal being shot direct into the bunkers from the Back Lane. For the sake of economy a Berriman feed-heater has been laid down for the purpose of heating the water before passing into the boilers, whilst the boiler is fed from a large tank designed to hold 55 tons of water. This tank is from the Barrowfield Iron Works, Glasgow, and the feed pumps by Messrs. Weir. There are at present two dynamos, each of 140 horse-power. These are simply for generating electricity for the lighting, it being intended to lay down another dynamo of 280 horse-power when the electric trams are commenced. The electricity is carried from the dynamos to the switchboard, whence it is distributed by the cables to the various parts of the town. In order to maintain an even pressure of the current there is what is called a balancer and booster, which, together with the engines and dynamos, are by the Brush Electrical Engineering Co., Loughborough. The cell-room previously mentioned is for the purpose of storing the surplus electricity, which is kept there for use when there is little demand, thus enabling electricity to be supplied without working the engines. The cells are by the Hart Company, whilst the switchboard alluded to is by Messrs. Verity's, London. The smoke stack, which formerly did duty for the factory, has been taken down to the extent of 25 feet, and rebuilt 40 feet. This work was carried out by Messrs. Reid Ferens, of Durham. The buildings generally are being erected by Mr. T. Weatherell, of Newcastle, the architect being Mr. H. Graham, also of Newcastle. The whole of the work is being carried out under the superintendence of Mr. J. S. Frain, manager to the County of Durham Electrical Power Distribution Company, Limited. The work of laying the distributing mains in the town will be commenced this week by Messrs. Callender. The ground will first be opened out in the South Bailey and the Elvets, and with a view of getting this portion of the work done as speedily as possible for the convenience of traffic, three gangs of men will be engaged. The laying of the cables is a lengthy task, and even with the three gangs at work it is esti-

FISHBURN'S LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c.

This Machine will be found invaluable in Warehouses, Factories, Matings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building. By a simple and expeditious arrangement it can be made to lift or lower at two or more points (or hatchways) to suit the floor spaces.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

mated that ten to twelve weeks will elapse before it is completed. The whole work, both in connection with the buildings and the cables, is being pushed on as rapidly as possible, and the company anticipate being able to commence supplying electricity by November.

THE LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

A STRONG contingent of the members of the Lancashire and Cheshire Antiquarian Society visited Leek on the 7th inst., accompanied by Mr. W. Harrison, their treasurer, and Mr. Yates, F.S.A., their secretary. They were met at the station by Sir Thomas Wardle, the Rev. W. Beresford and Mr. C. Lynam, F.S.A., and the leaders of the day (Messrs. W. Jarr and S. Unwin). They first drove to a fine barrow near Messrs. Broster's Mill, where Mr. Unwin read extracts as to its excavation from Mr. Sleight's "History of Leek" and the Rev. W. Beresford supplied some further details and corrections. Proceeding to the Abbey, Mr. Beresford acted as guide, pointing out a fifteenth-century gateway, a thirteenth-century coffin-lid and the ground plan of the monastic buildings. He then took the party to a large rampart of earth in a field to the east of the Abbey ruins. This rampart, he said, could be traced through Staffordshire in an oblique direction from Buxton to the river Severn, near Newport, in Salop. Mr. Barnes, of Hilderstone, had pointed out a passage in Tacitus which said that Ostorius Scapula about the middle of the first century, had subdued Britain south of the Trent. But Ostorius could not conquer the Lancashire and Cheshire men, and had ruled them off with this line. Dion Cassius, a later writer, also alluded to it; and there was reason to believe that after the death of the Emperor Severus, who died at York in 211, this same rampart divided the country into Upper and Lower Britain. When the Mid-Saxons came some two or three centuries later they found it still difficult to subdue Lancashire and Cheshire, and like the Romans they too were content to make this old line their first frontier. A passage in Green's "Making of England" showed that the middle English got their name of Mercians or Men of the Mark from fighting along this line; and the name of Meerbrook, or Mark Brook, existed to this day. As they saw it the rampart would not long resist an attack. But they noticed where they stood that a number of other ramparts made an enclosure of an oblong shape with rectangular corners. This was a Roman position.

There was another on Gun Hill, about two miles away, and upon these military stations the strength of the line depended. South of Leek the rampart carried a wall, probably like that described in the *Gentleman's Magazine* of 1797, made of the trunks of oak trees closely bound together, and a correspondent who was writing a history of the Offa's Dyke had noticed that Offa's Dyke had in places strong groves of holly planted on it. So had this.

Some of the gentlemen present pointed out that a similar dyke, called the Grey Dyke, ran through Bradwell in Derbyshire, and Mr. Beresford said that was precisely what one would expect, as the Mark ran right across England from the Severn towards Flamborough Head, and would take Bradwell in its way. Cheddleton (Chattel Town), Caverswall and other places were stations on the Mark.

An adjournment was then made to the Abbey House, the residence of Mr. Renney, which the party were allowed to explore.

Passing next to the Hermitage near the Abbey, Mr. Beresford pointed out the hermit's door, roof, fireplace and chimney-track. The hermit had three rooms—a sitting-room, an oratory with an aumbry, and a storeroom at the back. The river then ran in front of the hermitage and close under Abbey Green, and a little herb garden might be noticed hard by.

A move was next made to Mr. Hulme's Farm, Abbey Green, where Mr. Beresford had some surprises in store. He showed the red flakes of rock peeping out of the ground, from which flakes of rock Leek got its name. Here was a quiet bay in the hills, protected from cold winds and open to the sun, where the White Monks, who came from Pulton, near Chester, in 1214, probably spent the seven years from 1214 to 1221, till their abbey was ready for them. He showed the visitors a part of the Mediaeval cross which had formed, he thought, the centre of their place of worship during those seven years. And close by was the quarry where they hewed their stone. The floor of the cell occupied by the superintendent monk had been discovered through the thoughtfulness of Mr. G. Hulme, who, in pulling up a young tree on the spot, found a tile sticking to its roots, and had then bared the pavement. It was when invited to see these tiles that he (Mr. Beresford) had noticed the extraordinary characteristics of the hill in which the quarry lies. These he then pointed out to the visitors, asking them to notice how a bold promontory of rock was cut off from the hill behind it by a deep trench, and how the promontory was made difficult of access by two sharp arti-

ficial escarpments one above the other, which ran round the projecting sides. The top was defended by a rampart and trench, where watchmen or slingers could lie hidden from view, ready to throw missiles at an attacking party. The place excited great interest amongst the visitors, who asked Mr. Beresford questions and made suggestions, one being that the stones were floated up the river to the abbey after the river was deepened for the purpose by a dam. The monks of Rievaulx, in Yorkshire, had floated their stones along special canals made for the purpose.

Mr. Beresford explained that this ancient British station at Abbey Green was linked by roads with other stations. The defenders had provided themselves with a road sunk in the ground along the bottom of Suddendale, deep enough for them to drive away their cattle towards the hills unobserved. That road led to another camp near Tittesworth Farm, and that camp was linked with another at Thorncliffe, and, further off, another near Colt's Moor of a larger size where cattle could be safely enclosed. The last three were camps in the forks of brooks, and were defended at the side subtending the angle by trenches or ramparts. The roads linking these ancient British fortresses together were disused; but those along the Roman line which became the Mark were still mostly in use.

At the tea at the Red Lion a vote of thanks was passed to the Rev. W. Beresford. The president of the Society (Professor Boyd Dawkins, F.R.S., F.S.A.) has since sent him a message of thanks for his kind attention to the members and the excellent descriptions which he gave of the places visited under his guidance. Mr. Boyd Dawkins very much regretted that he was unable to be present.

STEELWORK IN SKELETON BUILDINGS.*

THE present architectural design of buildings in which an iron frame is used for supporting the masonry is the cheapest form of dissimulation, and we can imagine the disgust with which our successors in years to come will regard the work of the present generation. The cause of this trouble lies in the attempt to apply the same architectural details to a skeleton building that are usually applied to a masonry

* A lecture delivered at the School of Architecture, University of Pennsylvania, by Mr. William Copeland Furber, C.E., and published in the *Engineering Record*.

building, or, in other words, to apply the architecture of stone to a structure of iron. The fundamental basis of the present architectural forms has the merit of once having stood for something of utility. The console, the dentil, the pediment, the column all once had a utilitarian office, and to the ornament has been applied until they have assumed a graceful form and have become the words of the architectural language in stonework. But they had the truth for their prototype and they have consequently developed rationally.

The architecture of the iron building of to-day is indefensible, because it is, first of all, a sham, a mere pretence, purporting by its detail to be a masonry structure, yet violating every principle of masonry construction. It is ridiculous to say the least, to see a building in which the cornices, brackets and consoles, which are the visible evidence of the bones of the structure, and apparently support the work above them, are wired or strapped to the iron skeleton. The galvanised iron cornice and similar shams are surely no worse.

The solution of any problem is arrived at by a series of compromises, and any one charged with responsibility should fully understand what these compromises involve from an artistic and utilitarian point of view, for the best results cannot follow when one or the other is ruthlessly sacrificed without consideration, but with a proper appreciation of the value of the two an architectural and structural solution can generally be found which does justice to each, and is also practical.

The first and most important thing to be done after the requirements of arrangement have been determined, is to rough out the plan and fill in the main lines of construction, for if this is done it is surprising how easily the rational development of a scheme will follow. It is well in beginning this method to have more than one approximate plan, and they should not be determined plans. The purposes of the building and its general or specific uses to which it is to be put should have been carefully studied out, and the designer should have fixed in his mind the limitations of the problem, or in other words he should have found out the things he cannot do. It is wonderful how it clears up the atmosphere to possibilities, discover what the impossibilities are. When you have discovered what you cannot do, the things you can do crowd themselves upon you.

Rust Protection.—There is probably no part of the material in an iron skeleton building which receives so little protection from corrosion as the skeleton, and this is because it is covered up. The ancient adage, "out of sight out of mind," is as applicable here as elsewhere.

regarding this neglect as it is in many other matters relating to buildings.

Rustproofing a structure is, however, a very simple matter. Rust in steel or iron is due to three factors working together—water, an acid and oxygen. These three must work together to produce it. Ironwork in a building is liable to corrosion through the presence of water which is probably sufficiently charged with an acid and sufficient oxygen to furnish all the properties required to begin the work of disintegration at once, or, if it is not, can readily acquire them in short order.

Fortunately we have a material which possesses many useful qualities and at the same time the very valuable property of rendering harmless any water which may reach the iron. In the foundations of buildings which are below water level, or near enough to it to be wet by capillary attraction, we cannot hope to keep the ironwork dry, but by neutralising any acid that may be present in the water we can insure against corrosion. Portland cement, because it is a product of lime, furnishes an admirable base for any acid that may be found in water under ordinary conditions, and by reason of this, any water which may find its way through the cement cannot produce rust because only one of the combination which produces rust is present.

It is, therefore, highly important that with one of the three present we keep out the others, and this demands that the concrete be in contact with the metalwork at all points. It becomes, then, absolutely necessary to guard against such defects in the concrete envelope as would permit their entrance.

The concrete should be in the closest contact with the metal, and for this to be possible the metal must be clean—that is, free from mill scale and rust and not painted. In order, however, to protect the metal from accidental corrosion before it leaves the shop, it should be covered with one coat of raw seed oil. This oil is destroyed by the cement, and does not prevent the close contact of the steel and the concrete. In order to come specifications will require that all metalwork shall have the surface cleaned with the sand blast, so that the covering can be applied directly to the metal and not to the scale or skin which ordinarily covers it when it is received from the rolling mills.

After the surface of the metalwork is clean it is best, if possible, to cover its surface with a simple mixture of Portland cement and sand, but as this is not always practicable, a close contact can be assured by using a concrete made with a liberal

proportion of mortar and the aggregate or filler in small pieces, ranging in size from particles as large as a pea to those which will just pass through a $\frac{1}{4}$ -inch ring. If the material forming the aggregate is larger than this, it is apt to bridge over voids and prevent the ramming of the concrete into a solid homogeneous mass. The rate of expansion from heat being practically the same in iron and cement, if the contact is properly made between them they will act together thereafter, so that success in this rust protection demands that the work be done right in the first place.

Above the foundation construction, the next most vulnerable points are the external columns and girders. Rain and moisture can readily find their way through stone and brick walls, and if the metal is not covered with anything more than paint, which the mortar in the masonry has already destroyed in places, it is not a great while before corrosion begins. The concrete envelope should be placed around all external columns and girders, and the inside ones as well, if they are to be efficiently fireproofed. The concrete envelope is best secured in place by a fabric of wire netting of close mesh, which should have its edges bound together where they join. Around this netting should be placed the temporary boxing which is removed after the material has hardened.

Fireproofing.—One of the greatest faults of the modern systems of fireproofing is the thinness of the covering. Any non-conducting incombustible covering will prove reasonably efficient if it is thick enough and thoroughly secured to the columns and girders. The reason the coverings have been made so thin is this:—In the transposition from materials of low resistance like stone and brick to materials of high resistance like iron and steel, the difference in the areas required for walls and piers was so great and the space saved so valuable that the temptation has been to restrict the space occupied by the columns to the minimum. Consequently as little has been allowed for the column and girder coverings as the law allowed, and as a result a good deal of the so-called fireproof covering is insufficient and in many instances improperly applied.

In the fireclay covering and other rigid materials the common practice is to unite the component parts with mortar. This is not sufficient. Coverings of any kind of rigid or plastic materials should be fastened on with wire netting to give fibrous qualities, and prevent separation in case of blows sufficient to break the covering.

plunged into water without apparent disintegration, and is probably one of the most durable materials which can be applied to the protection of ironwork from heat. This knowledge of its virtue, however, has led the manufacturers and the architects to decrease the thickness of the covering to such a point that it no longer answers its purpose in a satisfactory manner. This is particularly true of the covering of the lower flanges of the floor beams, where the covering is only about an inch in thickness. In this detail another great sacrifice is made, namely, that of air-cells. Dead air space is a very poor conduction of heat, but this valuable property has been sacrificed to keep the floor arches of the minimum thickness, notwithstanding the great loss of efficiency in the fireproof covering caused thereby.

A material which combines many good qualities useful in fireproofing is Portland cement, which, if mixed with sand, forms almost an admirable fireproofing material applicable in a plastic state on a wire-mesh fabric to any structural member.

The high temperature at which Portland cement is made indicates its fire resistance. It is also a poor heat conductor, and, if applied properly and in sufficient thickness, with air spaces between the coverings, will answer the purpose of fireproofing very well. It has, however, the defect of its qualities, that is, it can be applied so readily and so easily as to require careful inspection to be sure it is properly mixed and then properly put on.

The fireproof floor is usually made of porous hollow tile, expanded metal and concrete, or wire-mesh arches embedded in concrete. All these floors are good ones if they are carefully put in place.

The porous hollow tile can be easily laid, requiring merely a centreing of flat boards propped up under the floor beams. The tile is strong and easily laid and easily inspected, and defects in tile and laying can be readily detected.

The concrete floors of any construction require inspection in the mixing and the laying. Carelessness or dishonesty in the mixing or carelessness in the laying may lead to bad results later on. The strength of concrete is dependent on the use of suitable materials and careful treatment. Without these good results cannot be expected.

In any system of flooring the flanges of the floor beams should be abundantly protected, for the failure of a floor beam through heat would open a hole in the floor which would permit the spread of fire.

Partitions can be made of several materials; mackite, hollow

tile, expanded metal and wire lath all have their uses and are good. Where a partition is required to be of the minimum thickness wire lath or expanded metal on steel studs permit the thinnest construction. Care should be used to see that a partition is well secured to both the floor and the ceiling near the doorways, for if it is not the jarring of the door is apt to break it loose.

Wind-bracing.—In arranging a building for wind-bracing, sometimes the floor plans will permit a symmetrical arrangement of the cross-section in which the wind-bracing is to be put. Frequently, however, no such desirable arrangement is possible, and only certain sections can be utilised; this complicates matters somewhat, but careful study will usually permit a satisfactory solution of the problem. In some instances, due to the great uplift on the windward side or the lightness of the wall carried by the column, the weight of an adjoining column has to be engaged to contribute its load to the load on the wind-brace column, which is done by means of a stiff diagonal strut. This condition is met with only in high and narrow buildings.

Where each line of columns in a cross-section through a building is not utilised as a stiff section, the lines not so braced should be attached by means of a floor system to the stiff section, so that the unstiffened sections shall transfer their wind loads to the stiff sections at each floor or every other floor. This is best done by a system of diagonal rods below the finished floor line with turnbuckles for tightening them up.

Wind-bracing in a high building performs, during and after erection, the very practical office of facilitating erection, enabling the columns to be maintained in their correct vertical position; for with the best shop work the play of the temporary bolts in the holes is sufficient to allow a serious deviation from the vertical to occur, and with the temporary bracing of wood struts this can rarely be prevented. Departures from the vertical of 2 inches in a height of 100 feet can readily occur and are not noticeable except when compared with a plumb line. Wind-bracing can be made of certain lengths to fit between the columns and requires that each column shall be in its proper place before the bracing will fit, so that no gross error can accumulate. Great care, however, must be used to see that the columns are vertical before the rivetting is done. The plumbing is usually done by means of heavy iron weights attached to wire. The plumb-bob is first steadied in a bucket of water.

The wind-bracing also performs an additional office of

THE CORBIN LIQUID DOOR CHECK & SPRING

(The Latest and Best from America).
It Prevents Banging, but Latches the Door.

Right Hand.

IS REPLACING OTHER CHECKS EVERYWHERE and is being Specified by Architects for Schools, Public Buildings & Private Homes.

BECAUSE

It is quicker and more positive in action, and draught to a minimum.
It never allows the door to bang.
Main Working Parts are Dust-Proof, and they never require Oiling or even cleaning.
Perfect regulation of Speed.
Absolute regularity of action.
The Liquid forming the check to the Spring is composed of ingredients not affected by extreme heat or cold.
Superior design, construction and appearance.
Patented everywhere.
Will work for years without attention.
Simple provision for taking up wear of joints in long use, again making the check as good as new.

Also Holders for Spring Doors & other purposes.

venting any movement of the building which cracks the plaster and eventually weakens the connections. In the Woman's Temple Building in Chicago, which is built with cast-iron columns, without wind-bracing of any sort, the movement of the building is perceptible and is sufficient to cause pictures suspended against the walls to describe an arc in oscillating.

Eccentric Loading of Columns.—In designing a building the equal spacing of the span of girders should be adhered to if possible. Sometimes the architectural treatment, if decided upon in advance, does not permit it, yet it can frequently be accomplished if the pros and cons are rationally considered. If the loading is equal on both sides of the column in either axis, then the column can be made of a minimum section, for no extra material has to be included to provide for the strain caused by bending. But if the plan or the elevation does not allow an equal spacing of the column, then the sectional area of the column must be increased or the radius of gyration must be increased, so that the increased strain caused by the bending of the unbalanced load does not increase the strain from the vertical loads beyond the unit strains allowed.

An eccentric load will increase the sectional area of the column materially, depending, of course, upon the load and the lever arm through which it acts. Where the columns are continuous or a splice is made between the ends of the abutting columns sufficient to transmit bending, the bending strains are reduced—because of the continuity of the column—by the force necessary to make a contrary flexure, and such a reduction in the strain is justifiable under ordinary conditions. The only condition such a consideration requires is that every alternate floor shall not be loaded, and every intervening floor be empty. This is not likely to occur at any time in any building except a warehouse, where such loading might occur.

Good design will eliminate many of the evils of eccentric loading. In many instances the wall beams can be placed on the outer side of the column, balancing, or nearly balancing, the interior girder load at right-angles.

Long and Short Spans v. Spans of Uniform Length.—It is advisable always to make the column spaces uniform along the line of girders, so that the girders can be of the same depth and of minimum section. The following example will show the economy of the uniform span of girders compared with long and short spans alternating:—

Take a building having a width of three spans of 16 feet each, the rows of columns being 16 feet on centres, and assume

the gross floor load at 140 lbs. per square foot. The load on each girder will be $16 \times 16 \times 140 = 35,840$ lbs. At a 16,000-lbs. fibre strain a 15-inch 42-lbs. I-beam at 16 feet span will carry 39,270 lbs. or more than enough. But, taking this weight, the metal required for the girders in these three spans will be $3 \times 16 \times 42 = 2,016$ lbs. Now, compare the distance of 48 feet divided, say, into two spans of 20 feet each and one span of 8 feet, as might be required under possible circumstances for a corridor. The load on the long girders will be $20 \times 16 \times 140 = 44,800$ lbs. A 15-inch 65-lbs. beam will carry 45,230 lbs., a little more than enough. The short span will be $8 \times 16 \times 140 = 17,920$ lbs. An 8-inch 17 75-lbs. beam will carry 18,960 lbs., which is a trifle over our needs, but it will answer. The total weight of metal required will be $(2 \times 20 \times 65) + (8 \times 17 75) = 2,742$ lbs., or an excess over the spans of uniform length of 726 lbs., or 36 per cent.

Open v. Closed Column Section.—The practice in bridge work has always been to require that the members of the truss be open, and not to be of a box or tubular form. The open form was required because of the necessity of frequent repainting, and, because of this necessity, the most economical disposition of the metal was often sacrificed. The same requirement is now being applied to buildings, not on account of the repainting, which can never be done, but because the protective covering can usually be applied in a better manner and the work can be inspected while this is being done.

The principal objection to the closed section is that it permits the accumulation of chippings, rivet heads and debris of all kinds during erection, and these, with the water which is likely to get in, will produce rust. In some instances the closed section is the most economical, and is the best structurally, but the liability to rust outweighs its advantages. In other instances, however, where the loads are great and the space to be occupied by the column is limited, a closed section is the only one which can be used. Where this is the case the interiors of the columns should be filled with concrete before the section above is put in place, particularly if the column is in the outside wall. The erectors of the ironwork will probably object to this because it will delay their work, but their protest should not be allowed to interfere with this necessary precaution. Haste is a good thing under certain conditions, but permanence should not be sacrificed to haste. The specification requiring this, however, should be clearly set forth not only under the particular heading but under the ironwork as well.

A BUILDER'S ACCIDENT.

A WORKMAN named William Painter had a miraculous escape from serious injury, if not death, last week whilst at work on some new buildings which are being erected in Tanner Street, Northampton, for the Northampton Gas Company. The framework of a new gasholder was in course of completion, and Painter, a skilled labourer, lodging at 23 St. Lawrence's Street, Northampton, was at work at the top of the structure. He had erected a stage of planks, and he was assisting to plate the top of the large gasholder, when the supporting plank suddenly broke. Painter was precipitated to the ground below, a distance of 23 feet. Fortunately he fell upon his feet, and as the surface of the ground was composed of sand the effects of the fall were considerably lessened. As he was falling he caught a projecting plank running from the ground to half-way up the structure, and by doing this he was able to break his fall. Singularly enough, when the staging broke at the top of the framework a large steel plate, 8 feet long and weighing 3 cwt., was also loosened from its place and, with the planking, fell immediately after Painter. Fortunately, just as he reached the ground the plate swerved on one side, and fell within inches only of Painter, who had a miraculous escape from being cut to pieces. The planks also fell clear of him, and all the damage he sustained were bruises about the body, on the thigh and ribs. His escape was a marvellous one. Had he fallen about 3 or 4 yards away, where the floor was of concrete, he would have been instantly killed. Another singular incident in connection with the accident was that although there was no one on the staging at the time it broke, only a few minutes before three men were working upon it, but had for some reason or other left that part of the scaffolding. Painter, who is twenty-three years of age, and whose home is at 34 Leicester Street, Kettering, was taken to the Northampton Infirmary and detained.

GERMAN PUMICE-STONE BRICKS.

ONE of the most interesting among the many industries located along the river Rhine and one which is unique, writes Mr. C. E. Carpenter in the *Canadian Architect*, is the manufacture of brick from pumice-stone, which is carried on in what is known as the Neuwied district. This district takes in the country on both sides of the Rhine between Coblenz and Andernach, a

distance of between 30 and 40 miles as the crow flies. On the left bank of the historic river, and right in the heart of the Neuwied, are the Eifelberg, a low range of gray, rock-clad mountains, which in former days, many centuries ago, spread their volcanic eruptions periodically over the entire surrounding district.

To these long-silenced volcanoes the people of the so-called Bimssand district owe their present unique industry and consequent industrial prosperity. It seems that the huge volumes of sand belched forth by the ancient craters had, with the passage of centuries, gradually disappeared beneath the soil, forming a sub-strata several feet below the surface. In many places, however, the layer of strata refused to disappear and yet not until quite recently did the scheme of utilising these valuable deposits present itself to the inhabitants of Neuwied. Even the practical Romans, whose régime along the left bank of the Rhine dates back scarcely more than four centuries, somehow failed to recognise the value of the stone for building purposes. It is also strange, but true, that Caesar and his successors, who threw up at this point on the river vast breastworks and other fortifications, did not realise the unlimited quantities of building material at their very doors. In fact the deposits have remained intact down to the present day.

The formation of the alluvial strata, several feet below the surface, is decidedly curious. Mineralogically, it is a foamy porous substance, reaching in many places a depth of 17 feet while in other localities its thickness is not more than a handbreadth. Equally simple as its formation is the method of removing it adopted by the miners. This consists of nothing more than clearing away the soil and piling the sand in long hills, from which it is shovelled direct into the mixing bed of water and lime close at hand. The pumice comes out of the earth in pieces, varying in size from mere grains to lumps some 4 inches across. It occurs in layers, but is frequently interrupted by small cuticular patches of more solid fragments of lava.

Before moulding the pumice is screened, the larger pieces being broken to pass through a sieve having $\frac{1}{2}$ -inch meshes. These screened pieces are then covered by a thin coating of cement, and the brick is moulded. The cement is not mixed with the pumice so as to form solid cement blocks, but by the fragments being coated first. The brick is then obtained by these coatings adhering to one another.

An idea of the quantity of ingredients necessary in the mixture may be gathered from the fact that for the manu-

147 STRAND, LONDON, W.C. (FIRST FLOOR)

factory of 20,000 bricks about 4½ tons of lime are required. After the mixing process the substance is poured into iron moulds provided with bottoms of detachable boards, which, after the removal of the moulds, act as driers. When the brick has been exposed to the air for a very short time they are ready for shipment.

As may be seen, the process of manufacture is simplicity itself. No modern machinery whatever is needed, and therefore none is used. An industrious workman averages from 300 to 1,800 bricks per diem, for which he receives the "magnificent" remuneration of 5 marks (about 5s.), and the working days are confined to the months between April and October.

The total production of Neuwied amounts to about 250,000,000 bricks. It gives employment to a small army of labourers, the most of whom are natives of the small villages of the "Westerwald" and the "Eifel." During the "campaign" these people practically live at their employment, in quarters furnished by their employers. The strictest sanitary precautions being required by the authorities, the season's work is in reality one long outing in the open air. In addition thrift is encouraged, prosperity is everywhere noticeable, and, altogether, the natives of the "land of pumice stone" are a happy and contented lot.

CONCRETE FOR FOUNDATIONS.

THE American Association of Railway Superintendents of Bridges and Buildings have published an important report on the use of concrete for foundations, culverts, bridge-piers, abutments and arches. In general, the opinion of the railway-bridge engineers decidedly favours Portland cement for concrete in place of natural cement. Not many years since American engineers, in view of the troubles which frequently followed the swelling or cracking of Portland cement as manufactured at that time, preferred for permanent work the natural cements; but the best Portland cement of the present day is, they remark, a very different material from that of ten or fifteen years ago, and work executed with it can be relied upon to a degree formerly unknown. Some of the contributors to the report point out that nothing but the best imported cement is satisfactory for concrete. The cost of Portland cement concrete for railway work seems to be now about the same everywhere in the United States, making allowance for local variations in cost of stone and sand, ranging

from 28s. 6d. to 35s. sterling per cubic yard, with an average perhaps of about 32s. 6d., and there seems to be little difference in cost between hand and machine-mixing, the former being cheaper for small work, and the latter for large on a large scale. In regard to quality, the railroad engineers find no practical difference between the hand-mixed and machine-mixed concrete, the machine-mixing being perhaps a little more regular, but any carelessness in machine-mixing involves worse consequences than in hand-mixing. As between wet and dry concrete, meaning by the latter a concrete on which water can be brought to the surface only by heavy ramming, the railway engineers prefer a moderately dry material, such as will not quake under the rammer, but on which water will show after a few minutes' tramping. Concerning concretework in freezing weather, again, the practice of the engineers does not quite support the theories. It is often averred that freezing does not injure Portland cement concrete, but nearly all the railway engineers prefer not to do concretework when the thermometer is below 20 deg. Fahr. In any case, they find it much more expensive in cold weather, and even when the sand and water are heated the concrete is unsatisfactory, inclining to crumble on the surface.

DRURY LANE THEATRE.

At a meeting of the shareholders of the Theatre Royal, Drury Lane, Lord G. H. Loftus presided. As to the alterations to the theatre, he said that the company had been in the past continually troubled by the London County Council. So soon as one requirement was complied with another was promptly put forward, in some cases involving the undoing of former work. Complaints had also been received of the heat in the circles and the cold draughts in the stalls and other matters. The board felt that when the alterations now being made were finished the company would have a theatre as perfect as any in the United Kingdom. The improvements which were now approaching completion would cost about 10,000l. These, however, included a number of alterations in excess of those required by the County Council, and the effect of which would be to considerably increase the earning power of the company. For example, the ventilation would be perfect, the stalls had been rearranged so as to give more room and better ingress and egress, and the uncomfortable boxes on the ground-floor had been removed and stalls substituted. The grand and first circles had also been extended so as to hold 200 more seats,

the boxes on the same tiers had been greatly improved, and he felt sure that their patrons in every part of the house would find it more comfortable than it was before. He believed, moreover, that the board had finally satisfied the requirements of the County Council. The whole of the improvements which were now being made, as well as the past improvements, including the erection of the shops and flats, would, there was every reason to anticipate, be provided for without calling up any part of the 5s. per share still remaining unpaid on the shares.

AUSTRALIAN AND OTHER HARDWOODS.

THE Agent-General for New South Wales, Mr. Henry Copeland, has sent the following letter to the *Times* :—

As a resident in Australia for the last forty-five years, I have been much interested, and to some extent amused, by the controversy in your columns as to the relative value of the American timber in comparison to the Australian hardwoods for street paving.

It would appear from the correspondence referred to that America is sending over here a wood designated "red gum." Now I wish to say at once that I lay no claim to botanical science, and only wish to pose as an Australian bushman, having spent some happy years of my early life in the Australian forests as a splitter of rails, palings and shingles, and thereby acquired some practical knowledge of our Australian timber trees; but from my casual readings I was led to believe that Australia virtually possessed a monopoly of the gum tree. The various groups of the eucalyptus were supposed to have their habitat in Australia and the adjacent islands, known generally as Australasia. To my surprise, however, I now learn that America is exporting a red gum timber for pavement purposes, and my natural curiosity prompts me to inquire from your correspondents where is this "red gum" grown in America. I know that many years ago a large number of seeds or plants of the various forms of the eucalypti were exported from Australia to California; but I can hardly imagine that in one man's lifetime these transplantations have developed to the extent to admit of exportation on a large scale, and I naturally wonder whether the cute American, knowing the reputation which the Australian red gum has attained in England and other European countries, has ventured on doing a little commercial

piracy on our unique Australian botanical nomenclature. We have all heard the story of American wooden nutmegs, and I am inquisitive enough to wonder whether this article of commerce was manufactured from the American red gum timber.

I am under the impression that Australia possesses a virtual monopoly of abundant hardwood timber in suitable localities to enable them to compete with the whole world for the most serviceable and durable wood pavement; and, such being undoubtedly the case, it would appear to me a misfortune if any less durable wood were laid down in Westminster or elsewhere, inasmuch as wood pavement in the United Kingdom is as yet only in the experimental stage. Let me assure your readers that in New South Wales we have immense virgin forests, virtually untapped as yet, of hardwood timber trees within an accessible distance of our various shipping ports—trees ranging from, say, 6 feet in diameter at their base, running up to 250 feet in height; while the larger forests contain numerous glades of arboriferous giants with a modest girth of from 24 to 36 feet and an altitude of from 300 to 400 feet, while they are as straight as a billiard cue. Amongst the former may be mentioned the blue and grey gum, the iron-bark, the red gum and the flooded gum; these, however, are generally used locally for railway sleepers and house girders, but the larger and more abundant forest trees suitable for export for street pavement include the mountain ash, tallow-wood, blackbutt, box, woollybutt, mahogany, turpentine, spotted gum, messmate and stringy-bark. I have personally examined many logs of these trees, which have lain on the ground to my certain knowledge for from twenty to thirty years, and they were as sound as on the day they were felled—close-grained and almost as hard as iron. I have seen other logs, notably of iron-bark, which have been immersed in sea water for thirty or forty years, brought to daylight as sound as on the day they were immersed, barring some very slight signs of the *teredo* on the outer surfaces. Samples of these timbers can be seen at this office, as well as at the Imperial Institute and the Royal Gardens, Kew.

Why then, may I ask, should the corporations of the British Empire go outside the Empire for wood pavement or which the residents of the Empire have to walk or drive? Many of your people can never hope to tread the forests of Australia, but they may at least be enabled to wend their way to their offices and homes by placing their solid British feet on the blocks of the health-giving and microbe-destroying eucalyptus giants of the Australian forests.

The Architect.

THE WEEK.

THE Irish Local Government Board must be hypercritical, and therefore difficult to please. Four times plans for artisans' cottages at Ennis, co. Clare, a town where the streets are very narrow, have been sent to the Board for approval, and four times they have been rejected. On the last occasion the estimated cost of 148% per cottage was declared to be too high. The plans were all prepared by the surveyor to the Urban Council, in accordance with the official instructions. The Local Government Board recommended that before advertising for tenders the Council should submit the plans to a consulting engineer, and obtain from him a report as to what modifications and additions were necessary, so as to secure comfortable dwellings at a moderate cost and avoid all uncertainty and dispute in connection with contracts. They further suggested that the Council might ask to be allowed to inspect the satisfactory plans recently approved in Limerick. No objection could be raised to the refusal of the Local Government Board to approve of plans from Ennis, but to ask the Council to seek in a rival town for models was more than any inhabitant of Ennis could be expected to endure. The surveyor accordingly said he would abandon all connection with the scheme, for no matter what plans he prepared they were rejected, while whatever was sent from other Councils was accepted. After a long and angry discussion it was decided by a majority of one to inspect the Limerick plans.

HASTINGS, as one of the Cinque Ports, has a history, and an immense quantity of documents relating to it exist. Some are in the Hastings Museum, others in the British Museum and the Record Office; but those which are regarded as most interesting belong to private owners. The late Mr. THOMAS ROSS, who was five times mayor of the borough, had accumulated many manuscripts which go back as far as A.D. 1433. These have been placed in the hands of Mr. CHARLES DAWSON, F.S.A., the keeper of the historical manuscripts in the Hastings Museum. Like many others of the class, the manuscripts are in archaic handwriting, and mostly in old and abbreviated Latin and French, and are undecipherable to the majority of those who see them. Mr. DAWSON now proposes that if the Corporation will pay for the cost of printing the records, he will undertake to provide gratuitously the translation into plain English, collation, and the general editorial work connected with the publications. The documents would be arranged in order of date, and would be connected with a running text translated from the contemporary chronicles of England, and other results of archaeological research would be introduced under their relative dates. The work can be commenced without delay, so as to be useful to the town at the time when its liberties and that of the Cinque Ports generally stand in need of real historical evidence, and expenses might be reduced by the sale of the book to those interested. Mr. DAWSON's generous offer is now under the consideration of the Corporation.

THE Italian architect Signor MAINONI D'INTIGNANO prepared for the Queen Dowager of ITALY a design for a casket which is to contain the coat of mail worn by her husband, the late King HUMBERT, on the day of his assassination, and which was perforated by the balls. The casket is now complete. It is Renaissance in style. Ebony is the principal material, and it is adorned with bas-reliefs and ornaments in silver. On the front are the arms of Savoy, with the initial letters "H. R." The angles bear the royal escutcheon with the device "Fert." On the cover is the inscription *XXIX. Julii, MDCCCC.* On the back of the casket is the following verse from the Book of Wisdom:—"Justorum animæ in manu Dei sunt, et non tanget illos tormentum mortis." The inside is lined with red velvet, on which are embroidered the letters "H. R." alternately with marguerites. The casket is surmounted by the cross of Savoy, with a garland of flowers and ribbons.

THE two premiums of 25 guineas for the somewhat extensive additions and alterations to the workhouse of the Hereford Union have been awarded to Mr. E. H. LINGEN BARKER, of Hereford, and to Messrs. WILLS & ANDERSON, of Swansea. The other competitors were Mr. ARTHUR MARSHALL, of Nottingham; Mr. R. I. McBEATH, of Manchester; and Mr. S. H. EACHUS, of Wolverhampton. The schemes embraced a new administrative block and an infirmary for 100 patients.

THERE can be no question about the age of Langres, a town near Chaumont, in the east of France, for it has been mentioned by JULIUS CÆSAR. In the time of LOUIS PHILIPPE it was believed to have strategic importance, and large sums were expended on fortifying it. It is now proposed to remove some of the defensive works. One effect will be that the great gate erected by the Romans in A.D. 301 as a memorial of a victory over German tribes will be once more brought into prominence. In character it resembles the gates at Rheims and Autun. There are two arches which are flanked by Corinthian pilasters. The gateway is situated in the east of the city, and as ramparts are not remarkable for their beauty this important structure is generally neglected by visitors to the town, for it seems to be no more than a part of the fortifications. The preservation of the gate will be the work of officials, and will add new interest to the town which was the birthplace of DIDEROT.

ONE of those American educational expeditions that in pursuit of knowledge visit remote regions has been fortunate in discovering a remarkable example of mosaic at Serdjilla, in the district Djebel-Ritra of Syria. It formed part of the Roman baths which, according to an inscription, were erected by JULIANUS and his wife DOMNA in 473 A.D. The mosaic measures about 50 feet by 26 feet. The inscription is in the centre, and is arranged in a circular form. Around it are several animal scenes, and as the colours have been preserved by the sand of the desert they are still unusually brilliant. The landscape is symbolised by a pomegranate tree, of which the branches are spread out. The trunk and branches are formed of black tesserae. The fruit is red, with a white light on each to increase the effect. Among the animals introduced are a tiger with a gazelle upon its back, a lion that tears a wild ass, a bear that follows his prey, a leopard, &c. All are skilfully represented. Here and there water-birds are introduced in the intermediary spaces. Photographs have been taken of the mosaic.

AMERICANS have shown so much intrepidity in competing in this country with English products, we cannot be surprised when we hear of arrangements for the exportation of granite from Maine in order to supplant the supplies which have been so long derived from Aberdeen. But the Americans calculate there is a chance to make money by underselling the Scottish stone, which has upheld its reputation during a vast number of years, and that prospect is enough to inspire their enterprise. It is not asserted that American granite is stronger or of a better colour; all that is proposed to be demonstrated is that it can be supplied at a lower price. A voyage across the Atlantic is less expensive than a railway journey from the North of Scotland or a coasting trip from the inexhaustible quarries in the West of Ireland. It is assumed that Aberdeen blocks under 40 cubic feet in size sell for 1 dol. 15 cents to 1 dol. 25 cents a foot, while sizes above this command 2 dols. 25 cents a cubic foot. The American projectors calculate that they can deliver the large-size blocks in Glasgow, Aberdeen or Liverpool at 1 dol. per foot. The margin for contingencies might still be wide and yet leave a handsome profit on every transaction. American stone has been already used in various parts of Great Britain, as well as Swedish and Russian and other foreign granites, and having gained a footing it is allowable for the Americans to indulge in visions of success in the stone trade. Not only is the exportation of granite contemplated, but other building stones are prepared to be also despatched.

DUALITY OF EGYPTIAN ART.

SO much is known about ancient Egypt and the life of its inhabitants, we may be supposed to stand in need of no further information. Every year, however, there are surprises for those who consider they are acquainted with the former condition of the country. More desirable than many material discoveries would be a few statistics about the people. If we could ascertain the number of artists who lived in Egypt at particular times we should then have a clue to circumstances which are not sufficiently illuminated.

The myriad examples of Egyptian art, using that word to express everything from a temple to a tablet, and from a statue to a spoon, have become so familiar of late, we do not sufficiently realise the reasons through which productiveness became so general. The discoveries of recent years are sufficient to give the impression that as a treasury of remains Egypt is inexhaustible. On the other hand, we should bear in mind that collectors in the form of thieves have been at work from a remote age. There is evidence that the ancient Egyptians were not more deterred by the sanctity of tombs than any of the Greek dealers we encounter, but abstracted what was most precious and most portable in them soon after their closure. Indeed, the robbery of tombs has never ceased. If we compare Egypt with any other country, its peculiar wealth will then be more clearly understood. No eastern nation, such as Assyria, Persia, Phœnicia, has yielded so much, nor can we believe that in spite of their natural ability the Greek artists were ever as busy as those of Egypt. For it must be understood that the relics of the life of the old Egyptians are mainly works of art.

What were the causes which made Egypt distinguished by its demand for those works, and in that way gained for its dusky people an immortality of a kind which never entered into their thoughts? A continuous series of existences, and sometimes under different conditions, was generally believed in by the Egyptians, but so far as can be discovered from any of their inscriptions or from their literary compositions, it was not imagined that a time would come when people in remote regions of the earth would regard the subjects of the PHARAOKS with almost as much interest as if they were living contemporaries. Visions of that kind never passed before the minds of Egyptian scribes, and if the artists sought to conquer time it was for a different purpose.

It is evident from the character of many of the objects which have come down to us that wealthy Egyptians endeavoured to surround themselves with things of beauty, and which truly were to be joys for ever. When we find a box to hold perfumes taking the form of a water nymph holding a duck or a water plant, all being made of gold or some precious metal, it is safe to conclude that the toilet services of Egyptian ladies could not always have been composed of articles which were purchased cheaply. The jewellery, of which there are so many examples, will sustain the scrutiny of modern experts. The enamelling was delicate in outline and charming in colour. The forms of the furniture were graceful. The locks and bolts appear to have been made symbolic by the introduction of figures of lions. The diadems, bracelets, chains and rings could hardly be surpassed by Parisian jewellers. A battle-axe or hatchet which is now in the Gizeh Museum would be sufficient if no other work had survived to reveal to us the elevation which was reached by the metalworkers. The handle, which is of cedar and gold, is covered with hieroglyphics, and adorned with precious stones such as turquoises, cornelians, lapis-lazuli, &c. The blade, made of bronze, but crusted with gold, has a different adornment on each face. On one bouquets of lotus appear, the colours being heightened by stones which are beautiful and of extreme hardness. On the other an enamel is used which is so close in grain it appears to be part of a large mineral; on it is a figure of a king, who is represented in the familiar attitude of seizing his enemies by the hair prior to decapitating them. Below him is a symbolical figure of a griffin with an eagle's head, which typifies the impetuous courage of the warrior. Many arms are to be found which are equally serviceable and gorgeous. When we see so much artistic grandeur introduced in weapons for the

slaughter of barbarians, we can infer to what extent beauty was sought after in Egypt.

It must, however, be allowed that if the remains of Egyptian art were restricted to objects which were intended for everyday use in this world, archaeological collections would be reduced to a remarkable extent. They would only reveal to us one aspect as it were of ancient life. But there was a duality among the Egyptians which was carried out more comprehensively than by people who adopted similar views of a future life. With the Egyptians not only the immortality of the soul was accepted as a doctrine, but the immortality of the body as well. Different races in different times have endeavoured to make provision for futurity, but the Egyptians alone appear to have believed and to have acted on the belief that the patronage of artists was essential for all who wished to enjoy felicity after they quitted the land of Egypt. The multiplicity of Egyptian works of art was therefore indispensable, because they ministered not only to a visible state of existence, but also to one which was veiled to most eyes. "The undiscovered country from whose bourne no traveller returns" was not recognised by any orthodox Egyptian. The travellers he was assured came back. Affection might in some cases dictate that provision should be made for their relatives' needs when revisiting the Nile Valley, but every prudent Egyptian took care to be independent of the memories of his children and friends. He made preparations for the reappearances to which he was destined. Thus we sometimes see representations of model men engaged in arrangements for the approaching stages of their mutable condition, or they display their satisfaction when receiving the offerings of their relatives or look upon the memorials which had been prepared out of gratitude for former kindness. Many of the things that were prized by an Egyptian were carried to his or her tomb. In that way death lost some of its terror. There is a pathetic story about Cardinal MAZARIN rising painfully from his death-bed to gaze on his pictures and lamenting his impending separation from them. An Egyptian functionary under like circumstances would be able to feel that his treasures were to remain as his companions, and there was a long time before him during which he could enjoy them.

The priests were quite willing to enter into contracts, by which in return for lands or other property they arranged to offer sacrifices to a man in his new state of existence. It used to be imagined that the priests dominated the artists when executing their works, that the original draft of every work of art, whether painting or sculpture, was prepared by them, and that artists were not allowed to depart from the proportions and treatment. That view is not now taken as universal, for there are enough signs of liberty in the labours of the painters and sculptors. But as auxiliaries in making the future life agreeable to wealthy or influential persons, it is likely the artists were in subjection to the priests.

The kings were, of course, able to erect temples which they believed would help to insure their happiness hereafter. The mighty RAMESES II., when in a state of dejection, made an appeal to the god AMEN on that account. "Have I not," he exclaimed, "made for thee many and great buildings of stone, have I not filled thy temples with my spoils, building for thee a temple to last myriads of years? I have built thee a house of great stones, erecting for thee eternal groves; I have brought for thee obelisks from Abou, I have caused the everlasting stones to be fetched, launching for thee boats upon the sea, importing for thee the manufactures of the lands. When was it ever before said that such a thing was done?" It is remarkable how conscious the Egyptians were of the prevailing character of their architecture. It was not merely the custom of the country to make temples on a massive scale, they wished to make them irresistible to time. Thus a king, according to one of the papyri, says:—"I built a house adorned with gold, its roof and walls with lapis-lazuli, the floors were made of stone and metal, the hinges were of bronze, its structure made for eternity, everlasting are its exhortations."

It was not possible for inferior people to offer temples, but they wished to reveal their good-will by having models of parts of temples in their tombs. It is believed that in connection with every large temple there was a monolithic chapel, wherein the god to whom the building was dedicated

resided, but in which human eyes could at least see either a symbol of the god or the animal that was especially dedicated to him. It is not uncommon to find models of such shrines in tombs. Sometimes a chapel of the kind was formed in the tomb, and in it was placed a statue of the deceased person, for curiously in Egypt mortals were not afraid to assume the privileges conferred by religion on the gods. Statues exercised an important function in the ritual of the dead. A statue became a double, as it were, of the occupant of the tomb; it was subjected to hieratic dedication, and then it was fancied to be transformed and became representative in another sense. It therefore ceased to be an image of stone. The images were credited with being able to respond in some way for the man or woman they resembled whenever called upon. On that account the words of a prayer were often engraved upon them which they were supposed to express. As it was considered that a figure might for one reason or another be sometimes unable to answer promptly to the call of a god, several supplementary statuettes were introduced, according to the wealth of the occupant of the tomb. The earliest examples are in wood, granite, limestone or alabaster, but at a later time terra-cotta figures covered with a blue enamel were adopted. These figurines either represented the deceased man or woman, or suggested them, in altered conditions of life; for example, a man who in this life was not a labourer is sometimes shown carrying a spade or a bag with seed. Those who cast statuettes into the cemetery at Tanagra were, as often happened with the Greeks, merely following Egyptian precedents.

In a more remote period, say 6,000 years ago, the memorials of the dead were fashioned so as to resemble an ordinary Egyptian house. The principal feature in such cases was the door. It was imagined that the tenant of the tomb could pass out in that way, and consequently the offerings which were needed for his sustenance were placed before it. Probably in deference to sceptics the offerings were afterwards represented upon the door. It was, however, accepted that in their new form they were equally nourishing to the dead. Then instead of a doorway a table was introduced bearing an inscription in the form of a prayer to the guardian deity, that the food should be allowed to reach the being for whom it was brought. The extraordinary spectacle was thus presented of stone figures which at times were supposed to become animated and were able to enjoy and digest provisions made of similar stone. Instead of full-sized figures, in course of time statuettes, as we have said, were substituted. So much credulity may now appear pitiful, but in everything relating to symbolism it is easy to misinterpret what we see. KINGLAKE warns travellers to refrain from mocking the Sphinx, and the advice should be accepted by all who visit an archaeological collection which is representative of Egypt.

The ritual of the dead not only enabled an army of artists to be constantly engaged, but afforded opportunities for the utmost variety in their works. The examples which were introduced in museums in the eighteenth and nineteenth centuries were at first principally figures in rigid attitudes. It was only natural the conclusion should be drawn that the art was limited in its range, and the treatment must be as stiff as if only basalt or porphyry were to be used. It is now found that the Egyptians did not differ in their mental organisation from other varieties of human kind. The fragments which we possess have revealed that they were endowed with a marvellous imagination. There is nothing in the "Arabian Nights" to surpass in unrestrained wildness the "Tale of the Two Brothers," ANEPOU and SATOU, which is the subject of the Orbiney Papyrus in the British Museum. Once allow that such power existed and was tolerated, we may expect variety in all the arts; and an Egyptian museum which professes to be representative cannot fail to be marked by the diversity of its contents. We find puppets as well as colossi, and with the stupendous examples of architecture before their eyes the Egyptian craftsmen were courageous enough to create small models of houses which in execution are equal to any of those imported from the Black Forest, while their interest is immeasurable. Outlying farm-buildings are to be seen in museums which are worth volumes from the light they cast on the life of the people. The necessity of filling some of the

tombs with objects compelled the craftsmen to become most dexterous in manipulation, and, indeed, there are toys in the form of animals and little figures of men and women that might be taken to be the work of Japanese fingers. Life in an Egyptian house must have been very different from the sepulchral coldness which the Egyptian Room in the British Museum suggests. In fact, recent discoveries compel us to believe that TH. GAUTIER, when he wrote his "Romance of a Mummy," with the aid of ERNEST FEYDEAU'S lore, was only painting a picture in monochrome instead of using startling colours as was supposed.

The prehistoric period in Egypt, according to Professor FLINDERS PETRIE, began about 7,000 years ago. At that time vase-painting was known. Then followed the carving of animals on slabs of slate, and the representation of them on the heads of combs. As well as can be ascertained, through all the dynasties down to the Roman invasion art was prized by the people, but it does not appear that any artist rose to power in Egypt. The caste system was recognised, although it may not have been a part of the constitution of the country. In the remarkable letters from and to a scribe, known as the Sallier Papyri, which are also in the British Museum, we find that the scribe's position is proved to be superior to that of the artist's. He could be sent upon important commissions, or employed in political affairs. The metalworker, on the contrary, was compelled to stand at the mouth of a furnace, his fingers being like the claws of a crocodile when he hunted after the eggs of fishes. The builder was not released from work at night, but had to continue it by the light of a candle. The sculptor and other "sons of stone" had to labour until they were weary, and when they sat down to a meal their knees and backs were fatigued. It cannot be said that ancient Egypt was an exception, and that sculptors, builders and metalworkers have always received the rewards to which they believed themselves entitled. The status of the Egyptian artist would, however, be too vast a subject to be dealt with incidentally. All that we have wished to show is that there was a wider field for artistic labour in Egypt than in any other country, and that the demand for the services of artists arose because, unlike the custom in most other countries, ancient or modern, they had to gratify not only the living, but, as was supposed, the departed Egyptians also.

POOR-LAW BUILDINGS.*

AMONG the reforms which are credited to CHARLES DICKENS as the initiator is that of the Poor-Law System. The abuses of the Poor Laws were recognised before the appearance of "Oliver Twist," but that novel revealed some of the evils which were practised prior to the passing of the Amendment Act of 1834. A parochial basis had been adopted throughout England, and it was represented not only by Mr. BUMBLE and the lady to whom he sold himself so cheaply, but by dangers to society, of which probably the worst was the bringing up of young rascals like NOAH CLAYPOLE. But DICKENS'S workhouse was only one of many expedients to abate an evil without having a proper diagnosis of its character. There is the highest authority for the belief that the poor are to be always with us, but for some centuries in England beggary was treated after the manner of sewage, or, in other words, so long as it was kept out of sight it mattered little what were the consequences. For the crowds of sturdy beggars that arose in England after the dissolution of the monasteries, whipping, ear-cropping and finally hanging were the only remedies which could be devised by the Tudor Parliament. But disagreeable as was the sight of the wandering wretches, the English people had not the heart to carry out the Act of HENRY VIII. In the next reign slavery was adopted as a less severe remedy, but that experiment was also looked upon as a failure. There was

* *Hints and Suggestions as to the Planning of Poor-Law Buildings*, including some recommendations as to the arrangement and construction of separate accommodation for the children of the indoor poor, and some remarks upon the accommodation that may have to be provided for the imbecile and idiot poor, as well as for the epileptics at present in the extra-metropolitan workhouses. By Percival Gordon Smith, late Architect to the Local Government Board. (London: Knight & Co.)

a revival of the punishments of whipping, burning the gristle of the ear, and hanging without benefit of clergy for beggars in the time of ELIZABETH. But by a subsequent Act the penalties were not to be inflicted on any man until he refused to work for ordinary wages. Whatever might be done with fathers and mothers, the children remained as a difficulty, and it could not be ignored that people existed who were too old to work and were not strong enough to endure the legal tortures. To provide for such cases the parish was adopted as a unit of collection, simply because there were local authorities in existence, and it was not necessary to create new officials. Churchwardens and overseers were therefore authorised to build poor-houses at the charge of the parish. They could also bind as apprentices any children brought up in them in order to lighten the parishioners' burdens. The arrangement continued until 1834, and its last development was described in the pages of "Oliver Twist." That unhappy hero of the novel was, in fact, bound as a parish apprentice.

By the Poor Law Amendment Act of 1834 commissioners were appointed with authority over all England. As the parochial system was a failure the commissioners were empowered to unite several parishes in order to form an union, which was to be administered by guardians instead of churchwardens and overseers. One effect of the change was the promotion of economy. In 1832 a sum of over seven millions had been expended in the relief of the poor, while in 1837 the cost had fallen to four millions. Among the reasons given for the decrease was that farm labourers used to be chargeable to the parishes when out of work, and the farmers could therefore dismiss them whenever they liked, and compel their neighbours to aid in supporting the men. Under the new Act assistance was not to be obtained unless applicants entered the workhouse as paupers, and as the labourers rebelled against the degradation farmers were obliged to find employment for the men throughout the year. In that way the new workhouses insured economy.

In Ireland there was no legal provision for the relief of the poor prior to 1838. There was a more crying demand for organisation in that country than in England. It became necessary to divide the country into unions, and in each of them to erect a large workhouse. An official architect, the late GEORGE WILKINSON, an Englishman, was appointed, and in the buildings which he designed we see the first systematic attempt to erect a workhouse which would correspond with a theory. The buildings, which are of an Elizabethan type, are known to all tourists, and in many districts they were so superior to the hovels of the peasantry, they became known as "Paupers' Palaces." The order and comfort were so novel to the inmates, the buildings were demoralising, for they became permanent residences for strong men and women; but the expenses were in course of time found to be out of proportion to the resources of many of the unions. After the failure of the potato crop, the elected guardians were unable to cope with the increased destitution on account of its expense, and the Government found it necessary to supplant them by paid guardians, who had no concern about the additional expenses. Never were buildings so tested, for in some of them were as many as 600 patients stricken by famine-fever.

It is not possible to plan buildings rightly, whatever may be their character, unless there is a definite idea of the purposes they are to subserve. Even in 1834 terror was recognised as a necessity when dealing with poverty, and a tradition of the old floggings, burnings and hangings was not without effect on poor-law officials and their architects. This is suggested by a passage in Mr. P. G. SMITH'S Introduction. He says:—

The workhouses were purposely made as deterrent as possible, in order that every poor person should be relieved with the bare necessities of life, while at the same time discouraged from resorting to these institutions as a means of living an idle existence at the cost of the ratepayers. It was one of the main objects of the system to discourage dependence upon the rates and to promote self-support and independence. That the new Poor Laws have been a complete success is now beyond doubt, though the same class of able-bodied paupers that existed in those days may perhaps be said to still exist in vastly diminished numbers in the shape of the tramp; but even these might still be further diminished, if not actually exterminated, if the regulations relating to them were uniformly and rigorously enforced, and if beggary were discouraged or

dealt with energetically by the police. It is astonishing how the number of vagrants applying for admission at the workhouses has been diminished where the regulations entrusted to Boards of Guardians have been judiciously and energetically applied, where separate cells are used and detention for at least two nights, with a suitable task of work, have been rigidly enforced.

Mr. SMITH, whose experience must be unequalled, thinks that the workhouse is becoming a mere refuge for the aged, the infirm and the sick, and with this change there is corresponding diminution of reluctance on their part to enter it, while at the same time the public desire a more liberal and humane treatment of the inmates. This statement is enough to vouch for the fact that the old workhouses, with their deterring characteristics, are obsolete. In spite of all that occurs in present-day business to harden the hearts of men, it is manifest that pity is not yet extinct, and consequently we find the exterior of the modern workhouse presents an agreeable appearance, unlike its predecessor, which was so gloomy there was no need to inscribe on it DANTE'S words, "All hope abandon ye who enter here." The buildings we lately illustrated, which were erected by the Guardians of the Greenwich and the Steyning Unions, exemplify the newest system, and we have no doubt they answer their purpose as well as if they suggested that the pauper and the criminal were alike in the eyes of ratepayers and of officials. Exceptions are generally made between the accommodation provided for those who are compelled to remain in the workhouse wards for an indefinite period and the casuals who wish to regain their liberty out of doors after a short detention. For the latter the separate cell system has been advocated by Mr. SMITH, and indeed Mr. J. GREENWOOD'S narrative of his heroic captivity for a whole night in a casual ward should have accomplished long ago a transformation in the parts assigned to vagrants. But the greatest change is seen in the arrangements for children. Mr. SMITH tells us that, "In the case of new workhouses erected during the last few years, provision for children above the age of nurture has practically been wholly dispensed with, and the necessary accommodation for them has had to be found elsewhere than in connection with the workhouse. Even some of the large barrack schools which were provided thirty to fifty years ago have been abolished, and other accommodation has had to be provided for the children thus displaced." These remarks are additional proof of the necessity to provide buildings according to a new standard that will greatly differ from the one adopted some years ago.

In 1883 the Local Government Board issued a series of instructions about the arrangements of workhouses, entitled "Points to be attended to in the Construction of Workhouse Buildings." But in the course of eighteen years public as well as expert opinion has grown in favour of requirements which were then not anticipated. About one-third of Mr. SMITH'S book is occupied with an annotated edition of the points. In his notes we have the expression of the latest ideas on the subject of workhouses, and they form the most useful guide to architects which is obtainable. Mr. SMITH, it may be remarked, is not in favour of the competition system as a means of obtaining plans for workhouses. He advises that the first step should be the appointment of a qualified architect, whose reputation for integrity in the interests of his clients is recognised. He should be allowed to consult with the committee and such officers as can give him assistance. But whatever system is adopted for obtaining plans, Mr. SMITH'S volume cannot be overlooked, for in every page of it there is something suggestive as well as explanatory of official tendencies.

BEXLEY AND CRAYFORD, KENT.*

BEXLEY, in the hundred of Ruxley, is a place of remote antiquity; in this district are found many Celtic caves, which are described by Hasted as being on the heaths near Crayford, as in the fields and woods hereabout, some of which are ten, some fifteen and others twenty fathoms deep. They are described by Tacitus and other writers. The Roman Watling Street passes through Bexley Heath to Crayford.

* A paper read at Dartford on August 17, by Mr. William Frederick Potter, architect, before the members of the Upper Norwood Athenæum.

Camden says:—"In the year 457, Hengist, the first king of Kent, meeting with the Britons at Crecanford (now called Crayford), gave them battle, slew four of their chief commanders and 4,000 men, and gave them such a defeat that they entirely abandoned this county and fled with great fear towards London." Cenulph, King of Mercia, having made the kingdom of Kent tributary to him (according to Hasted) gave to Wilfrid, Archbishop of Canterbury, for the use of Christ Church in Canterbury, ten plough lands, viz. Bexley, A.D. 803. This continued in the possession of that see at the time of the Domesday Survey, and is therein described:—"The archbishop himself holds Bix (Bexley). It was taxed at three sulings

made over his right to the University of Oxford, and died November 11, 1623, on which the fee of this manor became vested in the University of Oxford by virtue of the deed of gift above mentioned.

The church mentioned in Domesday stands at the east end of the village, and is dedicated to St. Mary. It has a spire covered with shingles at the west end, in which hang five bells. This church was very anciently appropriated to the Priory of the Holy Trinity, London. In the second year of King Stephen, A.D., 1137, a bull was granted to this priory by Pope Innocent for its protection and the confirmation of all its possessions, among which Bexley is mentioned. This priory was dissolved

at the time of King Edward the Confessor, and now for two. There is a church and three mills. In the whole it was worth in the time of King Edward the Confessor, as well as afterwards, 12 pounds, and now 20 pounds, and yet it pays 30 pounds and 8 shillings."

Archbishop Walter Reynolds in the 9th of King Edward II., 1315, procured to himself and successors the grant of a market to be held weekly at Bexley. The manor remained part of the possession of the see of Canterbury till Archbishop Thomas Cranmer granted it in 1537 to Henry VIII. and his heirs and successors for ever. It continued vested in the Crown till it was granted by James I. in fee to Sir John Spilman, the king's jeweller, who soon afterwards conveyed it to Sir William Camden, Knt., the great antiquary. He

in the twenty-third year of King Henry VIII. and its revenues surrendered to that king. The church is a venerable fabric, and consists of a nave, chancel, side aisles and tower at west end. This church was restored in 1882 at a cost of nearly 4,000/. On the north side of chancel is a mural monument of Sir John Champneis, Lord Mayor of London, who died in 1556. On the south side is a mural monument to John Styleman, of London, who died in 1734, aged 82; he was the founder of the Bexley almshouses. There are also memorials to the Austin and other families, with several ancient brasses.

One brass records the family of At-hall, of Hall Place, and another is of Thomas Sparrow, 1513. In the churchyard is the tomb of Francis Moore the elder, the founder of "Old Moore's Almanac," with the curious error cut on the gravestone that

he died "March 31th, 1684," instead of 31st. This church was visited by the members of the Upper Norwood Athenæum, under the leadership of our late friend, Mr. E. S. Johnson, in 1886, and the account of our visit appears in our volume for that year. The river Cray flows northward through the middle of this village. It passes through the Crays, or the five villages of that name, viz. St. Mary's Cray, Paul's Cray, Foot's Cray, North Cray and Crayford. All these ancient villages are described in Domesday Book. North Cray Church has been recently rebuilt, and the old stained glass has been inserted in the north porch, and two old stone coffins have been placed externally on the south side. These seem to require protection.

Ruxley, in this parish, is a small hamlet, and was formerly a separate parish, the church being still in existence and now is used as a barn. This place gives name to the Hundred in which it is situated. Hasted says:—In the reign of King Richard I. North Cray was become part of the possession of a family who were seated in the adjoining parish of Rokesle, now called Ruxley, and assumed their surname from it. Malgerius de Rokesle was seated there at the time of the Domesday. His descendant, Sir John de Rokesle, accompanied King Richard I. to Palestine, and was present at the siege of Acon (or Acre) there with many others of the Kentish gentry. He died possessed of these estates, and from him

into the river Darent, near Dartford, when both continue their course and fall into the Thames near Greenhithe and Stone, opposite to Purfleet.

Hall Place.

Hall Place is an ancient mansion which stands in the northern part of the parish of Bexley, next Crayford. It was anciently the inheritance of a family who assumed their name from it, being called At-hall, the last of whom was Thomas At-hall, who in the reign of King Edward III., 1366, conveyed it to Thomas Shelle (or Shelley), of Gaysum, in Westerham, in whose family it continued down to John Shelley, who resided here and died possessed of it, November 22, 1441. His son, William Shelley, passed away this seat in 1537 to Sir John Champneis, Knt., who had among others his possessions in this county disengaged by the Act of 31st King Henry VIII. He resided at Hall Place, died in 1556, and lies buried in Bexley Church. It was afterwards long in the family of Austin; the last, Sir Robert Austin, Bart., died in 1772, when the title became extinct. A tile fixed in the garden wall has the date of 1313 moulded on it. The front of the mansion was rebuilt in the reign of Queen Elizabeth. Such are the meagre extracts from Hasted. This property has recently changed hands, and by the kindness of the lessee, Mrs. Pugh Cook, we are permitted to visit

they afterwards descended to his grandson, Gregory de Rokesle, a person of no small account in his time, having been Lord Mayor of London several times. As before stated, the Manor of Ruxley was formerly a distinct parish from North Cray till it was united to it by Cardinal Pole in 1557.

A curious custom used to prevail in this district of selling beer by the yard; some of these yard measures are still in existence, and are exhibited as curiosities, but cannot be used legally under the Weights and Measures Act. Crayford is mentioned in Domesday, which says, "There is a church." It is dedicated to Saint Paulinus, and has a nave, chancel, side aisles, a square tower and five bells. There are several fine monuments, and there was formerly an altar-piece, given by Sir Cloudesley Shovel, of May Place. This parish is situated in Lesness Hundred. May Place, a mansion about half a mile from the church, appears to have been erected about the time of James I., but it has been modernised. Shortly after 1694 this mansion and estate were purchased by Sir Cloudesley Shovel, the eminent naval commander, who was unfortunately shipwrecked in his voyage from Toulon in 1707, his body being buried with others on the sands of Scilly, but was soon after taken up and interred in Westminster Abbey. The river Cray here crosses the Roman Watling Street, and soon after falls

it this day. From the particulars of the auctioneer, Mr. D. J. Chattell, I gather the following information. On the ground floor there is a smaller outer hall, leading to a larger inner hall 55 feet by 11 feet 6 inches. The lofty library, about 32 feet by 18 feet, besides bay window. Banqueting hall, 40 feet by 22 feet, and 22 feet 6 inches high; this room is partly lined with fine oak panelling, and has a panelled ceiling and parquet floor. The billiard and smoking-room, 58 feet by 18 feet 6 inches. A massive oak Jacobean staircase leads to the first floor; here there is a drawing-room 30 feet by 19 feet (exclusive of bay) and 15 feet high, and has a coved ceiling with medallions and mouldings said to be designed by Inigo Jones. The picture gallery is 45 feet by 12 feet, with coved ceiling 13 feet high. The mansion stands in park-like grounds of 16 acres. The handsome wrought-iron gates in the front are believed to be of the time of Charles II. This mansion has historical interest, having, it is said, once been occupied by Edward the Black Prince, although Hasted and the older historians make no mention of it. He was married to Joan Plantagenet, his cousin, the Fair Maid of Kent, and was buried in Canterbury Cathedral. He died 1376, and his body is said to have lain in state at Hall Place before removal to Canterbury. The helmet, crest, shield, gauntlets and other relics hanging over the top

have recently been exhibited and described at the Society of Antiquaries at Burlington House. These relics must have formed part of the lying in state at Hall Place.

The illustrations of Hall Place are from photographs kindly lent by Mr. David J. Chattell, of Chislehurst.

THE NEW PUBLIC OFFICES.

A CORRESPONDENT of the *Times*, who is evidently under official inspiration, writes:—

It is an easy matter to criticise the action of a public department. Of all public departments the easiest to criticise is His Majesty's Office of Works, for the simple reason that every man, from the most eminent failure in public life downwards, is an authority upon matters of taste. So simple is the pastime of finding fault that it must have often occurred to those responsible for the administration of the country that no very apparent reason exists for entrusting the work of government to a specially selected class, and that any casually enlisted group of critics would fulfil all the functions of State in a more satisfactory manner than those entrusted at present with these arduous and unappreciated duties.

No Minister in recent times has done more for the improvement of the Metropolis, for the good administration of his office and for the gratification of the public than Mr. Akers-Douglas; yet, if Lord Wemyss is to be believed, no one is less qualified for the office he holds than the present First Commissioner of Works.

The President of the Academy led an attack upon the scheme, carefully considered as it had been by all the authorities concerned, for a great street improvement, and, although that eminent critic did not summon up courage to attend and argue the point with Mr. Akers-Douglas when invited to do so, his polite description of the plan as "idiotic" was endorsed by many, who, after hearing the First Commissioner's explanations, must have regretted their hasty acceptance of Sir Edward Poynter's views.

Now Lord Wemyss returns to the charge upon another controversial point, upon which the First Commissioner has had no opportunity of explaining the grounds of his action.

By an extraordinary fatality the two eminent architects entrusted with the designs of the great public buildings in course of erection in Whitehall died within the space of a few months. Their designs had been completed and had been exhibited for the information of Parliament. They had met with very general approval, the contracts for the foundations had been accepted, and the work was in course of being carried out.

On the death of Mr. Young the First Commissioner decided to complete the work under the joint supervision of Mr. Clyde Young and of Sir John Taylor. To this no objection was apparently taken.

On the death of Mr. Brydon a precisely similar question arose, and the First Commissioner decided that the work should be carried out by Mr. Henry Tanner, under the supervision of Sir John Taylor. It seems to be assumed that this decision was taken for financial reasons. This is not a fact. The main motive which actuated Mr. Akers-Douglas was regard for the comfort of the great body of public servants who will be called upon hereafter to occupy the building in question.

The chief concern of the public with both the new War Office and the buildings at the corner of Parliament Street is their outward form. This has been decided by the employment of the deceased architects, whose names will always be associated with the buildings in question. The internal arrangement of these offices is a matter of deep concern to the men who will have to spend long and arduous days within their walls.

In former times very little attention was paid to this not unimportant matter. The externally beautiful building which contains the Treasury is one of the most hopelessly unsatisfactory public offices which could be well imagined. Badly-designed rooms, incommodious passages, inferior ventilation and lighting and waste of space comprise a conglomeration of every fault, from the point of view of the transaction of public business.

The building erected in Chancery Lane (one of the most beautiful in London) for the Record Office is internally perfect for the purpose for which it was designed by Sir John Taylor. The General Post Office North, designed by Mr. Henry Tanner, is as satisfactory a building for official purposes as could well be constructed. The Admiralty, for the internal planning of which the architects responsible for the building would readily admit their great debt of gratitude to Sir John Taylor, is, from an official point of view, almost without a fault.

It is not surprising that, with these experiences to guide him, Mr. Akers-Douglas should have hesitated to deprive himself of the services of those architects connected with his

office whose knowledge of official requirements are unrivalled in the profession. Sir John Taylor's name stands high among living architects. It is true that Mr. Henry Tanner is less well known; but when Sir John Taylor was entrusted with the building of the Record Office he was not well known to the public, but the choice was amply justified. Time will in like manner justify the decision which Mr. Akers-Douglas has taken.

There is a further reason which weighed strongly with the First Commissioner. It has been too readily assumed that an eminent outside architect could be found to carry out Mr. Brydon's fine plan. Inquiries made with some care did not bear out this assumption. Eminent architects are men of strong individuality, deeply committed to their own ideas of art, imbued with their own notions of style, and, as a rule, absorbed by works of their own design, with very little time and less desire to bestow upon the work of others. It became speedily clear that, if an outside architect was to be employed, it would have to be a man of the second or third rank in his profession—assuming that the plan and elevation designed by Mr. Brydon were to remain unaltered. The First Commissioner not only considered that it was due to the memory of Mr. Brydon that his building should be erected according to his design, but he determined, for the sake of the intrinsic merit of the design itself, that this should be done.

These, then, were the reasons which actuated Mr. Akers-Douglas in recommending to his colleagues that the new building should be carried out under the superintendence of the architects of the Office of Works. Financially, it is highly improbable that any saving will be effected. The design has been paid for, and the executors of the late Mr. Brydon have received the money. The remainder of the sum set aside for "commission" will be employed—as it would have been by Mr. Brydon had he lived—in remunerating the subordinates who have to carry out from day to day, over five or six years, the work of variation and superintendence.

If, when the War Office and the great group of public offices at the corner of Parliament Street are erected, they prove worthy of their magnificent site, the credit will be due to Mr. Young and Mr. Brydon, who designed them, and if they prove satisfactory as official buildings, fulfilling the requirements and adding to the comfort of the public servants who will occupy them, the credit will be due to Mr. Akers-Douglas, for bestowing his confidence upon two of his own officers who have not hitherto abused it.

THE CHATEAU DE CHAMBORD.

THIS mansion was built in the year 1523 by Francis I. Henry II. continued the works, and it is said that these two kings had 1,800 workmen employed upon them for thirty years. It was altered by Louis XIV., and disfigured by his architect Mansard, who divided the noble internal galleries into two storeys by wooden floors, and also materially altered the low building at the back in order that it might accommodate the numerous retinue of the Grand Monarque. The building measures in front 80 toises and is 60 toises deep. The four corners are flanked by four great towers; those at the back are now low, but in Du Cerceau's view they are as lofty as the principal elevation, and thus materially add to the beauty and effect of the whole design. In 1749 they were low as they now are. The outer buildings enclosed an inner building, also flanked by four towers; the centre building is called the donjon. Each of these towers is 60 French feet in diameter. The central staircase is 30 feet in diameter, and from it radiate in the form of a Greek cross four Salles de Gardes, each 50 feet long and 30 feet wide. These Salles de Garde are vaulted in stone and have flat roofs. The panelling of the vaulting is ornamented with an alternate F and the Salamander; the roofs are ornamented by "quantité de cheminées très ornées, quantité de tourelles et croisées qui semblent récréer la vue de ceux qui se promènent sur ces terrasses." The central tower, about 100 feet high, is very much praised. There are thirteen staircases and 440 rooms in the château. The design is attributed to Primaticcio, but that it is really his appears very doubtful. In 1793 it was despoiled internally and greatly defaced externally, and the domain being about to be sold and the castle broken up, in 1821 it was purchased by the people in the reign of Charles X. and presented to the Comte de Chambord. Its situation is the very reverse of picturesque. It stands in a flat country three or four miles from the banks of the Loire, and in just such a monotonous position as Wolsey at about the same epoch chose for his palace of Hampton Court. The fosses which anciently surrounded it are now filled up, but can be easily traced.

The New Edzell United Free Church has been dedicated. The plans were prepared by Mr. P. H. Thoms, of Dundee.

NOTES AND COMMENTS.

If the houseowners of Paris were not detested as the worst specimens of the bourgeoisie, there would have been a revolution in Paris when it was decreed that the domestic drainage was to be united with the sewers of the city. But as they were without political influence over the mass of Parisians the formula "tout à l'égout" did not inspire the erection of barricades. The proprietors took their revenge by allowing the law to be inoperative. It is supposed that at the present time there are 20,000 proprietors in Paris who have allowed the drainage, if that word can be used, to remain in its former dangerous state. The authorities have tolerated the abuse for seven years, but at length they have been compelled to take action, and several test cases have been brought before the Tribunal de Simple Police. Various technical objections were raised by the landlords, but the magistrate decided against them. Such, however, is the state of the law that instead of the large sums which were claimed in some cases, damages to the extent of one franc only could be awarded, and in addition a fine of one franc was inflicted. But while the court was powerless in one way, it was able to make an order that the works required should be executed within ten days, and if the proprietors continued to be contumacious, then they could be pursued in other and more costly ways. Paris plumbers can now do an ill turn to their landlords by entering on a strike.

A PART of all the money collected in the Indian Provinces for a memorial of the late Empress will be allocated towards the erection of a great hall in Calcutta, which is to be the representative memorial of the whole of India. For example, in the North-West Provinces a sum of 41,823/ has been collected or promised. Ten per cent. will be given towards the cost of the hall. The towns of Cawnpore, Bulandshahr, Moradabad and Farakabad are entitled from the amounts of their subscriptions to local memorials, and the sum remaining after these have been allowed for is to be expended in the erection of memorials at the following great centres of pilgrimage:—Allahabad, Agra, Benares, Hardwar and Matra. The statues are to be canopied in the Hindoo or Mohammedan style, according to the local circumstances of each place. Prizes of 200/ and 100/ are being offered for the best designs, with estimates and plans, for these memorials. In the Province of Oude the contributions amount to about 17,000/; after deducting 10 per cent. as agreed on, two-thirds and one-third of the sum locally available are to be allotted respectively to memorials in Lucknow, the present, and Ajodhya, the ancient, capital, "to consist of a plinth, supporting a white marble statue of Her late Majesty enthroned on a chair of state and surmounted by a canopy." Should any surplus funds remain after the erection of the memorials they are to be invested, and the income accruing from them is to be devoted to distributing charity at the sites of the memorials on "Victoria Day." It is believed that they will form the nucleus of a fund which will be largely augmented hereafter by the gifts of wealthy citizens. The Oudh committee is sharing with the North-West Provinces committee the cost of offering prizes for the best designs and plans.

RED gum has unquestionably excellent qualities, but it does not follow that every tree is sound throughout and adapted for hard usage. At Brighton the tramway engineer and the borough engineer have been compelled to report that "the contractors are unable to obtain a sufficient supply of ALCOTT'S red-gum wood-paving blocks to enable them to proceed with proper expedition with the execution of the wood-paving works comprised in their contract, sections A and B, and that a large percentage of the wood-blocks delivered upon the works are not in accordance with the specification, and that unless the contractors are released from the obligation contained in the contract requiring them to use ALCOTT'S red-gum wood, great delay will be caused in the completion of the works." The tramways committee, having considered the report, passed a resolution permitting the use of "red-gum wood from any source, provided the same is of equal quality with that described in the specification." They have also

instructed the borough surveyor and tramways engineer to "exercise the powers conferred upon them by the contract and require the immediate removal from the works of the wood blocks considered by them to be unsound and improper for the work." In the battle between jarrah and red gum it should not be assumed that either variety of timber does not need scrutiny. In fact, at the present time the use of both timbers should be treated as only experimental, and for public as well as scientific reasons the examination should be as exact as possible.

THE Petit Palais of the International Exhibition of 1900 has greatly helped to extend the reputation of its architect, M. CHARLES GÉRAULT. He won the Prix de Rome in 1880, and during the last twenty years has received many medals and honours, but his Petit Palais has been his most serviceable friend. Among the admirers of the building has been the KING OF THE BELGIANS, who from time to time made sketches of various details and entered into consultation with the architect. It now appears that His Majesty is anxious to enlarge his palace of Laeken, and also is contemplating the erection of some buildings at Ostend, where the King has long possessed a residence on the Digue. M. GÉRAULT has been invited to Ostend in order to deliberate over the royal projects. The selection is a compliment to the architect, and shows the appreciation of French art, which is common beyond the boundaries of France. But Belgium possesses able architects, and it is only reasonable to conclude that they should have the first claim on the King's commissions.

It is only necessary to look into the shop window of a fashionable engraver or stationer in Paris to see menu-cartes which are evidently the work of trained painters. Many an artist in Paris, in the intervals of important commissions, is very glad to exercise his talent on such subjects. Acting on the spirit of this custom, the French Government has given commissions to painters for the cartes which are to be used at the banquets given to the EMPEROR and EMPRESS OF RUSSIA at Dunkirk, Rheims and Compiègne. For the first M. ANDRÉ DEVAMBEZ, a painter who was one of the winners of the Prix de Rome, has been engaged. His design shows France and Russia in the form of two women embracing in the air. They are enveloped in the French and Russian flags, and below them is the sea with a squadron of armed vessels. M. GUILLONNET in his design shows Peace and War seated together, while in the distance is a view of Rheims, its cathedral being prominent. Above, two children, one wearing the Russian crown, the other the Phrygian bonnet, are introduced under the flags of France and Russia, and the arms of the two countries form the central part of the design. M. EUGÈNE MORAND has been more decorative in the carte for Compiègne, for a view of the château appears in a framing of the style of the Empire; the arms of Russia complete the design. When so much importance is attached to cartes, as if they were diplomatic documents, we may be sure that French hosts will also be eager to purchase beautiful designs for their dinner-parties.

DIXON HOUSE, FENCHURCH STREET, E.C.

COTTAGES TO BE ERECTED NEAR HORNDON-ON-THE-HILL, FOR SIR JOSEPH DIMSDALE.

THESE cottages have been erected for Sir JOSEPH DIMSDALE on his estate near Horndon-on-the-Hill Essex, from the designs of Messrs. ERNEST RÜNTZ & Co. They stand some 4 or 5 feet above the level of the road and are set well back. The bases are of red local bricks and the remainder of external walls are finished with rough cast. The roof is covered with strawberry colour Broseley tiles. An effort has been made to provide a model scheme for cottages on a country estate by giving a compact and economical plan, and by simple but pleasing external treatment.

THE IMPERIAL THEATRE, WESTMINSTER.

CATHEDRAL SERIES.—CHICHESTER: EAST END OF NORTH AISLE

WINDOWS IN HOUSES.

By the late W. White, F.S.A.

THE purposes for which windows are wanted are principally these:—(1) To let in light; (2) to look out of; (3) for ventilation; and (4) it may be for ingress and egress.

It will be well, perhaps, plainly to state at first starting that these uses are not all perfectly compatible with each other. For instance, a window which is the best suited for prospect is the worst for admission of light, and *vice versa*. It is impossible for one window to answer both these requirements in an equally good and satisfactory manner. Something must needs be sacrificed. This is an unpleasant truth, but its full force will appear presently, and students ought to bear it continually in mind.

And first let us take the purpose of a window for letting in light, for lighting an apartment, or rather for lighting the occupants of the apartment in the fulfilment of their daily occupations. In order to effect this in the most useful and agreeable manner the windows must be so arranged as that the light shall fall fully upon the handiwork, without subjecting the operator to the distractions of upward shadows or cross lights. The light must fall from above upon the hand, the table or the book; and in order effectually to secure this the height at which the light is admitted should be never less than 4 feet from the floor of the apartment. Church windows again should for obvious reasons be still higher, and I could almost wish that a stringent law might be made against the height of church windows generally being less than 5 feet 9 inches or 6 feet from the floor line, or that of the east window being less than 8 feet 6 inches. For all rooms devoted to exclusive purposes of work or study a minimum of 4 feet ought to be adopted; and herein I should include also dining-rooms, kitchens and domestic offices of every description. This height, however, must be modified in the case of dining-rooms and studies in ordinary houses, which are generally used for other purposes of domestic use also besides eating and study. Still the general rule will hold good in other cases. In servants' offices there can be no reason for making windows lower than this, whilst there are many reasons for making them even higher. And again in lobbies, entrance halls and apartments which are not used for sitting in the windows never should be lower than this. I could mention many instances of the cold and desolate effect given to the whole place merely by such apartments being lighted by windows with low sills. And indeed the effect of low windows in such position is not only cold and desolate, but gloomy too; the apartment is neither perfectly nor pleasantly lighted, and perhaps the patch of light falling upon the floor inside the window, which at once attracts and distracts the eye, throws the rest of the room into painful contrast with itself. In other rooms, such as drawing-rooms, the case is very different. The objection is not so strongly felt in a mere sitting-room: the room being evidently arranged in every respect for sitting in, the mind immediately makes the necessary allowance, and the unpleasant sensation of the window being made to light only one's legs and feet is not felt.

In an official or a public building the light can hardly be admitted too high. If it is let in at its proper height—that is to say, well above men's heads—one can hardly get into another's light, and the whole place is then pleasantly and equally lighted. Light naturally attracts the eye, and the eye always feels much more pleasure in being drawn upwards than downwards. It is just this which, so far as light is concerned, constitutes the difference between what is cheerful and what is depressing. It is nevertheless well worthy of observation that light should never be admitted directly from above through a horizontal aperture or skylight, but through a vertical opening in the wall or roof. If the light falls vertically one can hardly help getting into his own light. The best angle for light is perhaps one from between 45 deg. to 60 deg. with the horizon. This insures the having light directly from the sky, and that which does come directly from the sky is stronger and purer and pleasanter for all purposes of reading and work than reflected light, for unless the light is pure and free, and does fall upon the object at an angle from above, the side or the edge of that object will be unduly lighted whilst an upward baffling shadow is cast upon the work, the fingers or the book. And light which radiates from below one's work not only casts this unpleasant shadow upon the work, but is also distracting to the eye itself.

The unpleasant and distracting effect of light let in by windows reaching to the floor is made most manifest by the fact that even in a gloomy room actual advantage oftentimes is gained by closing the lower shutters of such a window, and I know of a house with windows so constructed whose occupant has requested me to advise him as to the most effective means of altering them on this account.

This baffling shadow cast upon the table, the fingers or the book, as well as the direct influence which it has in dissipating

the light and affecting the eyes, has also another injurious though indirect influence, which is seldom thought of. It seems to induce in sensitive persons and in those who have a great deal to do in the way of mental application a nervous restlessness or depression, of which at the moment they may be hardly conscious; but anyone who has felt the relief of the drawing up of a window-blind after he has been unconsciously or remissly working hard with an insufficient light, and this chiefly admitted below the blind, will at once know what I mean.

Some say that too much light is more detrimental to clearness and freshness of thought than too little, for that the reasoning powers are distracted by the noonday glare; that twilight is the most favourable to deep and close intellectual contemplation. This also is true; but if the powers of vision have to be exercised equally with thought, and in anything like a proportionate degree, then a good and properly falling light is needful to prevent distraction. The powers of the mind are in their fullest and freest strength when the bodily senses enjoy the greatest degree of repose and freedom from undue nervous excitement, and anything which tends to quiet the nervous system acts as a tonic to the mind.

Different persons, it is true, are differently constituted; one will need much light, whilst another is more than satisfied with a little; and hence it is impossible to legislate accurately for all. Still it may be undoubtedly laid down as a general rule that men of equal constitutions and of similar pursuits will need an equal amount of light, and of about the same description. Mapping and fine drawing require the best light; for reading a moderate light will be sufficient; whilst writing or rough drawing require the least; in fact, for writing one only needs enough light to see that the lines keep their proper parallels without running into each other; and since what would be light to one would be gloom to another, the only way correctly to judge upon the merits of the case is to take an average, or to compare equals with one another.

I said that, in order to be the most useful, light ought to fall so pleasantly as to induce the greatest composure of the nervous system.

Everything ought to be done which can be done to induce habits of composure and earnest application to that work which is in hand. Men, however, who are reading hard often say that excitement helps them on; but this is nothing to the purpose, for the excitement which does aid a man in his work is not the result of outward causes, but merely of close application to that work. And these same causes and effects extend also to concert-rooms, and to all such rooms as are used for lectures or public speaking. The mind is more braced to attention, and is in a much fitter state for listening when the light is admitted high than when it is admitted low. And there can be but little doubt that even in such a room as that at Willis's a morning concert would be listened to with much more composure and pleasure by the majority of the audience if the two lower panes of the windows were walled up, and that in a meeting there for any general purpose there would actually be less inclination and inducement to listless talking and inattention to the business in hand—the effort of listening being so greatly increased by the needless extra work forced upon the eye by the excess and distracting direction of the light.

We have only now to consider the windows of bedrooms. These are certainly more for letting in light than for looking out of. They may however be as low as 3 feet 8 inches from floor to glass line, and in some cases where there is no chance of being overlooked and where there is a sufficiently pleasant view this height may be reduced to 3 feet 4 inches. Some people talk of the pleasure of looking out of window as they lie in bed, but this is certainly not enough to justify the making windows otherwise uncomfortable or inconvenient, and the feeling of exposure which low windows give is quite sufficient cause for making them higher than would be otherwise necessary. Moreover, a bedroom need never be arranged for either sitting in or looking out of, although, as in the case of invalids, it might occasionally be of very great service to have them so. On the other hand, it is said that this objection to low windows is entirely obviated by the use of window blinds, which may be let down or drawn up at pleasure. But it is not so. For it is the lower part of the window which wants the blinds. Directly the blind is lowered below the level of the eye the room is rendered gloomy and depressing, excepting only when a blind is wanted to exclude the direct rays of the sun. If blinds drew up from below the case would be very different. And, for myself, I feel so strongly the unpleasantness of excluding the higher portion of the light that I would suffer almost any amount of other inconvenience rather than have a bar of shade across the window below the eye. In street houses, of course, more care must be taken to guard against the unpleasantness and inconvenience of being overlooked than in the country.

But though I advocate high windows, it must not be supposed that I therefore advise the exclusion of landscape from bedroom windows. I know too well the delights of look-

ing out upon a fair scene to advise or even to tolerate this; but what I do say is this, that if windows are 3 feet 8 inches from the floor they will be low enough to allow of looking out with ease, and 3 feet 4 inches will be low enough for anyone even when sitting (if near the window); and a less height than this can be in no wise needed for bedrooms except in the case of those built expressly for confirmed invalids, when they might be perhaps as low as 3 feet 2 inches. But then to allow for light thus diminished near the floor by the having high sills, the windows ought to be proportionately broad, by which means not only is a fuller light obtained, but the extent of prospect increased. As regards amount of light, bedrooms ought to have light sufficient to make them cheerful, although the need of much light in a bedroom is not felt as in an actual workroom, and if the windows are but broad they need not extend to any considerable height in the room; indeed, so that the lintel or window-head really is well above the eye, there is no need for carrying it up to the ceiling; 6 feet 1 inch is enough for cottages and for garrets, and 6 feet 4 inches for other ordinary purposes, and it ought not to be above 7 feet 6 inches except in large and lofty bedrooms. The air of quietude and repose imparted by having the upper part of the room thus slightly shaded is indeed very desirable in a bedroom, and that height is quite enough to dissipate the effect of gloom which is given by a low window with an insufficient light.

2. We now come to the uses of windows for the purposes of prospect. For purposes of prospect the very reverse of all this is the best. The windows should come nearer to the ground, so as to enable the eye easily to take in the foreground (if it be worth taking in) as well as the distant landscape. The head of the window, as just suggested for bedrooms, should be comparatively low, so that the eyes may be shaded from the full glare. Then the prospect looks the brighter, and the eyes see the clearer, and it is in every way the more agreeable to the person who is looking out. The shade of the room around him places him in a position of repose for seeing the bright scene without. The window-sill being low, he may enjoy to the full a foreground of lawn interspersed with flowers, and perhaps some woodland scene beyond. And this is the sort of window best suited for this purpose; broad and low, and withal opening upon a good rural view or a well furnished flower garden. This too is the sort of window for those who enjoy an idle, useless life, and spend more of their time in lounging than in labour. Still this is not the best sort for general use, at any rate in such a climate as ours, excepting only for such apartments as are used solely or chiefly for purposes of pastime or light occupation. Still, those who do wish, on any of these accounts, to have their windows low, may adopt a standard height of 2 feet 4 inches from the floor, but any height up to 2 feet 10 inches will be found far better.

A low window with a good prospect is pleasant and cheerful in summer, but in winter it is accompanied by several disadvantages, independently of those already named. It is cold and uncomfortable in appearance, and in reality too. So thin a partition as that formed by the glass, and so near the floor, admits more actual cold than is admitted elsewhere. Since cold air is the heaviest, the cold is always the greatest next to the ground; and in our climate houses ought to be built more with reference to winter than to summer use. The prevention of discomfort may surely be taken into account equally with the gain of an actual enjoyment; and who would deliberately and advisedly build for a few bright months, when the greater part of the year is comparatively stormy and cold, or at the best changeable and uncertain? And then again in winter, when days are short and evenings long, low windows waste the light; moreover, the room gets dark the sooner, nor does it derive so much benefit from the evening sun as a higher window would. In Southern Europe, where the sun is more powerful, and is more often shining, the air clearer and the light purer, low windows are not liable to the same objections. Indeed it is necessary there to have the lintels and heads of the windows low, in order to shut out the glare and heat of day, and to obtain the full benefit of the cool and refreshing evening air. Windows there may, or rather ought to, open fully to the floor. The summer sun is often almost unbearable, and well may pierced or palisaded balconies be profusely used to let in air, whilst they screen the apartment and afford a pleasant retreat for an evening lounge. But in England it is otherwise. In England those who have houses large enough to enable them to set apart rooms exclusively for summer and for winter use may have their summer rooms arranged with every regard to summer use and summer enjoyment; but those who have to content themselves all the year round with the same rooms will find their comfort increased and their discomfort greatly diminished by guarding rather against the storm of winter than the sun of summer, and by sacrificing (since sacrifice must be made) rather the ideal enjoyment than real convenience; and especially since this real convenience does also involve an air of comfort too.

It appears then that these two main uses of windows are not fully compatible with each other; and hence people have,

in some degree, to decide for themselves whether they do prefer light or prospect; whether they will have windows high or low; what they will give up and what accept.

Something must be given up in one way for the sake of gaining advantages of another sort. It is like a choice of roads to the same place. The traveller most accustomed to driving will often choose what seems the longest way, if it be but the best road and the most level; having due regard to his journey's end and the weariness of his beast for to-morrow's work, he gives up the beauty of a rugged and hilly road, which another less considerate might have chosen, regardless alike of his horse's knees and of his own neck. And however well the argument of a beaten road and well known track may be urged in favour of an application of the simile to the other side of the question from which it is meant to apply, most at least will agree that it is high time to lay out a new road to our destination other than that which our forefathers of the last generation have trodden; and if it is laid out at all, it may as well be such as can be travelled over with safety and with satisfaction.

3. We now come to the third branch of our subject—the use of windows for purposes of ventilation. For proper ventilation, the nearer to the floor and the nearer to the ceiling the apertures are the better; and hence perhaps long and narrow sash windows are the best. But seeing that proper ventilation is more effectually acquired by other means than by windows, and that the angles of rooms take the currents of air more speedily than the middle wall-space, there is no need to discuss very minutely whether windows long or broad are the most effectual. It will of course take some little time for us to get into the way of ventilating rooms otherwise than by windows, or to believe and feel that they are properly ventilated but by seeing the windows themselves stand open; but it will come sooner or later. However, sashes are the best for letting air in and out, at the top and bottom, while casements have the advantage of opening fairly and freely from top to bottom, which sashes never can, excepting by means of elaborate and costly and inconvenient contrivances.

4. Windows are so seldom wanted for ingress and egress that we need hardly waste words upon them. However, it will be well to observe that in such cases there should always be, for reasons before alluded to, a step which does not open with the casement or sash, of at least 12 inches high from the floor, which will at any rate just prevent the bitter draught to the feet from which so many suffer in consequence of this rule not being carefully adopted, as well as some of the danger of breaking a pane when it comes nearer to the ground than this.

Having now discussed the four main branches of our subject, we must turn for a little while to the proper disposition of windows in a room. Nothing need here be said about putting windows over fireplaces in a general way; excepting perhaps that for reading at the fire, the window is there in the worst possible position. The back of the book gets lighted, but not its pages. And again, for one standing and looking out of such a window it is very unpleasant, whilst for one sitting it must necessarily be out of reach. Nevertheless there are notable exceptions to this, but only when looking into a conservatory either so situated or so constructed as that no sky can be seen by any one looking out, and I have once seen a most fairy-like effect given by one so arranged, with mirrors on either side so placed as to reflect each other and the conservatory, and making it difficult to detect the manner or cause of the illusion. This, however, will hardly touch the generality of instances in common houses. Neither is it well to place a window exactly opposite the fire. There are reasons for this which we will not here enter into, for the objection itself is obviated by the simple alternative of having two windows, with a pier or space between them. This space, being immediately opposite the chimney-glass, is a most fitting place for the reception of another mirror, whereby a pleasing and cheerful effect is always easily attainable.

Neither is it well to place the window or windows in the end of a room when they can be possibly placed at the side, nor ever on two opposite sides or ends of a room, with the exception, perhaps, of a very small window; but this should never be directly opposite the other windows. Nor is it well to have too many windows at all, nor to have two windows at the side of a room in addition to one at the end, unless the room be at least 25 or 26 feet long. No proper unbroken wall-space can be in such a case left for furniture (when the doors and fireplace are taken out), and a sufficiency of wall-space is most essential in order to make a room even moderately convenient or comfortable.

Again, when windows are placed in two adjoining sides of a room one window should generally be higher from the floor than the other, for the avoidance of cross-lights and the feeling of being looked through, as well as for other minor considerations of aspect and prospect.

We come now to the height of window-heads and the proportionate size of windows. Rules can hardly be laid down for proportioning the size of a window, or superficial measurement of glass-space to the given size of an apartment to be

lighted, so very much must always depend upon various local and accidental circumstances of the case which have to be taken into the account. In a close and shaded situation there must be a larger quantity of window proportionate to the size of the room; in a bright and open situation, where the horizon is clear and distant and no near trees intercept the light, less will be required. So also if the house stands low, or looks out upon rising ground, rather more window is required, and it ought to be raised the higher from the floor; whilst if the house stands upon high ground, or is upon an elevated basement, the windows may be proportionately the smaller and nearer to the ground. And, again, if the immediate foreground forms the chief feature of the view, if the garden is closely bounded by hedges or houses which shut out the horizon from sight, one's only resource is to take the greatest pains in the laying-out of the garden, and to make the windows comparatively low for the full enjoyment of the garden view. But if the houses which bound the prospect are such as to overlook one's own windows too nearly they will be with more advantage treated as the windows of street houses ought to be treated, with higher sills, to save the feeling of exposure which a more open window gives.

Again, in order to obtain an equal amount of light the upstairs windows need not be so large as those below, and garret windows may be the least of all. Thus, if we say as a general rule supposing the windows to be rightly arranged, and the light tolerably uninterrupted by interposing objects, that common sitting-rooms require from one-fifth to one-eighth part of the wall in which the windows are placed to be of glass, then kitchens and domestic offices where the sills are higher from the ground will require from one-eighth to one-tenth, and bedrooms from one-tenth to one-twelfth, whilst from one-twelfth to one-fifteenth will be found ample for garrets. And, generally speaking, I believe these proportions will prove to be somewhere about the best.

Neither is it possible to lay down rules for proportioning the length of the window to its breadth, excepting that when the approximate dimensions are decided upon its actual size may be more accurately reduced by measure to some scale of just and harmonious proportion, for however much attention is paid to reasonable arrangement in regard of use and convenience, there is cause, not for disregarding the laws of beauty, but rather for working them out to their fullest extent, so far as the restriction and requirements of use and convenience will allow.

In setting out the sizes and proportions of windows the height of the sill from the floor is in almost all cases the first point to settle, and when this is determined the height of the window-head may be next proceeded with, and then the breadth. The height of the head must partly depend upon the amount of light required, and it will generally be at the least 18 or 20 inches below the ceiling, excepting in cases where an unusually strong light is needed, and a great deal of it, or when the windows are placed in the ends of a room. But ordinary window-heads should never be lower than 6 feet 4 inches from the floor, nor will it generally be needed so low as this, excepting in very small or very low rooms. But it is very desirable on almost every account to get breadth of window. By having windows broad light is the more pleasantly diffused; there is the less amount of unlighted space in the room, and should any one chance to cross the window or to stand before it he does not cause that tiresome obstruction of the light which is caused by any one standing before a narrow window of the common sort, and if there is a sufficient breadth there is the less cause for the window-head being carried so very high to the ceiling. The curtain "valance" then may be hung clear above the lintel, instead of its being hung, as it now so generally is, to cut off nearly all the upper pane of glass.

Then, as to the amount of light, it will universally be found that, so that there is sufficient light, the less window the better. People make so much confusion between window and light. The fact is that almost every one, myself included, likes light and prospect; but then so many seem to think that the largest aperture, the greatest possible amount of window, too, is desirable. This is not the case. For warmth in winter, for coolness in summer, for cheerfulness, for convenience, for comfort, the less window the better, so that it is but well arranged for the admission of light and command of prospect. The cheerlessness of a room all window, and the gloominess of a room with insufficient or ill-admitted light, are widely different in kind, but both are equally depressing and equally uncomfortable.

There is yet another very strongly controverted point; it is with reference to aspect and prospect, and as to whether of the two ought to be sacrificed when it is needful to sacrifice one. My own opinion and feeling are that, excepting in exceedingly rare instances, the house ought to be placed with the most regard to aspect. It can surely be but little less than madness to sacrifice the perpetual comfort of a house to the enjoyment of a landscape which may be better seen and better enjoyed out of doors. And yet there are houses so placed as to receive

the beat of the south-west storm of winter and the burning of the south-west sun of summer merely for the sake of the view, and this in the most exposed situations and when the occupants have no chance of the slightest change or the slightest relief. Whichever room they use it is all the same, and it is the same all the year round.

But I would go further than this. In selecting a site and arranging windows for prospect care rather ought to be taken not to choose the most prominent feature or the most extensive or striking view of the whole country, excepting perhaps for one out of three sitting-rooms. If such a view is selected for all, or for the greater number of rooms, it not only precludes the possibility of change by change of room, but in our daily walks, when, most of all, we require change of scene, a different phase of this same scene is almost ever to be seen. Still we have the great and exceedingly beautiful varieties which the scene itself presents all the day long by change of light and shade, and the other accidents of weather and of season, but these are not in themselves enough.

And now for aspect. The best of all possible aspects is the south-east; the worst possible is the south-west. As a general rule I would say that where choice can be had the range should be taken from south to north by the east, and that the range from south to north by the west should be avoided. All the merits of the different aspects are too numerous to be discussed in detail, but some of the most salient points ought not to be passed over. A southern aspect is one that commends itself to most people; it is congenial to the feelings of almost every Englishman. It is cheerful, without being glaring; it is warm, without being oppressive. In winter it has the full benefit of the sun and in summer it is in some measure protected from the full power of his rays; for in his meridian height he is then too high to reach far into the apartment, and by two or three o'clock, when he is in his full strength (the freshness of morning no longer counteracting his influence as it has done till mid-day, and in winter, when he has by the afternoon lost his power and can only shed a few sickly rays far across the room), he has gone round sufficiently far to prevent any unpleasantness arising either from his power in summer or from his lowness and weakness in winter. But west is bad. A summer sunset, it is true, next to a sunrise, is one of the greatest glories of nature, but then it is seen to far greater advantage and with much more pleasure out of doors than from within; and in winter the sunset may be seen equally well from a southern window. There is, however, no objection to the southern side of a house having eight or ten degrees of westing in it. It will add to the pleasantness, without involving any accompanying disadvantage.

Then, again, no one ought to be satisfied without some windows to the east. A morning room ought always to have the full benefit of the morning sun. To those who suffer from depression of spirits, to all young people and to all who are in the least invalided, I believe the benefits of the morning sun, whether in summer or in winter, are incalculable, whilst they feel the faintness of his evening rays. In schools, again, this consideration is of still greater consequence. A clergyman, now for many years engaged in tuition, has told me the result of his own observation and experience in this respect. He says that the cheerfulness of the morning sun sets up scholars as well as master for the rest of the day. They begin in good spirits, and they go on in the strength of them for hours; whereas, if they have only western or south-western windows the schoolroom is cheerless and dull for the morning, and when the sun has got round sufficiently to gain admission they are fagged and jaded and unable to bear the glare and faintness of the light, which in the early morning would have been to them such a gracious boon.

A north-eastern aspect is now the only one requiring consideration. At first sight its opposite, the south-western, would perhaps find the greatest favour, excepting with those who have had an equal experience of both. But the north-east really does not deserve all the bad words used against it. Its equableness of light makes the room pleasant for the eyes, and useful for work; for many occupations and for many persons, it is on this account the best of all aspects. And again, even for purposes of prospect it has many and great advantages; for example, the eye is in repose, and in looking out of window one sees, not the gloomy, but the sunny side of the landscape; one sees the bright side of things, whilst the eye itself is not offended by the light. In the after part of the day, on the contrary, if you look towards the south-west you see the shaded side of everything. Everything looks sombre and grey. People often forget that in looking towards the source of light they only see shadows; and yet I find that practically they often break out into admiration of an evening view towards the north-east, when the lights are falling prettily upon the trees or fields, even when they have just been saying that there can never be anything bright to be seen in the north-east. It is from the name that they take their impressions, saying to themselves that surely nothing can be cheerful in that direction from whence come all the bitter winds of early spring, and

know how many years I laboured under the same delusion, till my eyes were opened by an artist, who taught me many valuable and interesting lessons of effects in nature. But what I wish to convey will be much better and more easily understood by calling to mind how many times in an evening walk one has turned away from the sun in order to enjoy more fully all the beauties of the landscape. We may also call to mind how universally it is the practice to pull down the blinds to shut out the western and south-western sun. And those who have lived much in London will at once testify how entirely this extends to town life, excepting that they will be far more of one mind in preferring east and north to south and west. I do not, however, pretend to say that the gentle warmth of the winter sun is not deserving of some allowance being made even here in favour of windows looking out to south or south by west.

There has been so much to say upon the form and disposition of windows that there is hardly time to touch upon their construction; it must, however, be noticed that windows which are narrow and high almost naturally suggest the use of sashes, whilst those that are broad and comparatively low almost necessarily involve the adoption of casements, for the window must be divided into a number of compartments by monials of some sort or other, and if sashes are hung in them they are of necessity too small to be properly useful. So then it is not just a mere matter, as is generally supposed, of simple choice between sashes and casements, but of essential principle in the general form and proportion of the windows themselves. The question is one of great controversy, but this will help to solve it. And since casements have several advantages over sashes, as in other respects sashes have the advantage over casements, it will not be needful to discuss this point here, and I will therefore close this part of our subject by answering one general objection to the use of casements, viz. that they will not keep out the weather. Unhappily many casements do not keep out weather. But why? It is simply and solely because the rebate is made $\frac{1}{2}$ inch or $\frac{3}{4}$ inch wide, instead of three times that width. The love of uniformity and desire of hiding construction has induced the method of having the casements which are hung to come within the same line of muntin with the lights that are fixed, but if a casement is properly made and hung it will not only keep out wet but it will keep out more wind also than sashes will, and be more free from noise and rattle, as well as being less costly and more easily renewed when decayed.

We now come to one more point of general dispute, viz. the respective merits of large panes and of lattice-lights. Much of the difficulty disappears, however, when we come to throw the two into their respective positions. Large panes are good for prospect and for clear unbroken light, and hence they will naturally be adopted for general living rooms in ordinary houses. Lattice-lights again are useful and pleasant for softening and subduing the light. Separating the rays instead of breaking them, they act in some sort as blinds without being open to the objections which blinds and ground glass are subject to, of destroying the quality of light by preventing the admission of a single clear and perfect ray, and hence they will be used for churches and schools, and all institutions where windows are wanted not so much for prospect as for application and work. And again for domestic offices and for cottages they will be used as being the cheapest and as being the least susceptible of breaking, and the easiest to mend when broken, and causing the least inconvenience till mended. Then again with lattice-lights we necessarily have saddle-bars and stanchions. These save shutters and afford far greater security. The feeling of quietude and repose too which they give renders them especially fitted for churches, wherein not only are separation from the world and exclusion of its full glare symbolised, but thoughts and feelings appropriate to the place are suggested and imparted—not that such thoughts and feelings will be forced upon all that enter, but if the building be otherwise good, those who wish to entertain them will be aided in their endeavours by means of the external assistance which such treatment gives.

LORD CRAWFORD'S MANUSCRIPTS.

WE are enabled to-day, says the *Times* of Tuesday, to make the interesting announcement that the celebrated collection of illuminated and other manuscripts belonging to the Earl of Crawford has been sold *en bloc*, through the agency of Messrs. Henry Sotheran & Co., to Mrs. Rylands, the founder of the John Rylands Library at Manchester.

What distinguishes the Crawford collection from other like collections, such as the Ashburnham—dispersed in various ways and directions during the last twenty years—is, first, the early date of the principal MSS., and, secondly, the number of marvellous bindings in metal and ivory, dating from the twelfth and thirteenth centuries, which gleam from the show-cases. To these we may first direct attention. They are familiar to

bibliographers and specialists, for Lord Crawford has often lent the whole or part to exhibitions in London; but to the world at large they are as yet unknown. Their extraordinary rarity may be gauged by the fact that the Crawford collection, which contains only thirty of these bindings, yet ranks third among the collections of the world. By far the richest is the National Library in Paris, which contains a large number of the books of this class, seized and saved from dispersion at the Revolution. Next comes the Royal Library at Munich; and then comes Haigh Hall. The British Museum contains but half a dozen, the South Kensington Museum one, the Vatican one or two, the collection formed by Sir Thomas Phillipps four or five. One example, perhaps the finest in the world, remained till the other day in English hands; it was the famous "Lindau Gospels," in cover of pure gold and gems, which Lord Ashburnham lately sold to an unknown private purchaser for 10,000*l*. There is nothing of quite the same importance here, but many of the covers are of great beauty and interest, none the less so for the process of building up which they have undergone in long-past centuries. The normal course of things seems to have been as follows:—A monastery owned a precious tenth-century textus of the Gospels; it also owned an ivory pax, or tablet carved with a sacred subject, perhaps of a century later. Then, a century later still, it occurred to some rich abbot to have the second made into a cover for the first, and he would call in some jeweller or metalworker from Cologne or Liège who would encase the ivory tablet in a richly-jewelled metal frame and make the whole into a cover to preserve the MS. Often in the instances before us the MS., the ivory or enamel centre and the jewelled or chased border are of different centuries. But in nearly all cases the result of the joint work of the carver and the goldsmith is of singular richness and beauty. One of the finest (No. 253 in the hand list of the Bibliographical Society's Exhibition, 1898) has for its centres two plaques of twelfth-century Limoges; its background is of silver stamped from dies of the thirteenth. Round these are figures of saints in ivory, and the whole is enclosed in a border of exquisitely carved and gilt wood, not much later. Another (246 in the same list) is a book of the Gospels, the MS. of German work of the early twelfth century, and the case of the same date, evidently made for the book, a fact which ought to settle the controverted question whether books of this date had as a rule a thick embossed cover on both sides or only on one. Here the central ornament has disappeared, but there remain the heavy borders of gilt copper, enriched with Limoges enamels representing the Apostles, the Virtues, &c. A third, the double cover alone remaining, is the celebrated one which belonged to Samuel Rogers and then to the late Mr. Bateman, at whose sale Lord Crawford bought it a few years ago. The ivory carvings are of the tenth or eleventh century; the metalwork, of the twelfth, is probably from Trèves, which was for a long period the great rival of Cologne in the realm of German ecclesiastical art and culture. Many of the books in this collection bear indications of having been made, or kept, in "the stately town of Trier," while Cologne and Liège can claim an equal share. But in only one instance is the enamel certainly German, or accepted as such—though we suspect that further research will succeed in stripping Limoges of a good deal of early work in many collections which is at present attributed to it. The German piece (264) is a figure of St. Andrew on a plain background of gilt metal, an admirable specimen of twelfth-century work. It is interesting to compare such work as this with an exquisite example of French art of two centuries later, the two leaves of an ivory diptych which enclose a manuscript *Horæ* (250). In this small and delicate example the rudeness of archaic art no longer appears; the craftsman is a master of his tools, and, whether he carves a Crucifixion or a *Via dolorosa*, he has left far behind the grotesqueness of the earlier art beyond the Rhine.

As to the manuscripts themselves, our difficulty is to choose among the large number of finely-written and finely-illuminated examples; but we may call attention to a few, especially to the early books, for it is these which chiefly distinguish the Crawford Library from all others that remain in private hands. Of the Latin manuscripts, whether produced in Italy, Spain, France, Germany, Flanders or England, there are some hundreds; let us indicate a few of the finest. One of the most important texts, though quite unadorned, is a manuscript of the letters and opuscula of St. Cyprian, written in a bold, clear hand in what are known as Merovingian characters of the seventh or early eighth century. This has been traced by the ingenious researches of Dr. Traube, of Munich, to the Abbey of Murbach, in Alsace; it ends with a prayer, "Orate pro dño bartolomeo Abbate," the abbot by whose order the precious volume was transcribed. About a century and a half later is one of Lord Crawford's most recent acquisitions, a magnificent Psalter of the ninth century, which till lately was in the library of the Bollandists at Brussels. Historical students will appreciate the long and important necrology at the end—a list of the death-days of many monks and abbots—while to the student of

art history there is a great interest in the remarkable letters with interlaced patterns of the type commonly called Celtic—the type which seems to have spread all over Europe from the Irish monasteries about this time. Of the tenth century is the book of the Gospels (19) written and illuminated for the Emperor Otto the Great, with his portrait; while from about 1150 date two remarkable manuscripts made in Spain, the “St. Beatus” (30) and the explanation of the Psalms by Cassiodorus (31). The Spanish art of this date is singularly coarse, and in one of these books there is assuredly the oddest map of the world, the strangest jumble of fantastic geography that ever came even from a monkish hand. To the thirteenth century belongs a missal of great interest, for it is of English origin; it is “ad usum Sarum,” and is inscribed “Memoriale Henrici de Cicesteria Canonici”—a very early record of a canon of Chichester, and probably the most venerable Sarum missal in existence. A little later comes the very beautiful small Horæ from the Bollandists’ Library, remarkable as being in its original wooden boards and quite perfect and untouched. Perhaps a little earlier is a very important Psalter written in Paris, almost certainly by the same person who executed the manuscripts given by St. Louis to the Sainte-Chapelle; a beautiful book, valuable both for its five pages of miniatures and its illuminated capitals, and also for its historical associations, for on a blank leaf we read, in very delicate handwriting, the words “Royne Jehanne.” In other words, this book belonged, a century and a half after its production, to Jean of Navarre, Queen of Henry IV. of England.

But, if these early manuscripts give its special note to the library, it must not be supposed that it is poor in later works, brilliant examples of the twin arts of calligraphy and miniature painting at their best; arts which reached their high flowering time at the moment when printing came in to supersede them for ever. There are many very first-rate examples of fifteenth-century work in the collection of Italian, Flemish and English *provenance*; and there is that little masterpiece of French art, the “Genouillac Horæ,” with many full-page miniatures (especially one of the Adoration of the Magi, where everyone is dressed in white) of the most enchanting beauty. The finest of the Italian works is dated 1402; it is in three large volumes, full of truly marvellous miniatures, and made historically interesting by the portraits of the Malatesta family, to which it belonged. A book like this, perfect in condition and certain in date and origin, is naturally a most important monument of Italian art at the end of Trecento; and, doubtless, when it has been made easily accessible to scholars and to all the world it will soon be taken as a text for many a learned and fruitful treatise. More splendid, but belonging to an epoch when art had become too self-conscious and conventional, is the celebrated Colonna Missal in six large volumes, made about 1517 for the Cardinal Colonna, and adorned with a multitude of Raphaelesque illustrations. The late Lord Crawford used to attribute many of these to a certain Phillipus de Corbizis, by whom there is a signed illustration in a missal at Siena; but it is safer to group them generally under the title “School of Raphael”; for the miniatures have the want of individuality, together with the accomplishment, the grace of outline, the brilliancy of colour and the frankly pagan sentiment which we find in the works of the Roman artists under Leo X., who worked under Raphael’s name and guidance. The missal is incomplete; one other volume is known and others may be in existence, but it is perfect as far as it goes, and is in its original binding. All the volumes are in richly-tooled red morocco, except that containing the Office for the Dead, which is in black. The last of the European manuscripts which we need mention are three English works. The finest (60) is the celebrated copy of Lydgate’s “Siege of Troy,” which sold for a very high price in the Perkins sale many years ago; it is not later than 1420, and the borders and illustrations are of extraordinary richness and beauty. Another volume is Lydgate’s translation of Boccaccio’s “Falls of Princes,” a plainer, but still important, volume from the Osterley Park library; and a third English book of great value is the copy of Wycliffe’s “Gospel,” which was presented to Queen Elizabeth on her accession by Francis Newport, who had narrowly escaped martyrdom under Queen Mary.

We cannot pretend even to indicate the wealth of the library in the matter of Oriental manuscripts of all ages and languages—Armenian, Singalese, Tamil, Canarese, Tibetan, Burmese, Siamese and Malay manuscripts are here in abundance; here, too, are many examples of those curious and rare productions, the medicine books in the Batak language. These things are, of course, curious; but of more general interest are the vast number of very precious Persian and Arabic manuscripts, the Egyptian papyri, the Coptic manuscripts ranging from the sixth to the fifteenth century, with which for the moment we may class one of Messrs. Grenfell and Hunt’s greatest discoveries, the earliest vellum book in the world, containing ten or twelve pages of the “Odyssey,” probably in a handwriting of the third century. Unluckily, this is not so well preserved as are the papyri, of which the library contains

a great many; even in the dry Egyptian climate time has wrought grave injury, and only a small part of the fragment is quite decipherable. As to the Persian and Arabic manuscripts, they form one of the richest departments of the library. The examples of the Koran, portions or the whole, are extremely remarkable; we may note some pieces in the Cufic character, dating from the eighth and ninth centuries A.D., which are of extraordinary beauty and value. One book of 467 leaves, written on thick Bombycine paper, and of the date 1500 A.D., must be one of the largest volumes in the world; it measures 34 inches by 21 inches, and each of the huge pages contains only ten lines in bold and noble handwriting. Altogether the Persian, Arabic and Turkish manuscripts were 1,851 in number when Lord Crawford compiled his hand-list in 1898, and the importance of such a collection, if it is to be made accessible to Oriental scholars all over the world, cannot easily be over-estimated.

RUSKIN MEMORIAL MUSEUM.

ON Saturday the Ruskin Memorial Museum at Coniston was opened by Canon Rawnsley. The museum is a plain room 30 feet square, at the rear of the Coniston Institute, and will contain the paintings, sketches and other works of John Ruskin. The north side of the room is devoted to the exhibition of natural history relics, and to engravings and views of his homes. The south wall is hung with pictures of local interest, and others illustrating Mr. Ruskin’s writings. The east portion contains drawings by him, Greek relics dug up in Cyprus, MSS. in chronological order (lent by Mr. and Mrs. Severn), whilst the opposite wall is completely covered with pictures, very large lecture diagrams, and details for the “Stones of Venice.”

Mr. W. G. Collingwood, as chairman of the building committee of the museum, asked Canon Rawnsley to publicly open the museum. Since they had lost John Ruskin he was sure that Canon Rawnsley was undoubtedly the most distinguished literary man of the Lake District. He hoped that in time to come they would have a much larger memorial than the present little Ruskin Museum.

Canon Rawnsley said:—We meet to-day to set the crown of completion on a work dear to the heart of John Ruskin and his friends, the Severns, Mr. W. G. Collingwood, and to the people of Coniston, and to all who believe we are bound to make the rural life of Britons higher and happier. This Institute is the result of a seven years’ effort to make the club-house of Coniston as perfect as may be. It has all the conveniences of a first-rate village club, billiard-room, classroom, news-room, concert hall, smoking-room, bath and caretaker’s house. Now, to-day has to be added what may be called a village study, a room where talk will give way to thought and work, and where any members of the club may find objects of interest to look at, books to read and ponder over, and facilities for drawing with pen and pencil; and all this in perfect quietness. It is true that students must run the risk of being disturbed a little in the summer holiday season. Then, I am told, by the fashionable penny-in-the-slot arrangement, an inquisitive public will be able to pass a turnstile and either examine the library, collection of minerals, Ruskin relics, engravings, pictures and portraits, and such objects of local archæological interest as may from time to time be collected. The committee will wish me, I am sure, to especially thank Mr. Collingwood, for he has never slackened his efforts to help the Coniston Institute from the day of its inception till now. This is the crown of his labour and rejoicing. But Mr. and Mrs. Arthur Severn and the president, Dr. Kendall, and the local committee had another reason for rejoicing with him. They have obtained their object to-day without leaving any liability upon the premises, and the Coniston village study, or as it will be better known in future, the Ruskin Museum, is open to-day to the public without a penny of debt to cast a shadow on the undertaking. Yet there is a shadow upon us all. He who knew this valley off and on for more than seventy years, as a little lad of thirteen could not think of the foaming of the White Lady Ghyll or the loneliness of Coniston Crags without breaking into boyish verse, and telling us how he wearied to see them again. He who, when he was ill at Matlock in 1871, was heard to say, as Mrs. Severn has told me, “If only I could be down beneath the crags of Coniston,” is laid—or so much of him as is mortal is laid—now for ever at rest beneath the hills of the valley he so loved and so honoured by his love. Even as I speak I see in thought the beautiful memorial cross that tells us of his labour and his rest from labour in the quiet God’s acre of this village of his care. For friends John Ruskin did care intensely; for the well-being of this village community, he took great interest in this Institute; backed up loyally by Mr. and Mrs. A. Severn, and by the willing hands and heart of Mr. Collingwood, he assured the success of the Institute in its infancy, and foreshadowed its educational value

by presenting it with a fine collection of mineralogical specimens, and by commissioning Mr. Collingwood to make a model to scale of Coniston Old Man and the adjacent hills. Then, in 1896, when the committee of the Institute determined to lengthen their cords and widen the bounds of their habitation, he contributed to a sale of work many sketches and signed drawings which materially added to the proceeds. May we not speak of him almost as the father of the Institute? Can we doubt but that to-day, if his spirit is with us, he is in sincere sympathy with the undertaking? This kind, just and true man was ever, as he told us, a lover of order, labour and peace, and anyone who saw him, as I used to see him, in the museum and drawing school at Oxford, or as others have seen him in the St. George's Museum at Sheffield, knows well how much he felt that in a true order of things the labourer in the fields or city workshops ought to be able to come to such king's treasure as a library and museum, and there, out of those treasures, bring forth peace—peace of a mind that comes of communing with the kings who are at peace—the mighty minds of old. How much he believed in the opening of the mind to higher things that such museums and libraries, rightfully used, would insure we know who have read his book "Sesame and Lilies." Nothing could be more consummate with his wishes than that here, in the valley of his labour and his rest, residents and villagers alike should have access to such a library and museum as the founders of this memorial to his name have designed for posterity. There could be no fitter monument to the master's memory than this Ruskin Museum. It is true that no one had greater scorn than Ruskin for the way in which we slay the prophets and then build their sepulchres. None desired more sincerely only to leave his memorial in the hearts of his followers. "Careless of monument by the grave," he once wrote, "the desire of men should be to build it in the world—monument by which men may be brought to remember not where we die but where we live." All his life was an attempt to build such a living memorial. He ever practised the truth he taught, and amongst others he taught the great reciprocal duties between the living and the dead. He believed in the to-morrow as he worked for the to-day. "We, as we live and work," he said, "are to be always thinking of those who are to come afterwards, and what we do may be serviceable as far as we can make it for them, as well as for ourselves." Then when we die it is the duty of those who come after us to accept this work of ours with thanks and remembrance, and not thrusting it aside and tearing it down the moment they think they have no use for it. Then," he added, "each generation will only be happy and powerful to the pitch it ought to be in fulfilling these duties to the past and future." To-day we are acting in the spirit of the man who so taught us. It is with sincere thanks and heartfelt labour of love for the people, not of Coniston only, but of Great Britain and the world, that here in Ruskin's name we are gathered to-day—whilst it is called to-day—to open this museum, which will help those who come after us, and shall keep his name in sweet and constant remembrance. We gladly accept the invitation of your committee to come over to you and to declare, as I do, this Ruskin Museum open.

NORHAM CASTLE.

THE fourth annual meeting of the present season of the Architectural and Archaeological Society of Northumberland and Durham was held at Norham. Sir Hubert Jerminham, K.C.M.G., in his excellent account of the castle, says that "few places in England can boast of more historical importance than Norham, for actually and incidentally it was the means of producing events, the benefits of which are felt to the present day. Christianity's first introduction into the North of England took place in Northumberland."

An invigorating drive from Berwick through undulating country and pretty scenery brought the visitors to Ladykirk, where the journey was broken, says the *Durham Advertiser*, with the object of giving the visitors an opportunity of inspecting the church, the interesting features of which were described by the minister, the Rev. W. Dobie. The first feature to which he directed the visitors' attention was an antique chest, upon which is carved "Liverpoole." Attached to it is a most peculiar history. It seems to have been originally in the parish church of St. Nicholas, Liverpool. It was bought at a public sale in Edinburgh, paid for and subsequently placed here. It was computed that it was 450 years old. How it got out of St. Nicholas's Church was quite a mystery to the churchwardens. It is, nevertheless, a very remarkable work, and a unique example of art. Some people, remarked the minister, thought that it was originally intended to be used as an alms chest, and force is lent to this suggestion by the scriptural quotation carved upon it, "It is more blessed to give than to receive." In regard to the church itself, continued the minister, there could be no hesitation in accepting the belief given expression

to in the Exchequer rolls of Edinburgh that James IV. contributed largely to the building of that church. At that time the state of the country was such that many buildings were begun and not completed. That church shared that fate. It stood till 1743, and having endured for so many years without any attention being devoted to its repair, it fell practically into a state of ruin. In 1742 or 1743, however, the property of Ladykirk changed hands. William Robertson, who was a well-known man in Edinburgh—a lawyer—purchased the property of Ladykirk, and, with an adjoining proprietor, put their heads and purses together and put it into a certain state of repair, although not into the state which it now enjoyed. The tower, they would notice, was comparatively modern. That was done in 1743. The population was then small and the church much too large. Therefore, instead of building a new parish school, as they were bound to do, they cut off a portion of the church by two partitions and made a Sunday school. He (the speaker) went there in 1859, and one evening he was sitting talking to the late David Robertson. The latter said, "I understand, Mr. Dobie, your manse is in very bad order." "Yes," the speaker replied, "it is." "Very well, we will have that put right." "But," retorted Mr. Dobie, "I don't mind the manse so much; I want my church." "What do you mean?" said Mr. Robertson. "Well," he said, "you have the parish school in it, and you have no right to have it there." There was, explained Mr. Dobie, an old law in Scotland that did not allow the two to be together. "After that I got my church," said Mr. Dobie triumphantly. They cleared out the seats and everything else, and it was done at no little expense, but without the slightest murmur or grumble from any human being. And now there they were; but, he added regretfully, with a decreasing population, for it is little more than one-half of what it was when he came there. By James IV. having contributed to the building of it they claimed that it had a large element of Royalty about it, but they were all sorry he had not the presence of mind to endow it. Referring to a bust of James IV., the minister remarked that it was made by Hanson Ritchie, a well-known sculptor. He executed a great many similar things both in England and Scotland. There were three cherubs upon the bust, which were, it was thought by many, representatives of Faith, Hope and Charity.

The party then inspected the old and interesting edifice. The unique stone roof of the church was duly remarked upon. It is said that the church of Ladykirk was built by James IV. in fulfilment of a vow made when in imminent danger of being drowned in the Tweed.

The brakes were now re-entered, and a pleasant drive was taken to Norham, at which place the twelfth-century church dedicated to St. Cuthbert, which contains some very fine pre-Conquest stones, was inspected. Here Canon Greenwell mounted the pulpit and discoursed racyly about the history of the building, and related many interesting stories regarding ancient charters. The church was built by Bishop Flambard, probably about the same time as the castle. Much of the Norman work, however, was destroyed during the restorations which took place in 1617, 1846 and 1852. Still, there are sufficient remains of the fine old building to indicate its architectural character. These are:—The round-headed arches between the nave and the south aisle with their tall cylindrical columns, the stately chancel arch with its three shafted piers, and the five round-headed and deeply-splayed arches in the south wall of the chancel, connected by the continuous label carved with zigzag. The aisles, vestry and tower are modern. The church contains two beautiful recessed and canopied tombs, one on the south and the other on the north side of the chancel. The former is of exquisite fourteenth-century workmanship, and supports on its slab the cross-legged effigy of a knight clad in mail. The bell in the tower is inscribed, "Anthony Bartlet made me 1670." The black oak fittings and reredos are from Durham Cathedral. Apart from its connection with the introduction of Christianity into England, the church is a magnificent specimen of early architecture. Mr. C. C. Hodges succeeded Canon Greenwell, and gave a long account of the architecture and other features of interest.

The party then walked to the castle, where they were received by Sir Hubert Jerminham. On behalf of Lady Jerminham and himself, he said, he extended to them all a most cordial welcome. He had no doubt they would be interested in all that had been said about that really historical place. It was, he continued, hardly finished in 1601. As they all knew, the marriage of Henry VII.'s daughter with James IV. of Scotland brought about virtually the union of Scotland and England, although that union, it was true, was not ratified until 100 years later. It was the affray at the gates of that castle that brought about that particular and most providential union between the fighting Scots on the one hand and the fighting Englishmen on the other. Then, between 1124—when that castle was nearly finished, namely, the Norman portion of it—and the year 1557, and later when Flodden finished the power of the Scots, it was there on his way to Berwick that King James

rested awhile. Those facts, and many more, made that place of peculiar historical interest. It was nothing else but a fortress, a fortress conceived by Bishop Flambard, continued by Bishop Pudsey, and finished by Anthony Bek. It was, therefore, very fitting that another Bishop of Durham should go to Melrose later and promulgate peace instead of war. Perhaps the most interesting feature of that place was that it was at that particular spot where the introduction of Christianity into the north part of England took place. After dealing further with the history of the castle, Sir Hubert said he thought they would find that a tour round would not make that an uninteresting excursion. He was glad to see Canon Greenwell present.

Sir Hubert then personally conducted the party round the castle, explaining its wonderful and remarkable history. Through his kindness and generosity each of the party was made the possessor of an abbreviated account of his history of Norham Castle.

TESSERÆ.

Roman Architecture.

IN the entablature of the portico of the Pantheon and in the upper cornice on the cylinder of masonry there is a feature which is new, though not of Roman origin. To enable the cornice to project further and obtain the effect of a great overhanging mass, and yet let it appear supported from below, brackets are placed under the projecting part. They are horizontal stones formed like fascias and twisted in opposite directions at the two ends; an acanthus leaf turning outwards runs along the under side. But in some cases, as in the Temple of the Dioscuri, the architect was not satisfied with this additional ornament as it is found on the cornice of the Pantheon, and has added Ionic dentils and a peculiar leaf ornamentation. There was an incessant effort to pile on ornaments in order to heighten the impression of wealth and magnificence, and the Composite capital which arose in Rome bears witness to this. The Roman architects were not content with the light volutes of stems and tendrils of the Corinthian column, but imposed upon the light foliage the heavy volutes of the Ionic order, placing them at all four sides in the direction of the diagonals. The entablature matched the Composite order in magnificence; all possible forms of ornament, beadings, moulding, dentils, &c., were piled on. The frieze was covered with a fantastic design of twisting branches and winged cupids, and the lower side of the projecting cornice was ornamented with brackets, cassettes and floral ornaments. There was often a superabundance of ornament, but the remains show that very fine effects were produced.

Historical Painting.

The illustration of history has ever been justly regarded as one of the loftiest objects of the art of painting, inasmuch as the records of nations are capable of arousing a wider interest than the habits of individuals. Though in the power of explaining, as it were, simultaneously the cause that led to the event and its subsequent results, the author has a great advantage over the painter; yet in the strength of its expression and in the clearness and perfect intelligibility of its language the art of painting far surpasses every other art. It may be said that a spectator standing before a picture which illustrates some event of history should be acquainted with the subject depicted, and though it would undoubtedly produce a greater interest if he could know not only the names of the actors, but also the cause and effect of the event depicted, yet such knowledge is not absolutely essential to arrive at a complete understanding of the character of the subject portrayed, provided it be one fit for pictorial illustration. Moreover, though in its highest flights art addresses itself to a more refined but naturally a smaller audience, it is surely not too much to expect that all classes, except the utterly ignorant, should be acquainted not only with the history of their country, but also to a certain extent with its poetry. Again, when literature has expended all its powers, there is a further eloquence which painting alone can utter, for it gives form and colour to the idea, and makes that a reality which before was only a vague dream.

The Peutingerian Road Map.

The map on parchment, showing the roads of the ancient Roman empire, which is in the Imperial Library, Vienna, is 21 feet in length and about 1 foot wide. The author, whoever he was, did not intend to draw a proper geographical map, with the relative position of countries, but merely to collect all the great roads of the empire into a long narrow strip, marking the stations upon each, and the distances between the stations, for the information of travellers and chiefly of military and civil officers. In consequence of this arrangement the great lines of roads are represented as nearly parallel, and most of the great rivers are also made to run in the same direction, from west to east or east to west, which was that of the greatest

length of the Roman empire. But the northern and southern boundaries of the empire are brought into close approximation to each other, without any regard to the latitude. For the same reason the Mediterranean, Adriatic, Ægean and Euxine seas are all compressed in breadth into the shape of long channels, the peninsula of Italy appears to run straight from west to east, and the islands, such as Sicily, have undergone a like compression of form. The towns on the roads are marked by small houses; some, being worthy of particular notice, are designated by square buildings, like barracks, and some more important towns and military stations, such as Aquileia, Ravenna, &c., are distinguished by walls and towers. Rome is distinguished by a circle with a crowned figure seated in the middle, and the port of Trajan is conspicuously sketched near the right bank of the Tiber, at the mouth of the river. Constantinople is marked by a circle and a figure, which, however, is not crowned. Antioch is the only other city which is also distinguished by a circle and a figure, in which last Mannert thinks that he recognises the Virgin Mary, which he believes to be an interpolation of some copyist of the Middle Ages, who had before him an older map of the time of the Pagan emperors. That the original map was drawn while the old religion of the empire was still dominant seems proved by the heathen temples which are marked upon it, whilst there is no Christian name, with the exception of St. Peter's at Rome, which is probably also an interpolation of the copyist, who has taken care to notice the desert between the Red Sea and Palestine as being that "in which the children of Israel wandered for forty years," as well as Mount Sinai, where "they received the law." Several other particulars on the map seem to fix the date of its original construction to about the time of Alexander Severus, after the Persians had overthrown the Parthian dominion A.D. 226.

Colour in Architecture.

Remains of colour have been found by travellers upon ornamental work in most of the architectural ruins of Greece. Many traces were discovered by Dodwell, Stuart, Chandler, Brøndsted, Semper and others upon the principal Athenian monuments, upon the Temple of Theseus, the Parthenon, the Propylæa, the Erechtheum, the temple on the Ilissus, the monument of Lysicrates, the outer propylæa of the Temple of Ceres at Eleusis, and the greater temple at Rhamnus; also upon the Temple of Apollo at Bassæ in Arcadia, the Doric ruins at Corinth, and the Temple of Minerva in Ægina, upon the temples of Selinus in Sicily, and upon the basilica at Pæstum. Upon all these temples, except the Doric ruins at Corinth and the Temple of Minerva in Ægina (commonly called the Temple of Zeus Panhellenius), which were not of marble, the colouring was confined to the mouldings and other ornaments, the friezes, the metopes and the tympana of the pediments. The exterior of the wall of the cella of the Temple of Ægina and the columns of the Corinthian temple were covered with a stucco and coloured red. In a ruder age, when most temples were constructed of wood, before the use of marble or other stone, the application of colours was undoubtedly more general and much less systematic not only among the Greeks, but with most of the nations of antiquity. In Egypt it was at all times a universal custom to have recourse to colours in the decoration of architecture. In later times amongst the Romans in the times of Vitruvius and Pliny, the practice seems to have degenerated into a mere taste for gaudy colours, and to have been very general, as we see in the ruins of Pompeii, where, however, occasionally the arabesque decorations upon the walls of the courts in the larger houses are very elegant. With regard to the system of decorating the mouldings it appears, from the traces found upon ancient monuments, that they were painted in various ways and in a great variety of colours, whether carved or plain, and a tasteful combination of colours must have greatly heightened the effect of even the richest mouldings. These decorations were not confined to the mouldings of the entablature; the ovolo, echinus and abacus of the capital, and the toruses of the base were also sometimes coloured. Foliage, ova and beads were the ordinary decorations, but on the Doric tænia a fret was generally painted, and the cymatia of the pediment cornices were frequently ornamented with gilded metalwork; the acroteria were also surmounted with gilded figures. Upon the larger mouldings, on which foliage was painted, the outlines of the leaves were engraved in the stone. The mutules, dentils, modillions and the soffits were also variously coloured, but the Doric guttæ were apparently generally gilded. The fasciæ of the architraves and the coronæ of the cornices were left plain, but the Doric architrave was sometimes ornamented with gilded shields, as in the Parthenon at Athens, which were placed immediately beneath the metopes. It appears that all friezes which were decorated with sculpture were coloured, which was absolutely necessary to give the sculpture a proper relief; for the same reason the tympana of the pediments would also require colour. In the Doric order the tympanum would necessarily be of the same

colour as the metopes; in the Parthenon they were of a pale blue, and in some of the Sicilian monuments red has been found. The metopes require colour, with or without sculpture, to throw the weight of the pediment upon the triglyphs, its natural supporters, which, being left plain, united the cornice with the architrave and gave the whole building an elegant lightness of effect which it otherwise could not have.

Imagination and Taste.

Imagination seems to be a power to which instruction can scarcely reach, and if in any degree amenable to direction it can only be so through taste, a faculty that is admitted to be capable of much improvement by cultivation. By taste, in its most perfect condition, is understood a result from the union of the best sense with the most perfect senses and the truest sensibility. It includes a knowledge and love of the good as well as of the beautiful, for material beauty can never be truly felt but by him who knows also what is moral beauty. Imagination may be considered as the active power of genius, taste as the controlling and directing power. It is the temperance which Shakespeare recommended to the actors in their bursts of passion, but, as he also told them, it is not tameness, neither is it mere fastidiousness, much less timidity. It will dare everything for a great end, but it never seeks merely to astonish, nor is it ever presumptuous. It is a power that estimates all things, relatively as well as singly, and therefore it is not exclusive; it objects not to ugliness nor deformity, but it assigns to them their proper places. It objects only to falsehood, and this it detects as readily under the most magnificent disguises as when it affects the most childlike simplicity.

Edington Church, Wilts.

The date at which the Perpendicular style came into general use was the year 1377, or perhaps a little earlier. But as was the case with the previous styles, the sign of transition—in this case the Perpendicular line—had appeared some years before. The earliest instance known of a Transitional church is the very remarkable church of Edington, in Wilts, which was consecrated in 1361. It was built by William de Edington, Bishop of Winchester, and some have supposed that his successor in that see, the famous William of Wykeham, taking the idea from Edington's innovations, invented the Perpendicular style. Whether this theory be true or not, of this much at least we are certain, that Wykeham was the greatest architect of his day, and that his own foundation of New College is the earliest pure building of the style. It was begun in 1380 and finished in 1386. But to return to the church of Edington. It is Transitional throughout—not merely showing signs of a change here and there, but begun and finished within the period of transition—in general design and effect Decorated—in detail a remarkable mixture of the two styles between which it stands midway. For instance, the west window, which is large and of eight lights, appears at a distance to contain Decorated tracery, and the Perpendicular lines are scarcely noticed though they occur at every opening. This is probably accounted for partly by the fact that not one of the mullions is carried up into the head of the window, and thus the Perpendicular lines being broken and scattered the idea of perpendicularity is only imperfectly expressed. The doorway beneath exhibits a still more singular mixture of styles. The arch is segmental as in ordinary Decorated work, but the upper part, forming a kind of tympanum over two doors, is filled with Perpendicular panelling, and the whole is surmounted by a square hood moulding, which is of very unusual occurrence in Decorated work, though a similar example occurs in the north aisle of Dorchester Abbey Church. William de Edington began and Wykeham continued the alteration of Winchester Cathedral, and although the new works are, of course, in the Perpendicular style, at least those of the former prelate are not wholly free from traces of the preceding style. In 1380, however, we find the new style thoroughly established and the flowing line of the Decorated period utterly abandoned.

GENERAL.

The Rev. E. Lewes Cutts died on Tuesday in his seventy-eighth year. He was an ardent archaeologist and was the author of several books, including "Manual of Sepulchral Slabs and Crosses," "Scenes and Characters of the Middle Ages," "Early Christian Art," "Parish Priests and their People in the Middle Ages," &c. He also contributed the volume on Colchester to the "Historic Towns" series.

The Spanish Exhibition at the Guildhall was visited by 305,000 people during the four months it was open.

A Cross 60 feet high was unveiled last week on the summit of Monte Capreo, near Carpineto, the birthplace of Pope Leo XIII.

M. Loubet will present to the Empress of Russia as a souvenir of her visit to France a splendid Sèvres table-service, consisting of thirty articles representing dancing-girls in various attitudes.

Two Austrian Travellers who were sent to explore the ancient castles of Northern Arabia declare that the castle of Amra, 140 miles to the east of Jerusalem, contains the treasures of antiquity rumoured to be within its walls. The castle was erected before the Christian era, and has been uninhabited during the last 1,300 years.

The New Premises facing the St. Helens Town Hall which are in progress from the designs of Messrs. Briggs & Wolstenholme, who have arranged for the new buildings, will be in harmony with the front of the Gamble Institute. The walling will be of Ruabon brick, with terra-cotta dressings.

A New Theatre, to be called the Gaiety, is about to be erected in Tavistock Road, Plymouth, from the designs of Mr. H. J. Snell. Plans have been approved by the special works committee of the Corporation. It is expected the building will shortly be commenced. It will accommodate about 1,800 people.

The Manchester Corporation have decided to seek powers next year for the widening of Cross Street, in order that a double line of tramway may be laid for the whole of the street. At present there is a single line between King Street and Albert Square, and traffic is sometimes impeded in consequence.

The Old Benedictine Abbey at Luxeuil, which served as a seminary for priests, is to be sold by the French Government, the building and grounds being put up at 164,000 francs.

Bench Marks on Trees change very slightly, according to some notes by Mr. Geo. W. Cooley in the "Annual" of the Minnesota Surveyors and Engineers' Society. His experiments have lasted many years and were made with benches established in the usual way on linden, hickory, maple and elm trees. The changes are not cumulative. The greatest in sixteen years was about 0.02 foot, while an equal or perhaps greater variation occurs frequently in one year.

A New Organ is to be erected at the expense of the Chinese Government in the chapel at St. Augustine's College, Canterbury. The instrument is to be a memorial of the Rev. Sydney M. W. Brooks, formerly a student at St. Augustine's, who was killed in China last year.

Workmen's Compensation Cases, which have not been tried by the Court of Appeal since March last, will be reinstated in the list for the ensuing Michaelmas sittings, and it is expected that they will be heard by that tribunal at an early date after the reassembling of the courts on October 24.

The Bexhill Urban Council are to submit to competition the preparation of plans for the proposed isolation hospital. The successful competitor is to be rewarded with a paltry 25*l*.

A Deputation from Dover has gone to Berlin and has laid before the Kaiser a plan of the improvements which are being carried out at that port, with the object of having it made the place of call for the German Atlantic liners.

M. Léon J. B. Grandin, the French sculptor, whose works were often admired in the Salon, has expired at Versailles after the amputation of his right leg.

Mr. James Cowle, Government architect and surveyor, has died very suddenly at Douglas, Isle of Man. He designed most of the modern public buildings in the island, including the Tynwald Court and the Rolls Office. He held the office of diocesan surveyor ever since its establishment by the Dilapidations Act of 1879.

The Committee appointed to adjudicate on the designs sent in for the new offices for the engineering staff of the railway at Maritzburg have placed three in the following order of merit, and the prizes will be awarded accordingly:—First, Mr. Ernest J. Wellman ("Rocket"); second, Mr. William Lucas ("Forward"); third, Mr. Herbert Salomon ("Utility"). Nine designs were sent in.

The Local Government Board have after more than three months' delay sanctioned the application of the Cheltenham Town Council to raise 35,000*l*. for the erection of a town hall and assembly rooms.

A Church is to be erected for the new parish of Dethick, Lea and Holloway, from the designs of Mr. P. H. Currey, of Derby.

It is Proposed to build a church in Birmingham in connection with the Oratory as a memorial of Cardinal Newman. Plans have been prepared and the estimated cost is 23,000*l*.

An Inquiry has been held at Hayward's Heath into the application of the Rural District Council for sanction to borrow 6,500*l*. for the erection of a board-room and offices.

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

YORKS.—Sept. 11.—For construction of an open-air swimming-bath at Norton. Mr. William Botterill, clerk, Council Buildings, Norton, Malton.

A HANDSOME addition to the public school buildings has just been completed at Burntisland at a cost of 5,000*l.* The new building, which is erected on the playground of the old school, is in Gothic style, about 60 feet square, two storeys in height, and is designed to give simple, impressive dignity by the solid character of its masonry. On the ground floor are two large classrooms, manual instruction-room, furnished with carpenter's benches, cloak-rooms and lavatories. A mezzanine floor is utilised for head-master's private room, staff-room and store-room, and on the upper floor are three classrooms, lecture room and chemical laboratory, fully fitted and equipped. The classrooms are all for the higher standards and are well lighted. Heating and ventilation have had careful attention, and are on modern principles, the former by low-pressure hot water pipes, and the impure air is drawn upward by a flue and evaporates through an ornamental tower which surmounts the building. In lieu of the ground appropriated for the site, playgrounds for both schools have been excavated out of the hill at the rear. Though the building is already being used, the formal opening, which will be of a ceremonial character, will take place a month hence.

THE OXFORD.

MESSRS. WYLSON & LONG, theatre architects, have effected a great and pleasing change in the appearance of the Oxford Music Hall, which has been entirely redecorated without suspending the performances. Ivory and gold, with occasional touches of a delicate green, are the colours which predominate, with a liberal and discriminating use of artistically worked copper which is applied to dadoes, panels, columns, &c., with admirable results. These, together with the new upholstery of rich crimson velvet, handsome tableau curtains of brocaded satin of a similar shade, a shade which is also seen in the thick carpets, combine to produce an effect at once rich, cheerful and cosy. In addition to the decoration of the auditorium some important structural works have also been carried out. These include the enlargement of the stage, the construction of an additional exit into Hanway Street, a new stage entrance, new and very comfortable dressing-rooms admirably fitted, and a handsome new crush-room in the balcony.

ST. PETER'S CHURCH, Rock Ferry, was opened on Sunday, after having been closed for the past five weeks for interior decorations, which have been carried out by Messrs. G. H. Morton & Son, Liverpool. The church formerly presented a very dark and dreary appearance, and the decorators' aim has been to produce a much lighter scheme of decoration. The roof panels of the body of the church have been treated a cream colour, with a decorative moulding, chevron design, in blue and brown, and the whole of the woodwork has been treated as unpolished oak. The walls have been coloured an apricot hue, surmounted by a wide band or frieze of greenish vellum, ornamented by a symbolical powdering, and divided from the wall space by an ornamental border in chocolate and cream. The chancel has been richly decorated in warm apricot and green tones, the upper portion of the walls being enriched by elaborate diaper design in blended red tones, introducing symbolical ornaments based on the chalice and wheat ears. The lower portion of the wall is richly treated with powdered ornamentation in gold and olive green tones on a paler green ground. The ceiling panels have been treated a pale turquoise blue, and all mouldings are done in vellum tones enriched with gold. The whole of the works have been done under the supervision of Mr. G. H. Morton, M.S.A.

A NEW KITCHENER.

THE "ONE" kitchener, which has recently been put upon the market, possesses several new features which render it worthy of more than a passing glance.

The range is constructed with a firebrick dome and damper over the fire, which enables the heat to be concentrated either on the hot-plate or on the boiler, as may be required, the waste heat of either passing under the other, thereby utilising what is usually lost.

Hot water is, of course, wanted long after the hot-plate is done with for the day, and instead of unduly heating the atmosphere of the kitchen by keeping the hot-plate at a high temperature, the heat can be diverted and concentrated upon the circulating boiler.

Fig. 1 shows the kitchener standing independent. It is also made with covings, and is a self-setting range when placed up to the walls of an opening.

FIG. 1.

Fig. 2 shows the firebrick damper over the fire closed; also the damper into the main flue behind and under the

boiler, the heat passing under the boiler and over it, into the main flue through the damper shown opened.

FIG. 2.

Fig. 3 shows the firebrick damper open, and the concentrated heat of the fire playing upon the hot-plate; the waste heat then passing down and under the boiler, and then through the open damper into the main flue behind the boiler.

FIG. 3.

All the dampers are fixed to and revolve from the vertical spindle which engages with a small plug in the hot-plate, and is operated by means of a handle or poker provided for the purpose.

The large oven is constructed so that the heat of the fire passes directly under the bottom of it, and then up the side and over the top, and its position, raised a little above the ground floor, will, we think, be found convenient. The shallow oven below can also be used for roasting. The outside casing and oven door are lined with slag-wool, and the entire workmanship is of the best description.

NO HOUSE, OFFICE, or FACTORY SHOULD BE WITHOUT A RELIABLE & GERM-PROOF FILTER

Dr. ANDREW WILSON writes as follows:—"The filters sold by the Berkefeld Filter Co. Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (*i.e.* germless) water, and thus prevent typhoid fever and many other diseases."

SIMPLE IN CONSTRUCTION, MOST EASILY CLEANED

TRADE NOTES.

THE additions to the grammar school, Pontefract, are being warmed and ventilated by means of Shorlands' patent Manchester grates and patent extract ventilators.

THE Borough Technical school, Shrewsbury, has been fitted with the latest improved low-pressure hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, including their Rahnee radiators.

THE Cherry Tree Machine Co., Ltd., of Cherry Tree, near Blackburn, inform us that they have secured the contract for the new laundry machinery at the Ashton-under-Lyne workhouse, and have also received intimation that their tender for the laundry machinery for the Bromsgrove isolation hospital, Birmingham, has been accepted.

THE Pulsometer Engineering Company, Ltd., announce the removal of their works and offices from Nine Elms, S.W., to Nine Elms Ironworks, Reading, Berks, where all business communications should be addressed. They are, however, retaining their offices and showroom at 63 Queen Victoria Street, E.C.

A PREACHING CROSS has been erected in the churchyard of St. Mary's, Haggerston, in memory of the late Rev. George Wingate, a former vicar of the church. The cross, which is 15 feet in height, has four panels on the base, containing representations of the Nativity, the Crucifixion, the Good Shepherd and the Virgin and Child.

THE promoters of the Shields Bridge Bill, which was rejected by the House of Commons, have now under consideration a project to unite North and South Shields by means of a tunnel beneath the Tyne and an electric tram service.

ELECTRIC NOTES.

ELECTRIC street cars are in use in Kyoto and are constantly filled. They are, in fact, so well patronised by the working-classes that the wealthier people still employ the jinriksha to avoid the crowding. An electric line has been projected at Tokio and at Yokohama, but work has not yet begun.

It is anticipated that two additional electric-light generating stations will be required to supply electricity for the whole of the borough of Stepney. The main roads, which are to be supplied with the current next year, include the Mile End, Burdett and Commercial Roads, and Cable Street, St. George's.

THE inauguration of an extensive scheme of electric tramways in South Staffordshire, Worcestershire, and the Kinver district took place last Saturday. The British Electric Traction Company have now in the Black Country and adjacent districts upwards of 60 miles of tramways, the cost of which has been 1,500,000*l.*

FOR some considerable time past Crieff Town Council have had under consideration the advisability of lighting the town by electric light. At a recent committee meeting of the whole Board the convener of the lighting committee reported that a provisional order had now been obtained for the lighting of the town. After some discussion, the matter was delayed, in the meantime to consider whether the Council should undertake the work or if a company be advertised for to do so.

A SPECIAL meeting of Kilmarnock Town Council was held last week to consider a report in regard to the proposed scheme for electric lighting. Provost Mackay presided. The committee recommended the acceptance of offers amounting to 29,062*l.* 12*s.* for the erecting and fitting up of an electric station at Riccarton. Mr. Wilson moved the adoption of the report, which was seconded by Mr. Morton. Mr. Smith moved, as an amendment, that the matter be delayed until the engineer furnished a written statement of his reasons for recommending the adoption of the offers of certain firms. Mr. Burnett seconded. On a division the amendment was adopted by 12 votes to 10.

A COMPANY has been formed at Carrara for the purpose of constructing and operating an electric traction system between that town and Carrara di Marina, also for providing the town and community of Carrara with electric light and power for industrial purposes. The concession granted to the company

THE CUNDALL PATENT OIL ENGINE

COPY OF LETTER.

THE GREAT WESTERN HOTEL,

OBAN: October 29, 1900.

DEAR SIRS,—I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the most favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that my man can start it without any assistance. Most Oil Engines I have seen were difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,

ALEX. MCGREGOR.

R. CUNDALL & SONS, LTD. SHIPLEY, YORKS.

Paris Office—5 Rue Gozlin.

is for a term of fifty-two years. Carrara has a population of about 25,000, and is the centre of the Italian marble industry. The road at the outset will be some 3 miles in length.

At a meeting of the Inverness Town Council on the 2nd inst. a report on the electric lighting of the town was submitted by Mr. Jas. Fraser, C.E., Inverness. A scheme to have steam-power fell through last year. Mr. Fraser recommended a water-power scheme, with the Caledonian Canal as the source of supply, at a point immediately above the Muirton Wharf, where the Glasgow steamers are berthed. There is here a head of 40 feet. It is proposed to establish 600-horse power, with a tail race to the river Ness, through land mostly agricultural, and the cost, exclusive of electric plant, is estimated at about 15,000/. The engineer states that little or no current will be caused on the canal by drawing off the water, not more, at any rate, than a mile in eleven hours. An expert electric engineer is to be consulted.

VARIETIES.

THE dedication festival in connection with St. Barnabas's Roman Catholic Cathedral, Nottingham, was celebrated on the 25th ult.

By the King's orders the old stands at Ascot have been sold, and new ones are being erected at a cost of not less than 40,000/. A probability is hinted at there will be in future two Ascot meetings a year.

QUARNFORD CHURCH, in the Moorlands, six miles from Buxton, has been opened by the Bishop of Lichfield. The church, which replaces the old one, has cost 2,200/. The architect is Mr. W. R. Bryden, of Buxton.

A SMALL church was opened on the 31st ult. for public worship in the village of Calderbank, near Airdrie, in connection with the United Free Church Presbytery of Hamilton. The church is seated for 300 worshippers.

ST. THOMAS'S parish church, Marlborough Street, Dublin, was reopened on Sunday last for public worship, having been closed for the last two months for painting and general renovation.

THE Eccles Congregational church, which has been closed several weeks during an installation of the electric light and the redecoration of the building, has been reopened for public worship.

A NEW elementary school in connection with St. Ignatius Roman Catholic church, Wishaw, was formally opened on the 30th ult. The building, which is fitted with all modern appliances, provides accommodation for 500 scholars, and has been erected at a cost of 4,000/.

A NEW infants' school, which has been erected by the managers of the Hales Owen British schools upon land adjoining the old school, in order to meet the requirements of the Education Department, was opened by the Lord Mayor of Birmingham (Alderman S. Edwards) on the 4th inst. The cost of the extension is between 1,400/ and 1,500/, and additional accommodation will be found for 250 infants, bringing the total accommodation up to about 600 children, which it is expected will be sufficient for several years to come.

A NEW Congregational church was opened at Swinton, Yorks, on the 29th ult., having been built to seat about 500 persons, at a cost of 2,200/. It is of Early English style of architecture, and is constructed of Mexborough stone. The architects were Messrs. Hemsall & Patterson, of Sheffield, and the contractor Mr. M. N. Brown, of Mexborough. The building is situated in the centre of a township numbering 11,000 people, chiefly miners. A commodious Sunday school has existed for thirteen years, and the congregations have had services there. The first chapel was erected in 1823, but the accommodation for 150 was soon found to be inadequate.

THE members of the Wesleyan church, Lower Road, Deptford, have for a long time been anxious to see their building redecoration and renovated, but they are not a wealthy congregation, and funds therefore have not been forthcoming. A few weeks ago they resolved to overcome the difficulty by doing the work themselves, and so they have been busily engaged early in the morning, and sometimes up to midnight, in painting, whitewashing and colouring the interior of their meeting-house, at the same time not neglecting the work by which they earn their daily bread. The task is now practically accomplished and the chapel has been reopened. The sole expense was about 25/ for materials, even the scaffolding having been lent and erected free of cost.

THE Governors of the Worcester Dispensary and Provident Medical Institution have voted a sum of 600/ out of the funded property for the erection of a branch dispensary at Barbourne, the total cost of which will be 1,200/. This is the second branch dispensary started in the city, necessitated by the growth of the outlying suburbs. Further branches will be established in the near future as the funds are obtained.

P. A. GILBERT WOOD & CO. Lt.
6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS,
LONDON, E.C.

A TERRIBLE tragedy occurred last week at the limeworks of Messrs. Greaves, Bull & Lakin, Warwick. Thomas Edward Taylor, aged nine years, visited the limeworks at night, when he accidentally fell into the crushing mill. His piteous cries attracted the attention of a workman, but before he could be rescued he was frightfully mangled and crushed by the machinery, the body being pressed through a space of about 2 inches and ground to a pulp. Much sympathy is felt for the parents of the unfortunate lad.

THE Bridgegate new parish church, Glasgow, which was formally dedicated on the 10th ult., has been built of red sandstone from Locharbriggs Quarry, Dumfriesshire, from designs by Messrs. John Baird & James Thomson, architects, 88 Bath Street, Glasgow, and is in the Italian style of architecture. There are back and side galleries, and altogether it is seated for 700 people. One feature is the large choir platform, which will accommodate twenty-six people. Beneath the church there is a hall to hold about 400 people, and there are retiring-rooms and other necessary accommodation. The cost of the church, including site, will be about 6,000*l*.

THE first of a series of schools to educate the cripples of the Metropolis was opened at Essendine Road, Paddington, on the 2nd inst. Shortly after eight o'clock a well-made ambulance left the schools with a list of parents to call on who have crippled children, and they were conveyed to the school in company of a trained nurse, and by nine o'clock forty children were received. The cripples will not be taken home at mid-day, it being arranged that dinner will be provided them at the school, which will consist of two courses—soup, followed by meat, pudding and potatoes. After four o'clock the ambulance will again be ready to carry them home, and the driver will finish about 5.30. Another school on similar terms will be opened on Monday next at Mansford Street, Bethnal Green, and in the space of a few weeks others will be opened in the East, North and South of London.

MR. W. H. BAMBER offered for sale at the North Stafford Hotel, Stoke-on-Trent, on Tuesday, as a going concern the business, goodwill, trade marks, designs, fixtures, plant and raw material and other property connected with the china, earthenware and tileworks known as Minton's, Ltd, together with the lease of their three manufactories at Stoke-on-Trent and their London showrooms, offices and warehouses. The offer included the right to use the name of Minton's. The business was established in the year 1798, and the productions

of the firm have, of course, a reputation of the first order throughout the world. The concern is in full work, and, as Mr. Bamber told the company, it is seldom that a property such as this comes under the hammer of the auctioneers. One condition of the sale was that the business should not be removed from the present premises of the landlord without his written consent, but it was stated that arrangement might be made for acquiring the fee simple of the premises at Stoke. Another condition was that the purchaser should also purchase at valuation the stock-in-trade, &c., and this, in reply to a question, it was stated was at the last stock-taking returned at about 54,000*l*. The latter condition created some comment, and no offer being forthcoming a gentleman present stated that he would be prepared to make one if the condition referred to were withdrawn. Mr. Bamber, however, replied that they could not alter the condition, and the company dispersed without any bid having been made.

BUILDING AND BUILDERS.

THE Wandsworth Guardians have accepted a tender for 3,600*l*. for the erection of cottage homes for aged and deserving couples, on land adjoining the Tooting Homes.

THE Southend Corporation have decided to spend some 40,000*l*. on the improvement of the west front and the acquisition of a park in west ward.

THE memorial-stone of the new permanent Board school which is being erected in Lander Road, Sutherland, was laid on the 2nd inst. The new school will be a common brick building, with red stone facing.

THE foundation-stone of St. Peter's day schools, Wolverhampton, will be laid on Saturday, October 5. It is expected that the ceremony will be performed by the Earl of Dartmouth.

A SQUARE tower is being built on the south frontage of the Nicolson Institute, Stornoway. It shows a large moulded entrance doorway, which forms a vestibule to the building; also a number of triple and double moulded lancet openings on the four sides of the tower, the whole surmounted by a large public clock, which is placed nearly 60 feet from the ground level. When finished the tower will form quite a landmark for the district.

THAT Whitby is badly in want of a new bridge is abundantly proved by the fact, if it be as alleged, that orders to the

IMPORTANT NOTICE

To Shipowners, Shipbuilders, Contractors, House Builders and Painters, and others.

The Products specified below are unrivalled, and have only just been introduced into this country.

THOMAS TURNER & SON, LTD., QUARRY OWNERS, LIGHTCLIFFE, YORKS.

QUARRIES AT LIGHTCLIFFE, NORTHOWRAM, AND BRIGHOUSE.

amount of 100,000/ have been refused during the last few days by Whitby shipbuilders (Messrs. Thomas Turnbull & Son), this regrettable state of things being due to the narrowness of the present bridge.

WHILE engaged in assisting to take down the house No. 68 Broad Street, Aberdeen, which stands on part of the site required for University extension purposes, a labourer named John Jamieson (23) was struck by a flag pole, which fell upon him from a height of 22 feet. His head was badly injured, and he was removed in an unconscious condition to the Royal Infirmary.

THE foundation-stones of the first batch of cottage homes to be provided for Northumberland miners over sixty years of age who are unable to follow their employment have been laid at Broomhill Colliery, near Blyth. Earl Grey of Howick has given the site, and other landowners have also offered ground for sites for more cottages in other parts.

THE Rural District Council of Erpingham, Norfolk, having applied to the Local Government Board for sanction to borrow 4,200/ for works of sewage for the parish of Mundesley, an inquiry was held on the 28th ult. at the Board school there by Colonel A. J. Hepper, D.S.O., R.E., one of the Board's inspectors, into the subject-matter of the application. Evidence in support of the application having been given by Mr. T. Inglis Goldie, the District Council's engineer, and no opposition being offered, a vote of thanks to the inspector was proposed and carried. The latter then proceeded to visit the site of the works, and the inquiry ended.

ARRANGEMENTS have been completed for proceeding with the scheme for restoring Barton Church. Messrs. Oliver & Dodgshun, Carlisle, have advised the reroofing of the edifice, removing the ceiling and forming an open oak roof raised to the original pitch, removing colouring and plastering from pillars and walls and cementing the latter, removing the gallery, reglazing the windows, and altering the tower roof. For several years past the churchwardens have had to spend considerable sums annually on the repair of the roof. The estimated cost is 1,500/.

A MEETING of the governors of the Yardley Charity estates was held on Monday, the 2nd inst., at the offices of the clerk, Temple Row, Birmingham, Mr. W. H. Bulpitt presiding. The clerk (Mr. W. Fowler) reported that the Charity Commissioners had finally approved of the new scheme promoted by the governors for the erection of almshouses for women in the parish of Yardley, and it had been embodied in a provisional

order which had received the sanction of Parliament. The scheme provides for the erection of six almshouses for six alms-women and a residence for a nurse for the women, and the governors are empowered to expend 380/ a year on the administration and maintenance of the buildings, the pensions of the women and the salary of the nurse, as well as providing for medical attendance and appliances and the funeral expenses of the women.

THE new Chester Baths, which will be one of the most attractive features of the city, are nearing completion, and the formal opening by the mayor (Alderman H. T. Brown) will take place very shortly. The new building has a handsome exterior, and its construction has made a distinct improvement to the previously somewhat dingy neighbourhood of Union Street. There will be a new street communicating with the baths from Foregate Street, which will make them easily accessible from the most densely populated portion of the city. The gables of the building are becomingly constructed in the old black and white style so characteristic of Chester architecture. The large plunge bath is 75 feet long and 35 feet wide. The tank is lined with white glazed brick, the depth is graduated, and running above the dressing-rooms is a commodious gallery to accommodate the spectators of water polo and swimming matches. The first-class bath is not quite on the same big scale, but is still large enough, and the water for both will be taken from a main connected with the supply of the city. Both baths will be maintained at a tepid heat, and they will be kept open all winter if the number of patrons is found enough to justify the expense. There are a large number of slipper baths, which will be open all the year round. The architects are Messrs. Douglas & Minshull, of Chester.

THE CENTURY THEATRE.

THE Century Theatre, which under the auspices and supervision of Messrs. Ernest Rüntz & Co. has arisen on the site of that venerable home of melodrama, the Adelphi, may certainly claim to rank among the most elegant, commodious and comfortable theatres of the Metropolis.

The work of reconstruction is practically confined to the "front" of the house, the stage, which is considered to be one of the finest in the United Kingdom, having been to all intents and purposes left severely alone. In the auditorium, however,

GILBERT WOOD, Publisher, Imperial Buildings, Ludgate Circus

a surprising change has been wrought, and certainly none of its old patrons will recognise the theatre in its new guise. Roominess and a perfect sight line in all parts of the house have been the chief desiderata sought for, and most satisfactorily achieved.

The exterior has but little to show to indicate the change which has been effected within; the façade has, however, been extended westwards, and a handsome glazed shelter has been provided to protect "carriage folk" from the elements. This westward extension has enabled the architects to materially improve the entrance and the approaches to the various parts of the theatre, especially to the stalls, which are now gained by means of a wide and handsome subway, which leads from the main entrance to both sides of this portion of the house, in which seats are provided for 200 persons. The crush-room is a spacious, lofty and elegantly decorated hall, 33 feet long by 20 feet wide, from which the main staircase leads to the foyer and dress-circle (where are 170 seats), with its lounge and saloons. There are eight private boxes on the stalls and dress-circle level only, the seats in the upper circle, which accommodate 250, being continued right round to the proscenium opening, which is 30 feet by 31 feet, and the bold sweeping arch of which forms a striking feature. The pit is one of the largest in London, is lofty, well fitted and upholstered, and has a most comfortable refreshment saloon and excellent emergency exits; in fact, the arrangement of the entrances, and more especially the exits in case of panic, are a very special feature of the new building.

The patrons of the gallery are well looked after. Here, as in every part of the house, every seat commands an uninterrupted view of the stage.

The decoration is carried out in the Adams style, and the prevailing colour scheme is ivory white, yellow, old gold and electric blue, developed in silk, velvet and mural coverings and paintings, giving a sense of harmony and restfulness not only welcome, but unusual in so large a theatre. A beautiful Florentine frieze, of which the subject is "Love and Pleasure," surmounts the proscenium, and an elegant coved mosaic ceiling extends over the boxes, and every detail of the decorative work seems to blend and lend an air of brightness and yet repose, rather than garishness and glitter.

The furnishing, too, is of a luxurious description. Wilton carpets of electric blue cover the floors, and roomy seats, upholstered in yellow silk rep and velvet, are conspicuous in the best parts of the house. The upper circle is equal to most dress circles

so far as comfort is concerned, and the occupants of the pit and gallery are handsomely provided for.

The draperies to the boxes, which are most artistic and uncommon, were specially embroidered in Paris.

Fire appliances have been installed with liberality, and these include an asbestos curtain by Messrs. Merryweather & Sons. Heating is on the low-pressure system, radiators being placed throughout the building to warm the incoming air and so prevent draughts. The ventilation has also been carefully attended to by means of inlets and exhausts. There is a complete installation of electric light, with gas as a stand-by.

INTERNATIONAL ENGINEERING CONGRESS.

ON Tuesday the International Engineering Congress was opened in the University Buildings, Glasgow. There was a large attendance, including 200 delegates from abroad.

Mr. James Mansergh, who is acting-president, said that engineers constituted more than a profession—they amounted to a "race." There had been framed many definitions of engineering and of the engineer, but none adequate, and at the same time sufficiently exact and exclusive. An engineer might hold a diploma or he might not. He might be entitled to append a string of letters to his name, or he might not possess a single title to nominal distinction. That was because engineering did not consist in being, but in doing; for engineering was the only high art which depended as much on its cheapness for its excellence as upon any other item in the sum of achievement. There was an American definition of an engineer which stated that "he is a man who can do well for one dollar things that anybody could do somehow for double the money." A good deal of wasted ingenuity would be saved if those who engaged in every kind of engineering work would remember to use the money standard as well as the foot-rule and the higher mathematics. Real engineering must be mastered as it was realised on works in progress. It had no authoritative text-book. The engineer must cherish his ideals or he would sink into the routineer. He left as little as possible to chance, and, if wise, he would not rely upon his best mathematics any further than he could see them. An alarm had been sounded in their ears of late, warning them that the inhabitants of the United Kingdom had touched their high-water mark in respect to the prosperity derivable from the prosecution of those manufacturing industries which were based

upon engineering, or served by it with the means of transport and communication. This might be so. Our nation had no royal secret for arresting the revolution of fortune's wheel. The question of moment to Britishers was, Should we maintain our ground, to say nothing of increasing our lead? He could not tell. Brains were no peculiar possession of our nationality. Would the engineer in future flourish best in Britain or abroad? One heard much talk nowadays about the British need for technical education for workers, and of better instruction in the art of living for the people generally, and he was not disposed to disparage this desire for more light. He feared that only too good a case could be made out for the allegation that a mistaken statutory system had discouraged in this country upon the time being at least—the naturalisation and development of electrical engineering on the largest scale. Instead of the electrical and mechanical development of lighting and power plant being undertaken in this country upon a scale proportional to its early promise, the work had to be done by "sample," every small specimen differing from the others. Long years passed before any English engineer was in a position to give out an electrical power contract amounting to 100,000/. Meanwhile our friends in America and on the Continent of Europe were forging fast ahead. So we lost our chance, and should probably have to take other people's electrical plant for some time, instead of striking out our own leading line, as our less-governed forefathers did in railway work and shipbuilding years ago. He should like to remark how much of the real essence of economical engineering was contained in the work of settling standard sections of important constructive materials. This matter had been taken in hand by a joint committee of the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Naval Architects and the Iron and Steel Institute. Sir Benjamin Baker, with a specially selected sub-committee, had charge of bridge and general building construction; Sir John Barry, with similar assistance, of railways; Mr. Denny of shipbuilding, and Sir Douglas Fox of rolling-stock. In the hands of these eminent engineers the work would be well handled. The address concluded with brief references to some of the more prominent features of the work about to be carried out in the various sections of the congress.

In the section relating to gas Mr. George Livesey presided. He said that since gas ceased to hold the monopoly of light nearly thirty years ago, the advance and improvement in its manufacture and supply and its increased use have been

greater than ever. More especially during the past decade it had come very largely into use for cooking, heating, power and manufacturing processes. By means of the "slot meter" it has taken almost universal possession of workmen's dwellings, and by the Welsbach mantle it had distanced all competitors in the beauty and cheapness of its light. Its future rested with engineers even more than its past had done. The first and greatest need of the gas industry was the supply of men in the best sense of the word in all ranks to fill up vacancies and to occupy new ground, and technical schools did not produce the article; he sometimes thought they rather tended to check the development of manhood. Technical training would not save national industry, but men who loved work more than play and who would put their heart and soul into their work were the necessity of the age. It was not by the repetition of old designs and ideas that progress was made; they needed engineers who would look ahead, anticipate as far as possible public requirements and then bring all their skill to meet them. One of the greatest of public necessities was smokeless towns, and the gas engineer was the man to provide smokeless fuel—cheap, abundant, and suitable for all purposes. As was the engineer, so should be his helpers and subordinates if he was to do the best work. One of his most important qualifications was the ability to select and train his assistants of all grades down to the workman, who was very much what his employer made him. This duty of employers, who were the natural and proper leaders of their workmen, and should be their trusted friends, had been too much neglected, and both classes suffered from the neglect. The gas industry wanted freedom to do its best for both the public and itself; legislative restrictions should be removed, and the suppliers of gas left free to do their best to meet the needs of their customers.

Mr. W. E. Langdon, in addressing the electrical section, said that the question whether England, in comparison with other nations, was becoming retrograde in her industrial achievements must prove one of peculiar interest. There were grave reasons to fear that in some paths, especially in the more modern applications of science, and notably in the development of electricity, they had not retained that prominent position which had characterised this country for so long a period. Twenty years back British manufacture stood on level ground with other countries in the production of electrical machinery, yet, if they might judge by the following figures, it would appear that they had from some cause failed to meet even our home demands. From these figures, which were approximate

it appeared that of some 300,000 indicated horse-power of steam-engines laid down for lighting and traction, 73,000 had been imported from the United States of America; and that, of some 200,000 kilowatt capacity of generators, 71,000 were derived from the same source. It would be understood that that did not mean that the residue was British production. The capital invested in European countries and the United States in electric-lighting, power and traction works amounted to 367,000,000*l.* Of this sum the United States contributed 200,000,000*l.*, and Great Britain 35,000,000*l.* The number of miles of single track equipped for electric traction in the two countries was, relatively, 21,000 and 900; of motor-cars, 68,000 and 2,600. Germany, where the power employed for lighting work approached closely that of England, had 2,300 miles of track and 5,400 cars, although the invested capital was but 29 millions, as against England's 35 millions for an enormously less mileage and smaller equipment. The population of Great Britain was, approximately, 40,000,000, as against 70,000,000, that of the United States. The area in square miles was, relatively, 121,115, and 3,581,885. Too much stress must not be laid upon territorial comparison, although it would seem an evident corollary that the more dense the population the greater must be the demand for means of locomotion. These figures should, at all events, prove effectual in disposing of any doubt that electrical development was only at the beginning of its era, and that an enormous field lies before it in almost every path of commercial and social life. Two important factors—cost and promptitude of delivery—attended successful competition in manufacture. Cost depended much upon labour conditions. Within a very short period rivalry in manufacture would be far more acute than now was the case, and in it labour would play the chief part. The artisan should not lose sight of the fact that this question of cost was one which affected the employé as well as the employer. Until the employé could be induced to recognise in a practical manner the fact that his employer's interest was also his interest, those labour regulations which had been fruitful of so much harm to the manufacturing interests of this country, and which must in the end prove disastrous to the workman, would continue. We were speedily approaching a condition in the industrial progress of the world that would test to the utmost not merely our means of production and our skill, but our position as a nation. It behoved us to consider how our manufacturing industry was placed in relation to that of other countries with which we had

to compete; whether the conditions of production—labour, legislative enactments or other restrictions—were such as gave our rivals an initial advantage. We saw other countries prepared and preparing to take advantage of every new development in industrial progress. We saw vast sums of money embarked in the use and advancement of electricity in its various modes of application, and we saw that here in England we were indebted to a foreign source to meet a great portion of our wants. There was a cause, and if our country was to retain her rank as a nation it was necessary that this cause should be ascertained and removed ere it was too late. We had sternly to face the fact that manufacture was daily becoming cosmopolitan; that the production of a land must form its staple source of revenue; and in this sense to emphasise the need to consider those liabilities to which the British manufacturer had, in relation to the conditions attaining in other countries, to subscribe. The subject was one which might claim the most careful consideration of every branch of our legislative administration, our labour organisations, and of every citizen of the British Empire.

THE HOUSING QUESTION IN LEEDS.

THE Leeds Corporation must shortly decide what it will do in regard to the housing question. Its insanitary areas cover from 60 to 70 acres, and in the process of clearing some 16,000 people will be dispossessed. It is required in such a case that other habitations be provided.

The people turned out of condemned areas belong to the poorest class, and hence a difficult social problem presents itself. An old slum must not be replaced by a new one; sanitary, healthy dwellings must be erected, and the rents must be within the slender means of the disoused.

Who is going to supply the deficiency? asks the *Leeds Mercury*. This is not a case in which the Corporation can complacently rely upon private enterprise. Neither the philanthropist nor the ordinary speculator will probably be satisfied with the financial return. So far neither has shown a consuming desire to rush in. There are those who have seriously considered the matter, and who see no alternative to the local authority bearing its own burden in the matter.

Probably few people are better able to say what is practicable in such a case than Mr. John Hepper. He states that he

A. GILBERT WOOD & CO. Ltd, 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

has given considerable attention to the subject, and examined many schemes of the kind; that at the outset he was opposed to the Municipality engaging in the enterprise, but that on closer examination his views have undergone considerable modification. Looking at all the conditions, he has, in fact, become convinced that provision for the poor concerned must be made by the local authority.

Mr. Hepper has come to that conclusion, though he is aware that private enterprise is endeavouring to solve the problem. Mr. Robert Wood (of the firm of John Wood & Son, building contractors) has erected on a portion of the insanitary area dwellings of the class required. The locality is that between Marsh Lane and York Street, flanked by Duke Street and Brick Street. There Mr. Wood has erected a long block of flats.

Built of red pressed brick, the row is of three storeys, and comprises thirty-nine dwellings, or thirteen per storey. They are all through houses, but not of the same size. The larger contain a kitchen or living room 12 feet square, a bedroom of the same dimensions, a smaller bedroom 12 feet by 8 feet, a scullery, coal bunker and water-closet. The smaller have only one bedroom, otherwise they are the same as the larger.

The first and second floors are reached from the front street by stone stairs, and the occupants of these upper flats can exchange visits by way of the balconies which extend along the front. Shoots are provided for the conveyance of household refuse to a receptacle on the street level, which can readily be emptied. A fairly spacious yard is provided at the rear for the drying of clothes.

The property is substantially built and sanitary. In such a collection of dwellings more than ordinary precautions against fire are obviously desirable. The floors rest on concrete, and are fireproof. A good oven forms part of the kitchen range. There is in each dwelling, indeed, all that is necessary for the comfortable housing of a small family, and Mr. Wood is to be commended for his enlightened enterprise.

The question of paramount importance, however, is whether such dwellings are within the means of the tenants for whom provision must be made? As has been said, these belong to the poorest class, and the rents will be 5s. 3d. per week for the flats with two bedrooms and 4s. 3d. for those with one bedroom. Such rents will probably yield no more than a reasonable return on the sum invested, and considering the accommodation provided, they do not seem excessive. But the point is whether the poor can afford to pay them. Judging

from the number of applications which the landlord has already received, he will have little difficulty in letting the property, but it does not follow that the problem is solved as the result.

Mr. Wood has made his attempt under more favourable conditions than other private speculators might obtain. He purchased the land at 12s. 6d. per square yard, and the Corporation, who were the vendors, undertook, contrary to custom, to provide the ground for the surrounding streets, and to pave, flag and sewer them. A building scheme was also provided for him free of expense.

These were important concessions. Mr. Hepper computes that of the 12s. 6d. per square yard the Corporation would not receive more than 4s. 6d. The buyer in such a case generally pays not only for the site, but for the moieties of the streets, and also for the paving and flagging and one-third the cost of sewerage. This would mean (says Mr. Hepper) that if the land cost 7s. 6d. per yard the total cost (including buildings) would be from 23s. 6d. to 24s. per yard.

If suitable dwellings erected under comparatively favourable conditions must be let at the rents mentioned, what would be the rents under conditions which entailed a very much larger outlay? The answer seems plain. The poor could not afford to pay them.

As private enterprise would not build for a less return than could be obtained from other equally safe investments, and as dwellings must still be provided for the dispossessed poor, the Corporation will require to consider and determine how the obligation can be discharged. It is evidently a question, too, in which the ratepayers are deeply interested.

THE WIDENING OF LONDON BRIDGE.

PREPARATIONS, says the *City Press*, are being made for carrying out the work of widening London Bridge, an improvement which has been under discussion for a considerable time. Everyone realised that the bridge needed widening owing to the narrowness of the footways, but the work could not be undertaken until Parliament had given its approval. This it did during the last session. There have also been engineering difficulties in the way, as it was thought inadvisable to disturb to any great extent the foundations of the bridge by placing any largely increased weight upon them. The Act provides for an extension of the footways without any detriment to the artistic proportions of the bridge, as the outer edge will possess

a stone balustrade, solid work beneath being employed to give the necessary support to the extension. The roadway will be increased in width from 34 to 37 feet, and the footways from 9 to 14 feet. The increase in the width of the roadway will give facilities for the lighting of the bridge from the centre, where also refuges will be placed for the convenience of pedestrians. The widening of London Bridge will give the Bridge House Estates committee an opportunity of thoroughly draining it, as at present there are no gullies, except at each end of the structure. The present recesses, which are simply used by tramps as night harbours of refuge, will be swept away, while the solid parapet wall will give place to an elegant balustrade, through which much of the dust which now accumulates upon the bridge will escape into the river below. During the alterations the underneath side of the structure will be pointed wherever it is found defective, and the roadway will be repaved with granite. By this means the public will enjoy the benefit of an additional 6 feet width on each side, while at the same time the foundations of the structure will not be disturbed by the addition of any enormous weight. During the work of extension—which, it is expected, will take three years to complete—a temporary footbridge will be constructed on each side of the bridge to accommodate the traffic, the supports rising from the buttresses. The actual work of extension will commence in the course of a few months, by which time the temporary footways will be ready for use.

LIVING WATER FOR JERUSALEM.

MANY people, says a correspondent in Palestine of the *Times* will be interested to learn that at last an actual beginning has been made to bring a supply of living water into Jerusalem. The remains of ancient aqueducts and reservoirs testify to the abundant provision which the Holy City had when it flourished as the metropolis of the Jewish State. But it has now long been dependent on the scanty and often polluted accumulations of rain water from the terraces of different houses gathered in the rock-hewn cistern beneath them. When there is an abundant rainfall the cisterns are filled and yield a moderate supply. Even then, in the end of the summer, water becomes scarce, and there is annually no little distress from its lack, and much fever and other sicknesses caused by the use of the dregs of the cisterns. But in the event of a small rainfall

the distress is most acute, and begins early in the summer. The rainfall of the past season was only about 15 inches, which is but half the average of the past few years. In consequence there is already not only a dearth of water for household purposes, but the extensive building operations which form a chief source of employment to the artisans and labourers have had to be suspended, which has deprived thousands of employment.

For many years no little effort has been made by the rich and influential friends of Jerusalem, both Gentile and Jewish, to secure for it an adequate water supply. About thirty years ago General Sir Charles Warren, who was then making explorations here for the Palestine Exploration Fund, agitated the question, which resulted in Lady Burdett-Coutts offering the 50,000*l.* then said to be required to bring water from Ain Arroub, which is beyond Solomon's Pools and about 16 miles south of Jerusalem. The Turkish Government was unwilling to accept the offer on the conditions which accompanied it, which prevented the plan from being carried out. Likewise also, and for the same reason, the efforts of a London committee composed of friends of Jerusalem, who also have long had the needed amount in hand, were fruitless.

It is interesting to note the combination of circumstances which have contributed to bring about the work just now inaugurated. The first of these has been the insufficient rainfall of the past season and the fact that Jerusalem stood facing a water famine. Another factor has been the recent arrival of the new Governor of Jerusalem, His Excellency Mohammed Djavad Pasha, who found the municipality endeavouring to meet the emergency by having a daily supply of water for the poor brought in by the railroad company, to be sold at a small fixed price per skin. Of further help was the opportune presence in Jerusalem on a visit of Franghia Effendi, one of the Sultan's engineers, who suggested to the Governor the plan of at once laying a pipe to Jerusalem from Ain Salah, or the "Sealed Fountain," at Solomon's Pools, about nine miles south of the city, which could be accomplished in a month's time at a cost of 5,000*l.*, and would deliver about 8,000 skins every 24 hours.

There was in existence a fund or endowment, dating several centuries back, for giving Jerusalem a water-supply, the income of which has hitherto been diverted into other channels. On the Mohammedan feast of the birthday of the Prophet, the new Governor, in telegraphing his congratulations to His Imperial Majesty the Sultan, asked that the occasion

might be signalled by permission to appropriate from this fund the amount needed to bring in the water in the way mentioned. The reply was favourable, and on July 5, about five o'clock in the afternoon, the laying of the foundation-stone took place at the Pools of Solomon, in the presence of the civil and military pashas, the Mohammedan religious heads, and a number of other leading Turkish officials. Representatives of the Latin, Greek and other Jerusalem religious communities were invited, but the shortness of the notice prevented the attendance of several. The Pasha laid the corner-stone, and the traditional lambs were slaughtered and prayers were offered. The flesh of the two lambs was divided on the spot by the poor among themselves, according to custom.

The work thus begun is that of laying a pipe of 10 c. in diameter from the Sealed Fountain to Jerusalem. This fountain is supposed to be the work of Solomon, and to be alluded to in the Song of Solomon in the words, "My beloved is like a spring shut up, a fountain sealed." It is a deep-down subterranean spring, which has, from the time of Solomon, flowed through the arched tunnel built by him to the distributing chamber or reservoir near the north-west corner of the highest of Solomon's Pools. Half a century ago the location of this "hidden" spring, which was still, as in Solomon's time, flowing into the reservoir mentioned, was unknown. The tunnel is roofed by stones leaning against each other like an inverted V, the primitive form of the arch, which is also seen in the roof of the Queen's Chamber of the Great Pyramid. The entrance to this tunnel from the spring is one of the oldest structures in existence. The piping is to be laid along the old aqueduct which formerly, from the time of Solomon, brought this same water to the Temple area. It will require about 20,000 metres or 20 kilometres of piping, and several English and Continental firms have just been telegraphed to for offers to supply the piping required. The course of the aqueduct is down the valley in which Solomon's Pools are built. Just below the lower pool the waters of Ain Etam join and augment the flow from the Sealed Fountain. At a little distance further down the valley the beautiful site of the ancient Gardens of Solomon, watered from these pools, is passed. The planting of these gardens, as well as the building of the pools of water, is mentioned by Solomon in the book of Ecclesiastes. Here now is Artas, a village in the still well-watered and fruitful valley. Here also has just been erected a Roman Catholic convent, built by a South American bishop at a cost of 15,000*l.*, where the nuns of the order of the

Daughters of Solomon will conduct a school for Armenian Catholic orphans. Further on, the course of the aqueduct passes Bethlehem, and on northward past Tantour, where live the successors of the real order of the Knights of St. John, past Mar Elias, where Elijah is said to have rested in his flight from Jezebel, then it crosses the historic plain of Rephaim, where David, in the heat of the battle with the Philistines, longed for water from the well at Bethlehem, and finally, after passing around the slope of Zion, it enters the city through the grounds of the mosque of Omar, the old Temple area.

There are eleven or twelve ancient fountains here and there in the city, long unused, but now to be utilised, and from which the water may be drawn, free to all, several taps being attached to each fountain.

His Excellency Mohammed Djevad Pasha shows the keenest interest in this work, and is also making inquiries into the feasibility of bringing an additional supply of water from Beeroth, which name means "the place of wells," whence it is said water was brought in ancient times to Jerusalem. From this source, at a cost, it is said, of about 8,000*l.*, a supply of spring water, similar in quantity to that from the Sealed Fountain on the south, can be readily had.

Another work of interest is the successful repairing of the Virgin's Fount in the Valley of Jehoshaphat, just outside the city walls. This is a fountain of brackish water with a small intermittent flow. That is to say, after several hours' flow there occurs a short interval during which the water ceases. It is the only fountain which Jerusalem possesses. Its waters pass to the Pool of Siloam through a tunnel built by Hezekiah, as was recorded by his workmen on the rock-hewn wall of the tunnel in rude Hebrew, forming the oldest Hebrew inscription extant. A few years ago this inscription was surreptitiously cut out from its place and stolen, but was recovered by the Turkish authorities before it had been taken out of the country, and is now one of the most interesting objects in the Constantinople museum. About the same time efforts were made by blasting to increase the flow of water from the fountain, which resulted in a greatly diminished flow, and in its ceasing altogether in the summer months. Some Siloam villagers undertook to restore the spring to its former effectiveness, for which they were to receive from the municipality 100 napoleons if successful. They found and closed the breaks through which the water was lost, and it is now flowing as formerly, to the great joy of the Siloam people, whose chief source of supply it was.

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED.

PERFECTLY DUSTPROOF.

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass.

SUITABLE FOR ALL KINDS OF ROOFING,

Such as Weaving Sheds, Engineering Workshops, Railway Stations Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description

&c. &c.

This System allows for full expansion and contraction of glass and absorbs any vibration machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

ESTIMATES AND DETAIL DRAWINGS SUPPLIED ON APPLICATION.

AMERICAN MAPLE FLOORING

TONGUED, GROOVED, AND BORED FOR SECRET NAILING.

The Best & Cheapest Flooring yet Introduced

D. WITT & COMPANY, 168 TO 176 DRUMMOND STREET, EUSTON SQUARE, N.

The Architect.

THE WEEK.

THE annual general meeting of the Architectural Association will be held on October 11. The day school will open three days afterwards under the direction of Mr. A. T. BOLTON. The hours will be from 9.30 A.M. to 5 P.M., with an hour's interval at midday, except on Saturday, when the school will close at 1 P.M. The fee for the full course is 12 guineas per term, or 35 guineas per annum. The evening classes will also begin on October 14, when Mr. FARROW will lecture on "Formative Elements of English Architecture prior to the Norman Invasion," and Mr. SATCHELL on "Stone." The course of instruction is now remarkably comprehensive, and architectural students will be wise to profit by the opportunities which the Association can offer. At the ordinary meetings, commencing on November 1, the following papers will be read in succession:—"Cambridge in Early and Mediæval Times," by Mr. A. WOOD, M.A.; "The Sanitation of a Country House," by Mr. MAX CLARKE; "Capitals," by Mr. F. BOND, M.A.; "Travelling Students' Notes," by Mr. J. E. FORBES; "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century," by Mr. J. A. GOTCH; "Architectural and Constructional Engineering," by Mr. T. C. CUNNINGTON; "Originality in Architectural Design," by Mr. C. H. TOWNSEND; "A Plea for Women practising Architecture," by Miss ETHEL CHARLES; "The Glasgow Exhibition," by Mr. J. MILLAR; "The Dwellings erected at Port Sunlight and Thornton Hough," by Mr. W. H. LEVER; "The Preservation of Ancient Buildings," by Mr. W. D. CARÖE; "Arbitrations," by Mr. E. A. GRUNING; "Artisans' Dwellings from the Municipal Point of View," by Mr. O. FLEMING, and "Artisans' Dwellings from the Private Point of View," by Mr. L. AMBLER. The conversazione will be on October 25 and the supper on May 2.

THE interest in antiquity by which men are incited to undertake explorations has extended to Russian-Armenia. The Archimandrite CHATSCHIK, who belongs to a monastery known as Etschmiadsin, near the village of Wagarschapat in the province of Eriwan, had come to the conclusion that the renowned church which was erected in the seventh century by King NARSES III. must have existed in the vicinity. Excavations were commenced, and the ruins of a church which was about 120 feet in length were discovered. Evidently the exterior was decorated with arabesques cut in the stone, of which the vine was one of the elements. According to the legend, King NARSES built the church as a memorial of the Saint GREGORY who introduced Christianity in Armenia, and whose remains were employed as relics in the building. Bones have been found near the sites of the altars, which confirm the statement. From what has been revealed it is evident there was a clock tower at the south-eastern end of the church, on which was a stone dial. An inscription which was found among the ruins is believed to date from the seventh century. It is interesting to hear of archaeological researches in so remote a region, and the results should encourage the Russian Government to be more mindful of antiquity.

AN important arbitration case has been lately heard before Mr. GODFREY PINKERTON. It related to an action taken by the trustees of the estate of Mr. J. T. HOCKLEY, of Grantham, a builder, against Messrs. HENRY METCALF & T. R. GREIG, architects, London. A contract was entered into between the parties for the erection of Irema Mansions, South Kensington, which were to consist of flats. The amount to be paid was 25,762*l.* Before the work was completed the payments were not forthcoming, and the works were stopped. Mr. HOCKLEY therefore claimed payment for all work executed as well as damages for loss arising out of suspension of works. Messrs. METCALF & GREIG claimed 6,000*l.* damages for breach of contract, contending that

payment was made for all work done. The award of the arbitrator is to the following effect:—(1) The sum of 2,025*l.* 1*s.* 9*d.* was due from METCALF & GREIG in respect of the work executed by HOCKLEY, the value of which he fixed at 17,169*l.* 1*s.* 9*d.*; (2) that METCALF & GREIG should pay the sum of 764*l.* for loss incurred by HOCKLEY upon plant and material supplied on the contract; (3) that there was nothing due from HOCKLEY to METCALF & GREIG in respect of damages claimed by them; (4) that METCALF & GREIG should pay the costs of and incidental to the reference, and the costs of the award as between party and party; and (5) that there had been a breach of contract on the part of METCALF & GREIG, and that HOCKLEY was entitled to a sum of 1,183*l.* for loss of profit on the contract, the total sum under which HOCKLEY would have been entitled to be paid had he completed it, amounting to 9,000*l.* As regards the last item of the award, the arbitrator reserved a point of law, which is to be submitted in the form of a special case stated by the arbitrator to the High Court, as to whether on the facts stated therein HOCKLEY is entitled to be paid the sum representing the loss of profit, or any part of such sum, the costs of the special case to be left to the Court. The first part of the award will be enforceable forthwith.

ANALYSES of several examples of bronze found in the explorations at Nussar, the ancient Nippur of the Babylonians, have been made by Dr. HELM, of Dantzic. He has ascertained that the ancient founders employed in the production of bronze not only tin, but antimony. The preference for antimony he ascribes to the difficulty of obtaining tin in sufficient quantities for general use. The proportion of antimony is largest in the oldest examples. The copper required is supposed to have been derived either from the land of Kinash, or from Meluth in the north-west of Arabia. Two heads of gazelles of almost full size, which were probably produced five centuries prior to our era, and were found by Professor HILPRECHT, are evidence of the skill in the use of metals possessed by the ancient founders. The analysis demonstrated the existence of nickel in the copper. An example which was found near the wall of Nippur, and which may belong to the fourth century B.C., contained iron and antimony.

THE sewage problem has many phases, but the most remarkable is the proposal to introduce it as part of a university course. In India the first experiment is likely to be made. A project is under consideration for an Imperial Indian university which would be devoted to the development of post-graduate education. Professor WILLIAM RAMSAY, F.R.S., who has been asked to report on the subject, proposes that among the staff should be comprised a professor of industrial bacteriology and a chemist who is a sewage specialist. He gives sound reasons for the appointments:—"As a member of the English Royal Commission on Sewage Disposal, I have done my best to dissuade the public bodies of India, during my trip, from embarking on any untried scheme, or from initiating English methods of sewage disposal, without exhaustive experiments in India. The conditions as regards temperature, rainfall, the habits of the people, and possibly also the nature of the bacteria are so different in India from those which obtain in England, and the problem is itself so far from having reached a satisfactory solution in England and America, that it would be rash in the extreme to embark on any scheme of sewage disposal without a thorough investigation of all the methods on a moderate scale. The problem is a chemico-bacteriological one, and requires the co-operation of a chemist and a bacteriologist." Professor RAMSAY is correct when he refers to the unsatisfactory solutions of the problem which have to pass in England, and that may be owing to the indifference of men of high standing in science. If in India a successful process could be evolved, America and England would gladly be indebted to the discoverer.

FRENCH FORTIFIED CASTLES.*

THE reign of law is exemplified in France as in England by the substitution of non-fortified dwellings for those which were erected to withstand attacks by armed enemies. Another cause of the change was the improvement in the means of attack. A building that could resist an onslaught by men with bows and arrows would quickly succumb to a few cannon-balls, or at least an opening would soon be ready sufficiently wide to enable a party to enter within the building.

In France there were more residential fortifications than in England. The country was larger in area and it was more exposed to the influx of invaders. In the fourth century the Romans found it necessary not only to erect shelters for permanent garrisons, but to organise a fleet to defend northern Gaul against Saxon and other enemies. A castrum in Dijon is described by GREGORY of Tours as having thirty-three towers, of which the walls for a height of 20 feet were constructed of squared stones, and above that height of small stones; the thickness was 15 feet. The Gallo-Roman fortifications had sometimes very large blocks of dressed stone in the foundations, some being sculptured, which it is supposed were derived from temples and public buildings. According to LA SAUVAGÈRE, the walls of Saintes, near Cognac, when demolished were found to contain fragments of columns, capitals, entablatures, statues, reliefs, altars, &c. Happily the triumphal arch over the Charente and the remains of an amphitheatre survive to suggest the importance of Mediolanum Santonum before panic had seized the inhabitants.

The fear of invaders disorganised the whole country, and GUIZOT says that in the fifth century society could hardly be said to exist. The majority of the country houses were only fortifications on a small scale. Where possible a site was sought on the summit of an elevation, and places which were rocky and precipitous were most valued. As time went on people became less fearful of each other. The hordes of invaders were stemmed, or they became settlers. There is consequently no better evidence of the general amelioration than the permission given by CHARLEMAGNE to the bishops. By it they were allowed to take down the walls raised for military purposes and to use the materials in the erection of cathedrals and churches.

The Normans, however, made a revival of the fortified château a necessity. They were treated as enemies, and as the French king's power was of little use, all people who were wealthy depended for safety on such means as could be created by themselves. The privilege to fortify, which at first was only granted to nobles, was by them allowed under certain conditions to their vassals, and for a time every important house was a detached fort. It was then the feudal system was developed. In France, as in England, the type of castle adopted was a single plain building surrounded by earthworks, ditches and palisades. According to a French writer of the end of the eleventh century, it was impossible to reach the door of the citadel unless a temporary bridge was raised to the level of the sill.

In spite of all the romances, the inmates of a castle in the tenth or eleventh century must have led as uncomfortable an existence as would a modern gentleman if he were compelled to live in a factory chimney. The lowest stage had the advantage of allowing egress to ground outside, but the two or three storeys above were difficult to approach and difficult to leave. In the twelfth century more room was sought, but as the walls were still enormously thick, it was not always advisable to widen any of the faces of the structure. Thus an inscription on one circular tower or donjon records "my interior diameter at foot is 27 feet and the exterior 53 feet." With so much strength of masonry the donjon could be relied on as a final refuge. Consequently parts were added which were less massive but better adapted for residence in times of peace. Sometimes these parts were flanked by towers—an arrangement which had much to recommend it, and was, moreover, picturesque. In so important a building as the Bastille of Paris there were no less than eight semispherical towers, which were supplemented by wide and deep ditches. The Bastille could hardly, however, be considered as a type of the citadels of the feudal age. Château Gaillard, which is

said to have been erected under the direct superintendence of RICHARD I., possessed a citadel which was defended by no less than seventeen towers, which were segmental on plan.

The advance in civilisation during the thirteenth century was marked by a diminution of the eagerness to possess fortified dwellings. Attention was given to ecclesiastical rather than to military architecture. But those castles which were erected in France during the century were more important than their predecessors. The famed Château de Coucy is a thirteenth-century work, and with such a possession ENGUERRAND III. might well be arrogant and make PHILIP AUGUSTUS indisposed to meddle with his depredations.

With men like the lord of Coucy, to whom even the property of the Church was not sacred, there was always a risk of the invasion of towns. PHILIP AUGUSTUS, although supposed to be a powerful king, found it wise to enclose Paris with a wall for the protection of the citizens. The smaller towns sought a similar protection. The inhabitants paid either the whole or a part of the cost of the construction, as well as a tax for upholding the walls, but the money was well laid out, for the townsmen could live and work in more security than formerly. At Angiers, St. LOUIS paid for all the land required for the walls.

The Château de Josselin, of which we give a view this week, is one of the buildings which were erected at a time when flanking turrets were still in vogue. Various alterations and additions are to be seen in it. One part dates from the sixteenth century, and is of a less fortified character. The castle belonged to the ROHANS, and by marriage was inherited by OLIVIER DE CLISSON, who was Constable of France, and died in one of the chambers about 1407.

In the fourteenth century the necessity to live in fortresses was still powerful in some places. It was about 1390 Pierrefonds was raised, and although the original building may have differed in details from the restoration by VIOLLET-LE-DUC which we now see, the general effect at least must have been similar. It could not be considered a dwelling for a prince in peaceful times. Apprehension of an attack made the Duc d'ORLÉANS seek to have assurance doubly sure, for although the masonry was of a higher class than was usual in such structures, iron ties were introduced to strengthen the angles. As late as the seventeenth century Pierrefonds was supposed to be still a menace to royalty, for in 1617 RICHELIEU ordered its demolition, and in order to expedite the process the roofs were at once removed to admit the rain. The Bastille of Paris was another fourteenth-century erection.

In the fifteenth century the astute LOUIS XI. was inimical to the possession of strongholds by nobles. Restorations of ruins found little favour with him. Those which were erected in his reign would appear to have their character determined by his military officers. For the sake of the picturesque, or rather in order to uphold the reputation of the nobles, the castles were allowed to appear as inviolable, but the masonry was no longer of colossal thickness. In some cases brick was employed, but when seen arranged in patterns no illusion could make onlookers believe there was much danger in the walls, especially if artillery and firearms were adopted by the besiegers. The increase in the number of doors and windows was another sign that for feudalism gloomy days had arrived.

A BUILDING LAW FOR SYDNEY.

THE loyalty displayed by the Australian Britons during the whole of the South African war should secure for them the gratitude of the English people. That such a feeling is growing is evident from what has been said about the preference shown by the Westminster authorities for American timber as a paving for some of the metropolitan streets. A very few years ago Londoners in general were indifferent about the region from whence paving blocks were derived. It must also be admitted with compunction there was no desire to show any appreciation of Jarrah or other hard wood, although occasionally the qualities of the timber were brought under the consideration of town councils and urban councils. Timber merchants

* See Illustration.

in general believed Australia would never take the place of Northern Europe, and much was done to convince architects, engineers and contractors that the timber grown at the Antipodes could only be employed in exceptional cases where cost was not regarded. A different condition of opinion is now general. The decision of the Westminster Council is treated as if it were an affair of *haute politique*, and although through a single vote Australian timber was not selected, its qualities have been announced with a resounding force which has amazed experts. If a market is not created as a consequence of the praises the failure must be ascribed to bad management.

It is natural that Australians, when they learn about the changed disposition towards them which their brethren in Great Britain profess, should conclude there is a new era dawning for them. By forming a Federation they have, as it were, prepared the way for their coming prosperity. As a further sign we can see how Australian architects are suggesting their capacity to deal with any coming emergencies, and if towns are to be transformed, as will be often necessary with the increase of business now anticipated, there are architects and builders ready to undertake the operations. Sydney, as becomes the capital of so extensive a colony, is already dreaming of a change into streets of twenty-storey cloud-capped blocks, as if it were an American city.

There is, however, a serious obstacle which has to be overcome before building on an imperial scale can be commenced even on paper. It is the law. In Sydney, especially, there is also the difficulty of discovering where the obstacle is to be found. In English university towns it used to be hard to delimitate the powers of the representatives of the arts, and when the townsmen also acquired privileges the definition of the respective rights of the parties often appeared to be more puzzling than any problem offered by mathematicians. Cathedral cities have had a similar experience. Sydney has two controlling powers, the Legislature and the City Council, and each is considered to be omnipotent in whatever relates to building. Each also is tenacious of power, and jealous of any interference with its rights. In such a case what course should be followed by those who believe in the necessity of new building regulations for the regeneration of Sydney?

The architects are of opinion that the aid of the Government and the Legislature should be first invoked. The builders take the opposite view and maintain that it is a municipal question which is concerned; the first step should be to put the case before the Mayor and the City Council. The Secretary of the local Institute of Architects wrote to the Master Builders' Association, saying:—"I have been directed to say that in the opinion of this Council the Minister for Public Works is the proper authority to approach first of all, and we should be much more likely to obtain what we propose to ask for from him than, at the present time, from the Mayor. The Council therefore proposes that at the earliest date possible a small deputation of, say, two, or at the most three, from both of our Associations wait upon the Minister for Works, with a view to putting before him the joint opinions of the architects and the builders, as to the Building Act and its proposed amendments." The President of the Association, when the letter was read, said it was an example of the correspondence between the representatives of the architects and of the builders which had been passing for some months. But he held that the proper authority to invoke was the City Council. The Minister of Works appeared desirous to make a party question of the subject and stump the country with it. The Mayor and Council had been elected to control the city and should be allowed a fair trial. One speaker said no politician should be allowed to interfere with municipal government, for it would be a deprivation of citizens' rights. Other builders adopted a similar view, and finally the subject was left to the decision of the committee of the Association.

While the architects and builders are discussing who is to be approached for inspiration instead of defining what is required to be done in order to bring Sydney into a condition befitting its importance, the City Council are not indifferent. Reports have been ordered from officials who are qualified to give advice. In one matter the Council might be considered as already committed; that is, the height of buildings. A few years since instructions were given for

the preparation of a Bill on the subject. It was then contemplated to restrict the height of buildings within a margin of 15 feet greater than the width of streets, the limit being 75 feet, and that only for edifices facing streets 60 feet wide, squares or open spaces. Restrictions as to the number of storeys were also proposed. But with such visions of commerce as are now indulged in, buildings 75 feet high are supposed to be as ill-adapted to the requirements of the future as any of the two-storeyed offices which are to be seen in so many streets. There are occasions when nothing can be more inconsistent than consistency, and the City Council should change with the times. If the report of the City Building Surveyor can be considered as indicating the spirit of the Council at the present time there will be little opposition to high buildings. He says:—"Much has been said at different times regarding the restrictions as to the height of the buildings, but with reasonable limitations. I do not see why undue restrictions should be exercised, as, owing to the increasing land value, it becomes necessary to raise the height of the buildings so as to afford ample accommodation, and also to make a reasonable return upon the financial outlay as an investment. I may mention the London Building Act of 1894, in the tables for minimum thickness of walls, provides for buildings a height of 120 feet, and our City Improvement Act up to 100 feet height." It should be remembered that from its geographical position Sydney cannot be extended laterally in all directions. The harbour, quays and park place limitations on its expansion. The value of building sites has, besides, increased to such an extent, a return for outlay cannot be anticipated unless with many-storeyed buildings.

There are other important subjects besides the height of new buildings which necessitate the repeal of the majority of the existing regulations which date from 1879. The assumption of authority by the Legislature as well as by the City Council does not promote the safety of the public. The City Surveyor when dealing with theatres and places of public amusement finds himself hampered in his authority through the licenses granted by the Government. There is an absence in most of the buildings of means for a speedy exit, and of fire-resisting materials in stairs, floors, &c. Timber is exceptionally important in Sydney, but it is not prudent to allow the yards containing it to exist in the most crowded parts of the city. The shanties of the Chinese are no less risky. In a young State much allowance has to be made for the improvised structures of settlers. But care should be taken to prevent people from believing that flimsiness was to be always accepted. In Sydney the influence of the early habitations has continued. Writing in 1888 Mr. JOHN SULMAN, the architect, described the construction which was then general as follows:—"Our present mode of building is to run up brick or stone walls as thin as the Building Act will permit, fill the openings with wooden frames, form floors of inflammable Oregon joists, cover them with boards, ceil with wooden linings, cut them through from top to bottom for lifts cased in with wood, if cased at all, divide the rooms with wooden partitions, erect a wooden staircase, and finally cover all in with a wooden roof. What is this but a magnified match-box?"

In the years which have elapsed since those words were penned Sydney has not become less inflammable. It is time a change were made, and we hope no question of personal dignity, such as obeying the regulations of a Government office rather than those of a municipality, will prevent the Australian architects from co-operating in the production of a law which will put some check on the recurrence of fires in the Australian capital.

The Excavations on the site of the Abbey church, Canterbury, have been the means of the discovery of the skull and mitre of Abbot Dygon, who died in 1510. The body appeared to have been robed in full pontificals for burial, but owing presumably to the poverty of the monastery at that period of its history—the time of Henry VII.—the inmates were unable to give the abbot a real jewelled mitre or gold ring. The mitre found is of lead, with painted imitations of jewels; the episcopal ring on one of the fingers is also of base metal, and the chalice and paten are of lead.

HOLLINGBOURNE AND BEARSTED.*

THE pretty village of Hollingbourne, although very ancient, has lived a quiet life and has no historical events to boast of. The neighbourhood is one of great beauty. In the Norman Survey it is called Hollingeborde, and in later records Holingburnan and Hologeburne. Hasted says that it probably took its name from the spring which rises in the vale underneath the hill in the parish. The Rev. J. Cave-Browne, in his "Story of Hollingborne," states that the generally accepted origin of the name is that the abundance of hollies on the hillside gave the distinction to the burn (Saxon for stream) which runs through it, as the thorn and the box did to the neighbouring parishes of Thornham and Boxley.

The Manor.

Æthelstan Etheling, son of King Ethelred II., gave by his last will in 1015 to Christ Church in Canterbury his lands at Hollingbourne with their appurtenances, excepting one plowland, which he had given to Siserth. These lands he had bought of his father, and gave them, with his consent, to Christ Church, L.S.A., that is, free from all secular service, excepting the trinoda necessitas, in like manner as Adisham had been given to it. The manor remained part of the possessions of the church of Canterbury at the time of the Conquest, when the revenues of it were enjoyed as one common estate by the archbishop and his convent; but Archbishop Lanfranc, after the example of foreign churches, divided them into two portions, one of which he allotted for the maintenance of himself and his successors in the see of Canterbury, and the other for the monks for their subsistence, clothing and other necessary uses. In this partition Hollingbourne fell to the

GODFREY HOUSE, HOLLINGBOURNE.

share of the monks and was allotted for their subsistence, and it is accordingly entered in the book of Domesday under the general title of Terra Monachorum Archiepi—i.e. the land of the monks of the archbishop.

In Aithorde Hundred

The Archbishop himself holds Hologingeborde.

It was taxed at six sulings,

The arable land is 24 carucates.

In demesne there are two and 61 villeins

With 16 borderers, having 23 carucates.

There is a church, 12 servants, and two mills and eight acres of meadow.

Wood for the pannage of 40 hogs.

In the whole, in the time of King Edward the Confessor and afterwards, it was worth 20 pounds.

And now it is worth 30 pounds.

For this manor there adjoins half a suling, which never pays scot.

This the Bishop of Baieux rents of the Archbishop.

At this time the whole of the above premises seem to have been valued at 30*l*.

* A paper read by Mr. C. F. Partington at Maidstone on August 31, before the members of the Upper Norwood Athenæum.

King Henry II. about 1160 granted to the monks of Christ Church a charter for their lands at Hollingbourne upon the Hills. In the tenth year of King Edward II. (1317) the Prior of Christ Church obtained a charter of free-warren for his manor of Hollingbourne, among others, about which time this manor with its appurtenances was valued at 46*l*. 9*s*. 8*d*.

King Henry VI. (1422-61), by his letters patent in his 25th-26th year, granted to the prior a market, to be held at this place weekly on a Wednesday, and a fair yearly on the feast of St. Anne.

William Selling, who was elected prior in the reign of King Edward IV., anno 1472, during the time of his holding that dignity, greatly improved the prior's apartments, after which it seems to have undergone no material alteration till the dissolution of the priory of Christ Church, which was surrendered into the hands of King Henry VIII. in the first year of his reign (1540), with all the lands and possessions belonging to it, in consequence of the Act passed that year, to the use of the king and his heirs for ever.

The manor of Hollingbourne did not remain long in the hands of the Crown, for King Henry settled it by his dotation-charter, dated May 23, in his thirty-third year, on his new-elected Dean and Chapter of Canterbury, part of whose possession it now remains. There is a court leet and court baron regularly held by the Dean and Chapter of Canterbury for this manor, which extends also over the adjoining parishes of Hucking and Bredhurst.

But the demesne lands of this manor have been from time to time leased out by the Dean and Chapter at a reserved rent of 10*l*. 9*s*. The year after the grant of this manor to them—viz. anno 34, King Henry VIII.—they demised them by lease to one J. Reynolde, and afterwards to Purefoy (1577), Fludds, Alabaster, D.D., Bargrave, Boys, Fanewell and Gookin, till the year 1684, when Sir Thomas Colepepper had a lease of them, in whose family they continued till John Spencer Colepepper, of the Charterhouse, passed away his interest to the Hon. Robert Fairfax, who held them in 1758, and then alienated his to Francis Child, banker in London, whose brother, Robert Child, of London, banker, was the lessee. At his death in 1782 the trustees of his will, Robert Dent and John Keysal, became possessed of the lease under the Dean and Chapter.

Hasted wrote about 1770:—"This parish is situated partly above the great ridge of chalk hills, where the soil is exceedingly wet, barren and stony, and much interspersed with coppice-wood, and partly below it the village of Hollingbourne lies close at the foot of them, at the south end of which stand the church and the vicarage house, near which there is a handsome brick mansion of the time of Queen Elizabeth. By its appearance the owners of it must have been of good condition in former times."

In 1821 there were 156 dwellings in the parish, and at the same period, according to the census, 535 males and 465 females, or just 1,000 souls in all. The village now boasts of its own gasworks, but from a financial point of view the result is not of so remunerative a character as the shareholders could wish.

Hollingbourne Church.

Hollingbourne is within the ecclesiastical jurisdiction of the diocese of Canterbury and deanery of Sutton, and is exempt from the jurisdiction of the archdeacon.

The church, which is dedicated to All Saints, is a handsome building, fourteenth century, consisting of three large aisles, with a chancel at the end of that in the centre, having a square tower at the west end. The chancel is highly ornamented with monuments of the ancient family of the Colepeppers, of Greenway Court, and for two of the Lords Colepepper, several having been executed by the masterly hand of Rysbrach. On the south side is a memorial to Sir Martin Barnham and his two wives, A.D. 1610, presenting their three figures kneeling at a desk, and beneath, their children. On the south wall there is also a monument to Hasted, the Kentish historian, who was vicar of the parish. At the east end of the north aisle is a small, neat chapel, elevated by several steps to give room for a vault underneath, in which lie the remains of all this branch of the Colepepper family. (It is said that beneath the chancel lie the remains of three score and ten members of the Colepepper family.) The sides of the chapel are filled with block escutcheons and square tablets of black marble alternately; only two of these are filled up, and these with younger branches of the family, settled elsewhere—a melancholy proof, wrote Ireland, of the disappointment and vain endeavour of the builder to transmit his descendants to posterity.

On the centre of the pavement is a beautiful raised monument of white marble, with the figure of a lady lying at full length in the habit of the times, of very fine sculpture, in memory of Elizabeth, lady of Sir Thomas Colepepper, daughter of John Cheney, of Sussex, obit. 1638. In the aisle is another memento for Nicholas Chaloner, obit. 1706, and against the north wall of the north aisle one for two of the family of the Duppas. On the north wall of the chancel there

is a very fine monument to Dame Grace Gethin, wife of Sir Richard Gethin, 1697. A mural tablet records the fact that this lady, while in a trance, had a vision of heaven.

At the lower end of the church there are memorials for the Plummers, the Collins and the Dykes. A few years ago, when the new organ was being played, a piece of the flat plaster roof fell down, when the Rev. W. G. Southey, vicar, had the roof examined, and discovered that there was the original roof above. The plaster was removed, and it was found that the original roof of Kentish oak was in perfect preservation.

In this church is a most superb altar-cloth and a pulpit-cloth and cushion of purple velvet, ornamented with the fruits

of the reign of Henry II. In 1821 there were 107 dwellings in the parish, and the population 257 males and 309 females, making a total of 566 souls. The village green is a very famous spot for cricketers.

The church is dedicated to the Holy Cross, and is a handsome building consisting of two aisles and two chancels, with a square beacon tower at the west end. On the summit of the tower at the three corners are the figures of three dogs or bears séjant, for being greatly defaced by time, their forms are merely conjectural. If they represent the latter, they may have

HOLLINGBOURNE CHURCH.

of the pomegranate and vine wrought in gold, being the needle-work of the daughters of Sir John Colepepper, afterwards created Lord Colepepper, who employed themselves for the space of twelve years in working the same during their father's absence abroad with King Charles II. in exile. The death of Lady Elizabeth in 1683 was attributed to blood poisoning, caused by the prick of a needle while finishing a communion-cloth about one o'clock on a Sunday morning, which she was anxious should be used in the services of the day. This needle, which had been preserved for two hundred years, was purloined by a visitor during the time of the late vicar.

The vicarage was endowed before the year 1407, at which period Arthur St. Leger, the rector, granted to William Mamby, vicar of this church, a messuage with its appurtenances in the parish for the habitation of himself and his successors for ever. The rectory of Hollingbourne was valued in the king's book at 28*l.* 15*s.* 5*d.* The vicarage was valued at 7*l.* 6*s.* 8*d.* The vicarage in 1640 was estimated at 86*l.*, when the communicants were 271. It was afterwards of the certified value of 70*l.* 16*s.* 8*d.* The vicarage was augmented 20*l.* per annum by lease between Ralph Staunton, rector, and Sir T. Colepepper.

Hollingbourne Caves.

These pseudo caves were discovered by accident in 1898, when some men were ferreting. While digging for the ferret a hole was found which led into an underground chamber. It was afterwards discovered that this hole was an air shaft to the caves, and situated some distance from the entrance. They are on the main road between Maidstone and Ashford, just past the three-mile stone from Maidstone and fourteen to fifteen miles from Ashford. The extent of the caverns is not known, but the passages, which are very irregular and abrupt, may probably be reckoned in miles. The sand is perfectly clean and dry, and an interesting fact to be noticed is that the temperature is uniform throughout and stands at about 51 degs.; it seems to be unaffected by external atmospheric changes.

The caves now belong to Mr. Walter Fremlin, to whom we are much indebted for the privilege of inspecting them, and especially for his kindness in sending someone to clear the entrance, so that our visit might be more easy and comfortable.

Bearsted, an ideal village, lies north-west from Leeds, and was anciently written Bergestede, having most probably derived its name from the situation berg, in Saxon signifying a hill, and stede, a place and village. It is said to be the cradle of the noble family of Bertie, who possessed lands here before

BEARSTED CHURCH.

been placed there in allusion to the name of the parish; if not, the figures were perhaps the crest of the founder of the church. They are also said to represent the lion, ox and eagle, symbolical of SS. Mark, Luke and John, but this suggestion cannot be correct, as the figures are unmistakably those of beasts. There are memorials to the family of the Cages, to Robert Fludd, M.D., also to William Godfrey, jun., A.D., 1690, &c.

As some of the words in my paper are unfamiliar, perhaps the following notes may be of interest to the members:—

SULING.—A certain measure of land.

CARUCATE.—As much land as one team can plough in a year.

VILLEINS.—The old word for villagers; were slaves who were the property of their masters, and were of three kinds, viz. those who were born of slave parents, prisoners captured in war, or those who on account of debt were reduced to slavery.

PANNAGE.—The food of swine in the woods.

BORDERER.—One who dwells on the borders of a county or near to a place.

SCOT.—In law, a tax.

SCOT AND LOT.—Parish payments.

LEET.—A court; in law, the court leet, or view of frank-pledge to the court of record, held once a year within a particular hundred, lordship, or manor, before the steward of the leet.

HUNDRED.—The division or part of a county supposed to have originally contained a hundred families. In Anglo-Saxon times the land was divided between the State (folcland) and individuals who held their property freehold in perpetuity (bocland from boc, the book or charter from which the title was conveyed). In other words, folcland meant land that belonged to a community, and bocland meant land held by private individuals. The kingdom was also divided into shires (from the A.S. *sceran*, to divide), and these into hundreds. At the meetings of the hundred every freeman was obliged to appear in arms once a year, and also to prove his registry in some tything or association of ten families. Frank-pledge was the mutual responsibility amongst the members of a tything for the good behaviour of the whole. Should one member of the tything violate the law, the other members were bound, if possible, to bring him to justice, and if they connived at his offence, and allowed him to escape, they were fined. The origin of trial by jury has not been satisfactorily ascertained. But although many have attributed this institution to Alfred, Hallam is of opinion that it did not exist amongst the Anglo-Saxons.

The illustrations are from photographs by Mr. C. F. Partington.

LITTLE WENHAM CASTLE AND CHURCH.

A PARTY of members of the Suffolk Institute of Archaeology and Natural History recently accepted the invitation of Mr. George E. Crisp, of Playford Hall, to visit the church and castle at Little Wenham.

At the church, which is in a ruinous condition, a paper was read by Mr. Redstone. The main part of the building, he said, is in construction Early English. This being so, it is probable that of the two churches existing in Wenham in the time of Domesday the one standing within what is now known as the parish of Little Wenham was replaced by the present edifice. It is well here to notice that in the days of the Norman kings Great Wenham, or Wenham Combusta, *i.e.* Burnt, or Brent Wenham, and Little Wenham formed one district, containing two or more manors. Little Wenham Church was distinctly a manorial church, and with the manor, once the property of Odo, Bishop of Bayeux, fell upon the rebellion of that prelate in 1070 into the hands of the Bigods. In the thirteenth century it became part of the possession of the Brewses, through matrimonial alliances with the Rous and Ufford families. The Brewses were great church builders, and wherever the family held possessions some member has left his stamp upon the church; this is notably the fact with the church of Woodbridge-Hasketon. It has been stated by Page and other historians that the Brewses were first connected with Little Wenham in the reign of Henry VI., in the middle of the fifteenth century, and that this church was probably erected by a member of the Holbrook family. The Brewses were connected with Little Wenham at an earlier date, for in 1336 John de Breouse, parson of the church of Stradbroke, and Wm. de Breouse, parson of the church of Little Wenham, settled the manors of Little Wenham and Brent Wenham, and the advowson of the church of Little Wenham, on William de Holbroke and Amice his wife in tail male, or in default, on the heirs of William de Holbroke. It still remains undecided whether the church and castle were erected by a Holbroke or a Brewse; whilst there are many marks of the presence of the Brewses, there remains no sign of a Holbroke having worshipped in the church. When a close inspection has been made of the castle it will be seen that the same hands employed to erect the one were engaged in the construction of the other building. A visitor naturally turns his attention first towards the windows, and fixes the period of construction from the style of architecture they portray. The lancet windows and the sedilia with its mouldings give the year 1260-70 as the date of the church. Especial notice will have doubtless been given to the low window on the north wall of the chancel, which contains a recess, and is sufficiently low to enable a priest occupying the seat to hear the words of a suppliant kneeling without. But there is this to consider—within the castle chapel, in the very same situation, a like window has been made to whisper through, to do which, into the ears of a confessor, a leper or penitent would have been compelled to kneel on the top stave of a ladder 15 feet or 20 feet high. The presence of a recess and the height of the castle window will not allow of the use of these windows as squints, through which to see from without that the lights were burning safely upon the altar or altars within. Low windows are found chiefly in Early English parish churches, and appear constructed mainly, if not solely, for ventilating purposes. The east window, with its three lights and three quatrefoils symbolical of the Trinity, is an exact counterpart of the east window in the chapel of the castle, and the ruinous north window, with the gadding ivy occupying the space between the falling mullions, was erected in the sixteenth century, and was once filled with the arms of the many families connected with the Brewses. The monuments within the chancel speak for themselves, and the double-canopied brass to Thomas Brewse and his wife Jane, dated 1514, may be coeval with the altar tomb within the south wall. In such a church as this there must necessarily be many features which puzzle us as to their origin and utility—*e.g.* for what purpose was the arched recess in the east wall constructed? Have we above us the remains of the rood-beam? To what saints were the nave altars attached to the rood-screen dedicated? Is the receptacle near the south door a holy-water stoup or a font? What saints are depicted in the fresco-painting on the east wall? It has already been stated that the Brewses left their mark upon the churches they erected. There is a distinct record of this near at hand. Upon the plaster remains of the rood-screen is to be seen, engraved in an Elizabethan court hand, the name of G. Brewse, for Giles Brewse, who was the only son of Sir John Brewse by his second wife. Giles Brewse died at Toddington, co. Beds. Near the name is an unfinished Latin sentence, of which the translation appears to be, "He meditates a minute or two with sincerity."

On arriving at the castle, Mr. Redstone read another paper, in which he pointed out that "there are three kinds of castles

known to East Anglians, two of which, strictly speaking, do not come under the term 'castle' as denoting a military fortress, yet, as they were constructed and erected as defensive works, may be considered as castles. The extensive earth-works at Offton and the circular moats at Dedham were never protected by embattlements; and the castellated manor-houses of Mettingham, Southwold and Little Wenham never had their defences tested, as did the royal and baronial castles of Bungay, Framlingham and Orford. Little Wenham Castle, hall or moated grange, was erected about the year 1260, but whether its founder was a Brewse or Holbrook is uncertain. The manor was settled by John de Brewse, of Stradbroke, and William, parson of Little Wenham, in 1336, upon Wm. de Holbroke and his wife, but the conditions attending the settlement are not given. The monumental inscription in the church seems to point to the fact that Sir Thomas de Brewse, as lord of the manor, resided in the castle in the year 1500, and it is probable that to his son Robert, who succeeded him in 1514, may be ascribed the structure of the walls, which belong to the Perpendicular period. The abundant use of Flemish bricks marks a still earlier alteration of the building. A close examination of the inscription on the west wall, "*Cecy fait a l'aide de Dieu l'an de Grace, 1569, N. 1-B.*" shows that the initials are N. 1-B.—not R.B., as given in Page's Supplement. There is a touch of pathos in the simple carving on the south pillar of the door above the inscription of the Brewses' cross crosslet, between the date 1584 and above the Latin farewell salutation "*Vale.*" It may have been carved by Giles Brewse when the family quitted their ancestral home. In making an inspection of the outer walls of the castle, proceeding from the west door northwards, we pass the narrow lancet window and the massive buttress on which the lines of the old sundial are faintly visible. Upon the buttresses, corner-stones and throughout the castle three distinct mason-marks are frequently repeated—one is a Z, running from right to left, and from left to right, or the two combined; another is a W, with the final stroke converted into a 6; and the third is a triangle, with the right side prolonged downwards. The window of the "Sovereign Room," with its two lights, has its dripstone or projecting moulding over the window to throw off the wet, of exactly the same character as those over the church windows, because of the slope upon which the building is erected. Above may be seen the narrow open window of the chapel corresponding to the low window in the church. The east window with its three lights has its counterpart in the east window of the church. The flint and stone used in the wall beneath the window contain material similar to seashore stone or rock employed in the construction of Orford Castle. Upon ascending the stone staircase a constant look-out should be made for the mason marks already mentioned. The banquet-room, with its open hearth, supported within by a much-charred beam, has many features of interest—its Tudor recess, wherein the massive gold and silver plate was washed in the sight of the lord; the glazed tiled floor, once strewn with reeds and rushes; the walls, formerly covered with arras and tapestry; the windows, with their deep recesses and the fine ceiling, will attract the attention of all visitors. But the most sacred spot is the chapel, with its piscina and sedilia, and the carved figure with fingers raised in the act of benediction, within the vesica of the vaulted roof. By ascending the winding staircase an entrance may be gained to the retiring-room, and thence to the summit of the tower, whence the timid may gain through the loopholes a sight of a vast extent of country stretching for miles beyond, which a bolder eye may view from over the battlements. A corner-stone of the tower bears the date 1663. A single bedroom was usually thought sufficient; houses that contained even four beds for the accommodation of their inmates were thought to be extravagantly furnished. Men had then no idea of comfort.

TESSERÆ.

St. Albans Abbey.

NOT to dwell upon the fact that the walls of St. Albans Abbey are composed of materials from ancient Roman structures (probably including also those of the church erected under Constantine), and that several architectural fragments remain of undoubted Saxon date, we have in the building, first, a specimen on a vast scale of the earliest Norman architecture forming the great bulk of the building, including also the great central tower; we have, secondly, an extremely beautiful specimen of the later and more enriched Norman in the passage or "slype" at the extremity of the southern transept; thirdly, we have, in the incipient works in the west front, including probably the three beautiful western porches, works of the earliest Pointed architecture, executed in the days of King John; and in conjunction with these, and on either side of the nave, we have a majestic specimen of the same style in its fuller development, executed early in the reign of Henry I.; fourthly,

we have in the choir a highly finished work of the end of the same reign, evincing the rapid development and refinement of the art at that period, and adjoining this in the half-ruined eastern aisle is a truly exquisite specimen of the same style slightly more advanced and probably executed in the time of King Edward I. In the nave, again, in the eastern half of the south side, we have a most noble and magnificent specimen belonging probably to the close of the same reign, and in the exquisite lady chapel we have the Middle Pointed or Decorated style in its fullest development; while, lastly, in the monumental chapels of Abbots Wheathampstead and Ramridge, and of Humphrey, Duke of Gloucester, and in the magnificent altar-screen, rivalling and closely resembling that at Winchester, we have splendid specimens of the closing period of Gothic architecture, and unfortunately in many insertions into the older work we see numerous instances of the decline which preceded its final extinction.

Mediæval Illuminators.

From A.D. 1150 a new and happy impulse began to be felt by painters and illuminators. Drawing acquired precision, firmness and a certain truthfulness of expression. Nevertheless, a black stroke marks the outlines, defines the form of the principal details and limits throughout the various tints of colour. The fanciful ornaments, the grotesque figures which, mixed with foliage and interlacings, surrounded the initial letters and often formed the sole decoration of the books of the preceding century, now began to be discontinued; the calligraphic borders are not so broad. From this period artists cease to borrow from heathen art and take nature for their guide. Their ornaments are derived from the vegetable kingdom, and their figures, with the exception of Christ, the Virgin and the Apostles, are all attired in the costume of the time. Gold is still generally employed for the ground. Painting continued to progress until the end of the thirteenth century, but the drawing, in which the outlines are too strongly marked, is apt to be hard and stiff. The gold grounds begin to be replaced either by grounds of colour diapered with patterns of gold or by grounds representing an iridescent mosaic, which has a very pretty effect. Painting towards the beginning of the fourteenth century exhibited a marked improvement. The pen is no longer in requisition for determining the outline of the drawing, the brush alone is employed; the motives are full of grace and the execution, although still timid, is always finished.

Vitruvian Buttresses.

According to Vitruvius, the walls in the lower part of a structure should have a thickness proportioned to the magnitude of the building, and *anterides* or *erismæ* (buttresses or counterforts) are to be erected in the front at a distance apart which is equal to the height of foundation. The meaning is not clear, and it is no wonder both Perrault and Galliani have deviated from the text, the latter without taking any notice of any such deviation. They say that the *anterides* or *erismæ* should at bottom project from the walls as much as the height of the wall, whereas the text clearly expresses, "*quam crassitudo constituta fuerit substructionis*," as much as the thickness of the wall. Their reason for this seems to be that as Vitruvius adds, "*deinde contrahentes gradatim ita uti summam habeant prominentiam quanta operis est crassitudo*," from thence diminishing till at the top they are as prominent as the thickness of the work, and understanding by this that the projection of the *erismæ* at the top is also to be equal to the thickness of the wall, and to increase gradually as they approach toward the bottom; they conclude that the text was erroneous in one or other of those passages; accordingly they have fixed on the former and altered it as above mentioned, although it is clearly and determinately expressed, leaving the latter passage (which is, indeed, vague and doubtful) unaltered, for this latter passage may be understood to signify that the *anterides* should project at the top of the foundation no more than is sufficient to receive the thickness of the work of the superstructure with its projecting pilasters, &c. In this sense Barbaro has understood it, and that this is the true sense, the determinate manner in which the quantity of the projection at bottom and the diminution from thence upward is expressed, and in which all the copies agree, renders it highly probable. Perrault remarks that as Vitruvius assigns the distance of the *anterides* to be equal to the height of the wall, the *anterides* will consequently be fewer as the wall is higher, which ought to be directly the contrary, and should be more numerous and closer in proportion as the wall is higher, as being in that case weaker and wanting more support; he therefore supposes we should read *crassitudo* instead of *altitudo*, and that the distances should be equal to the thickness of the wall, but this is taking it for granted that the wall, whether high or low, is to be always of the same thickness, whereas it is always understood that the walls are to be made thicker in proportion as they are higher, and, as Vitruvius before says, in proportion to the mass of ground they enclose. Considering it in this light, therefore, the height and thickness of the walls and the distance

of the *anterides* will be the same in proportion to each other in all cases, and of course be proportionally firm and strong. Vitruvius leaves it uncertain whether the thickness of the diagonal wall at the angles is excluded or included in the projection. He assigns them from the main wall, but Newton, in his translation of Vitruvius, determined for the former, as otherwise those diagonal walls would not bear against the *anterides*, which as being the strongest part of the wall they ought to do.

Hubert le Soeur.

One of the few men we have had that may be called a classic artist was a Frenchman, and disciple of John of Boulogne. Le Soeur arrived at least as early as 1630, and by the only two of his works that remain we may judge of the value of those that are lost or destroyed. Of the latter were a bust of Charles I. in brass, with a helmet surmounted by a dragon à la Romaine, 3 feet high, on a black pedestal; the fountain at Somerset House, with several statues; and six brazen statues of St. James. Of those extant are the statue in brass of William Earl of Pembroke in the picture gallery at Oxford, and the equestrian figure of Charles I. at Charing Cross, in which the commanding grace of the figure and exquisite form of the horse are striking to the most unpractised eye. This piece was cast in 1633 on a spot of ground near the church of Covent Garden, and not being erected before the commencement of the Civil War, it was sold by the Parliament to John Rivet, a brazier, living at the Dial near Holborn Conduit, with strict orders to break it in pieces. But the man produced some fragments of old brass, and concealed the statue and horse under ground till the Restoration. They had been made at the expense of the family of Howard Arundel, who have still receipts to show by whom and for whom they were cast. They were set up in their present situation at the expense of the crown about 1678 by an order from the Earl of Danby, afterwards Duke of Leeds. The pedestal was made by Grinling Gibbons. Le Soeur had a son Isaac, who was buried November 29, 1630, at Great St. Bartholomew's. The father lived in the close.

The Cathedral of Coventry.

When Camden the historian visited Coventry he wrote:—"The city is conveniently placed, large and neat, defended with strong walls and adorned with very handsome buildings, among which are two churches of rare workmanship. The city has nothing very ancient about it except the monastery or priory, whose ruins I saw near those churches." It was founded by king Canute for nuns, who being soon after turned out, Leofric, Earl of Mercia, A.D. 1040, enlarged and in a manner rebuilt it, with such profusion of gold and silver that the walls of the church seemed too confined to contain the treasures, which struck all beholders with astonishment, no less than fifty marks of silver being scraped off one single beam. It also contained numerous religious relics, which were held in the greatest veneration by the devotees. He endowed it with such revenues that Robert de Lindsey, bishop of Lichfield and Coventry, transferred the episcopal see hither, but this see a few years afterwards returned to Lichfield, yet so as that the same bishop is styled Bishop of Coventry and Lichfield. This noble cathedral was levelled to the ground by Henry VIII. at the time he destroyed the neighbouring monasteries, after it had stood nearly 500 years. In Dugdale's plan of Coventry, by Hollar, the space occupied by the cathedral and priory is a blank down to the river Sherborne and to Mill Lane, except a part of the cathedral ruins, reaching from about the north transept to the bishop's palace. The spot was afterwards converted into garden ground. Tanner says:—"The cathedral and the monastic buildings are all gone except the lower part of the western towers, from which some idea of the grandeur of the western front may be formed." The bishop's palace only retained the name, and was sold in 1647 to Samuel Lacey and others. A part of the site of the ancient cathedral was again consecrated in 1776 to be used as a burial-ground for Trinity parish. In June 1825, upon under-building a house at Hill Top, the ground was opened to a depth of 14 feet, when the south front wall of the cathedral, probably the transept, was discovered in perfect condition; the mouldings of the plinth, large and bold, commenced about 12 feet from the present surface, above which was the upright facing of the wall continued about 7 feet, its thickness being about 3 feet. The great central tower was standing in 1576, though despoiled of its steeple. A fine groined stone crypt and vault commenced under the eastern end of the cathedral and ran as far as the transept; it was said to be as much as 220 feet long and 15 feet wide. Several kings, queens and princesses visited this famous priory at various times, and took up their abode there, it having extensive accommodation and extending, with its offices, fishponds, &c., backward from the cathedral to the Sherborne. The sites of the different edifices are recognised by the naming of the streets by which they have been replaced.

NOTES AND COMMENTS.

IN the James Watt Laboratories of the University of Glasgow is a 100-ton universal testing machine, with variable accumulator. The machine consists essentially of a straining system embraced by a weighing system. The torsion apparatus will exert a twisting moment of 224,000 inch-pounds, and will twist in two a bar of iron $2\frac{1}{2}$ inches in diameter. The deflection apparatus has swivel supports to prevent indentation, and the presser-foot also has swivelling half-round pieces which spread the pressure over 6 inches of surface, while still allowing the specimen to bend freely. The steelyard of this machine has an arrangement of poise-weights constructed to meet Dr. BARR'S desire for a larger scale unit when measuring light loads, and has the effect of giving the same scale unit up to 100 tons, which was obtained on Dr. KENNEDY'S machine up to 50 tons, without materially lengthening the steelyard. The accumulator has a variable load consisting of ten 4-ton slabs, of which it can deposit any number up to nine on the base, and carry up the remainder.

TOPOGRAPHY has received so much attention in France and so many surveys have been prepared, it seems incredible that prior to the present year there was no cadastral plan of Paris. In June 1899 the Municipal Council voted funds for the work, which has cost about 1,500,000 francs. The direction was entrusted to M. FONTAINE, with M. TAXIL as chief surveyor. The scale adopted was 2 millimetres per metre or $\frac{1}{500}$, and the plan therefore measures 23 metres by 18 metres. The object of the survey was to ascertain and exhibit the number of properties within the 78,020,000 square metres forming the area of the city. It was found that on January 1, 1901, there were 88,587 properties comprising 84,882 "Maisons de rapport," 1,316 factories and 2,389 factories with residences. The annual value of the properties is put down at 879 millions of francs, which would yield an average income of 10,000 francs for each property. The total value is calculated at twenty thousand millions of francs. It being assumed that as some of the properties would not return 5 per cent., about $22\frac{1}{2}$ years purchase has been taken as the basis of the total value. The returns from the houses are not sufficient for the taxation which will have to be raised unless a higher rate is charged, and accordingly gardens and unoccupied ground will henceforth be assessed. Encouragement will also be given to building by the authorities in order to swell the amount from which a revenue can be derived.

THE participation of architects in the laying-out of gardens has been resented, but it would be an advantage if they or other artists who had made a study of colour were more often able to direct the arrangement of flower beds. CHEVREUIL considered gardens should be subjected to the laws of colour equally with tapestries, stained glass, &c. One reason for the continual repetitions which prevail is that owners of large gardens have not the courage to insist on the adoption of rules by their gardeners. The speech of Sir GEORGE DOUGLAS, Bart., which was delivered a few days ago on the subject at Kelso, is, it is to be hoped, a sign of revolt against the present arrangement. Sir GEORGE said that only once or twice, or at most five or six times, did he meet with a gardener who seemed to have a just notion of a flower's colour value; whilst when he remembered the numbers of gardens he had visited where the gardener's views of colour harmony seemed to be limited to one trite and hackneyed chord of scarlet geranium, blue lobelia, yellow calceolaria, he felt inclined to blush as red as "Lobelia cardinalis," or at least as "Vallota purpurea." Sir GEORGE DOUGLAS wished all gardeners to remember that they could be artists, as they possessed a finer palette than any painter. But unless owners will exercise their authority, and insist on the adoption of something more than the ordinary commonplace contrasts of colours, gardens cannot be considered as artistic, and only a partial advantage can be derived from a mass of beautiful materials.

THE firm of Messrs. SUGDEN & SON have been able to accomplish so much by their architectural skill for Leek and the surrounding district, it would be more than a

private loss if the business came to a close. The unexpected death of Mr. W. LARNER SUGDEN was a calamity, but the surviving representative of the firm, Mr. HARRY SUGDEN, has been fortunate in obtaining an auxiliary who is peculiarly adapted to support him on such an occasion. For over two years Mr. W. D. BLACK has been associated with the business, and he will have an opportunity of showing all his zeal as the partner of Mr. HARRY SUGDEN. Mr. BLACK is a native of Edinburgh, and for a time he was an assistant to Dr. ROWAND ANDERSON, and subsequently was engaged with Messrs. EVERARD & PICK, of Leicester.

THERE is a homely proverb about the unwisdom of putting all the eggs in one basket. It is, no doubt, very ancient advice, but timber merchants would find an advantage sometimes by accepting it as a guide. Messrs. WILLIAM OLIVER & SONS, of Bunhill Row, are now in a position to testify to the good sense of the proverb. The late fire, which did not, however, originate on their premises, has destroyed a valuable quantity of their timber, but as they had long ago adopted the precaution of storing timber in other yards they are now in a position to carry on their extensive business as if no conflagration had occurred. Their customers will not suffer the least inconvenience. As the front stage is saved all communications can be addressed as usual to 120 Bunhill Row. The numerous friends of the firm will be glad to hear that the losses have been fully covered by insurance; indeed, it would be remarkable if in any way Messrs. OLIVER did not exercise foresight in preparing to meet all contingencies. In order to obviate risk all the offices are lighted by electricity, and the "traveller" which has earned a rest is worked by the same power. There is no doubt that with so terrible a fire the consequences would have been lamentable, but owing to the prudent arrangements the premises will be soon seen in their pristine condition.

THE economy which now attends the study of architecture is exemplified in the series of large plates of the "Greek and Roman Orders," compiled and drawn by Messrs. MITCHELL, of the Polytechnic, and published by Mr. BATSFORD. The whole can be purchased at the rate of a shilling an Order. As the primary purpose of the series is to aid students who wish to pass examinations of the Board of Education, the style of representation does not suggest engravers' finesse, which no builder's apprentice could be expected to attain. The dimensions of details are less abundant than in the majority of the older plates of the Order, but they are more likely to be kept in remembrance. The plates are therefore well adapted for students, and their acquisition is a cheap investment, for the Orders are never likely to become disused. A third edition of Messrs. MITCHELL'S volume relating to the advanced course of building construction of the Board is also issued. Illustrations as well as pages have been increased in number, and the examination questions are brought down to 1901. The work deserves, if possible, still more success than before.

CHATEAU DE JOSSELIN (MORBIHAN).

CATHEDRAL SERIES.—CHICHESTER: EAST CLOISTER AND SOUTH AISLE.

UNITARIAN CHURCH, BIRKENHEAD.

THE view of the exterior of the new Unitarian church, Birkenhead, has been reproduced from the drawing which was exhibited in this year's Academy. The commission was gained in competition among architects of Liverpool and Birkenhead. The materials employed are $2\frac{1}{4}$ -inch Ruabon wire-cut bricks with $\frac{3}{4}$ -inch white joints. The dressings are of Heswall stone. The roof is covered with Telberthwaite green slates. An interior view and plans will appear next week. The architect is Mr. J. JOSEPH TALBOT (WILSON & TALBOT), of Commerce Court, Liverpool.

THE EMPIRE, BRADFORD, AND VESTIBULE.

ORNAMENTAL LEADWORK.

By the late W. BURGESS, A.R.A.

AT the present time perhaps there is no metal considered less suited to the purposes of the fine arts than the subject of the present notice. However, the great artists of the Middle Ages thought very differently. Their architecture was (and always must be) eminently an architecture of figures and subjects, and accordingly they compelled even lead to bear its part in the great poem of Christian art. They cast it into ornaments, they hammered it into figures, and with the help of tin they executed imperishable paintings, which, when placed beyond the reach of man, have far more successfully resisted the ravages of time than the crumbling sculpture or the worm-eaten dossel.

At the same time it must be confessed that the intrinsic value of the material has but too often been the cause of its destruction, and although, as citizens, we can scarcely blame the French Government for melting even the historiated lead into bullets for the defence of the country, yet, as artists, we must ever deplore a necessity which has left us vestiges so few that our curiosity is rather stimulated than our inquiries gratified. I can, therefore, only pretend to put before you a very short notice of the various objects which our forefathers produced in lead and tin—beginning with those belonging to the Church—the great art patroness of the Middle Ages.

Roofs.

Let us imagine the architect had got up the carpentry of his roof, and then proceed to ascertain how he went to work to cover it; and here it may be premised that his roof is a very different one to those designed by the late ingenious Mr. Peter Nicholson. However, the only points of difference with which we have to do at present are—first of all, that there is no ridge-board, the rafters meeting one another at top whilst they are kept in a straight line by means of a ridge-beam below; the second point of difference is that the king-posts stand up above the roof for a considerable distance. In the thirteenth and early part of the fourteenth century, however, when continuous ridges were used, composed of isolated members as at Amiens or Exeter, the ends of all the king-posts, except that over the apse, were cut off, as they would not be wanted for the support of the ridge.

Now the architect, in those days as in these, had the choice of tiles, slates, or lead to cover his roof with, but then, as now, the latter was by far the most costly and the more esteemed. Still, even tiles and slates under his hands became beautiful. The tiles were covered with variously coloured enamels as at Mantes, while the slates had their edges cut into diver shapes, and were disposed in patterns according to their tints.

When lead was used it was generally very thick; that at Canterbury, I am told by Mr. Austin, runs about 12 lbs. to the foot. The roof being boarded, the lead was laid on much in the same manner as at the present day, except that the sheets were somewhat narrower (about 2 feet between the rolls), and that these latter were formed by turning over the sides of the sheets without the assistance of the wooden rolls used by the modern plumber. If there was no ridge the rolls were continued over the top of the roof and a little way down the opposite side, so as to allow the sheets to hang well on. If, however, there was a ridge the method was rather different. And here it may be observed that during the Middle Ages everything susceptible of having a ridge applied to it had one. This was the case even with the miniature enamelled "Bahuts de Limoges," and still more so with regard to the large silver chasses for reliques, some of the crestings of which are most beautiful, though of course treated according to the different nature of the material employed. The tile roofs had tile crestings, several of which have been discovered at Great Malvern, but the slate roofs were treated in a similar manner to the lead ones, to which latter we now return. We have hitherto supposed the roof to have been boarded and covered with lead, with the rolls continued over the apex. Now, as these rolls would interfere with the ridge they must be suppressed, and accordingly the sheets of lead are made to finish at some little distance (1 foot or more) from the top of the roof where they are turned in and nailed to the under side of boarding. The apex was not generally covered by two boards butting up against each other. On the contrary, it was thought better to cut a sort of trough out of the solid, and to apply it reversed to the top of the rafters, so as to form as solid a foundation as possible for the ridge. Irons in the form of an inverted Y were nailed on this inverted trough at proper intervals, and then the piece of lead forming the ridge piece having had corresponding holes cut in the middle was slipped over them. The next thing was to cast the various members of the cresting, to solder them together (for they could only be cast in halves), to slip them over the projecting irons, and lastly, to solder their lower extremities to the leaden ridge piece. When nails were used, the heads were covered with a

square piece of lead soldered at one end; and as this solder extends some way down, and is marked with the iron, at a little distance the whole looks like a coat-of-arms with a chef. Fig. I is from Amiens, and affords an excellent example of the very simplest form of ridge. Unfortunately there is nothing to tell the date by, as the fleurs-de-lys have been mutilated on one of those occasions when the French nation, wearied with kings, expelled the dynasty and defaced its badges. Most probably it is a sixteenth-century restoration of the thirteenth-century ridge; for the spire was burnt down, and with it part of the roof in 1527, and when restored shortly after, a very different form of ridge was in vogue. At Rheims the principal member of the cresting was 2 feet high and 1 foot 6 inches wide (French measure); that at Exeter is about 1 foot high by 10 inches wide. I am afraid that even the oldest part of the

VII. Construction of a medium-sized Crocket.

VIII. Upper portion of the Spire of Notre Dame, Châlons-sur-Marne, showing the tinned ornaments.

Exeter ridge must be considered as a sixteenth-century restoration of an earlier one. Mr. Cornish who conducts the works of this cathedral has presented one of the ornaments to the Architectural Museum, where it is now to be seen; it is very badly cast and ill-adapted for its position, as the upper part is heavier than the lower.

The next modification of these simple forms is to be seen at Noyen, where a cusping is attached to the bottom of the trefoil or fleur-de-lys; this cusping being supported on two sides would have strength enough to keep it straight and not to sag by its own weight. This example is about the middle of the fourteenth century.

I must now go for authorities to the work of M. de la Querrière, who has given several specimens of ridges, but unfortunately has said nothing concerning their construction, which, however, was all upon the same principle; and we now see why the king-posts are carried up, for to them is nailed at some distance above the apex of the roof a bar of iron covered

loosely with lead. The ridge, which is always of an open and delicate pattern, is cast in two halves as usual (except when it is very light and open), is then soldered at bottom to the ridge piece, and at the top to the lead pipe covering the iron bar.

Occasionally, as in the Hôtel de Bourgtheroulde, at Rouen, the cresting is divided into two parts, one of which is fixed above and the other below the iron bar. In this case the upper portion is always the lightest, but still should always be kept very subordinate, as on account of having nothing to support it, it is liable to sag. De la Querrière tells us that in this instance it had disappeared.

Where slates were used, another decoration to the ridge piece was the application of long-pointed strips of lead alternately pointed and curved. These were cast and soldered on to its lower extremity; they occur at the Château Meillant, Seine-Inférieure, at the house of Jaques Cœur and at the Hôtel Cujas, Bourges.

Girouettes.

One of the objects of permitting the king-posts of roofs and the centre posts of spires and dormer windows to project was to get something on which to fasten the girouette, epi, finial or weathercock. These girouettes must have been one of the principal features in a Mediaeval town. Every house had one, if not several, and although there were laws occasionally passed restricting particular forms of vanes to the nobility, there were none that I know of to prevent the bourgeoisie having theirs in the shape of animals, birds, &c.

The girouettes, although remaining in far greater numbers than the ridges, are if anything even more difficult to get at for the purposes of study, inasmuch as they are placed on the most elevated parts of the edifice, and nobody ever cares to take them down until the building itself is destroyed. However, I have been so fortunate as to meet with one in the possession of M. Benvignac, of Lille, who kindly afforded me every facility for examining and drawing it. The construction is as follows:—An iron rod, the length of the proposed girouette, is split at the end into four feet, which are made rather long and broad, in order to fix it securely on to the king-post; this part is secured from the weather by a square hollow pyramidal covering of lead resting on the rafters and ridge of the roof; the rest of the rod is covered by a lead pipe, to which are attached various ornaments. This principle applies to the construction of all girouettes, the only difference consisting in the ornaments which, in the greater ones, will be found to be larger and more complicated; the lead pipe in these latter is made in several pieces, and each part of it supports itself upon the one below, which generally terminates with a flattened sphere or some other ornament adapted to the purpose. The upper piece of all which rested on the top of the iron rod had the plate of copper forming the vane soldered on last, and Mr. Potter, of South Molton Street, informs me that in the ancient work these upper pipes had a piece of agate inside, so that there might be less friction on the top of the iron rod; but in the present day gun-metal is used instead. The vane itself was painted with the arms of the proprietor or else gilt.

It is a curious thing that Chaucer as well as several other authors mention the harmony made by the vanes as something to be admired. Whether this is simply an exaggerated poetical expression for the creaking noise a number of vanes would collectively make, or whether each vane turned some mechanism concealed in the lead ornaments below, or whether the vane being double, the wind by blowing in between produced a noise like that of an Æolian harp, it is almost impossible at this time to decide.

The hospital at Beaune in Burgundy is the only building I am acquainted with which has preserved the whole of its girouettes and which can give us an idea of the effect produced by a number of these decorations; but inasmuch as they have all been restored and repaired, I can hardly consider them as quite safe guides with regard to the lead ornaments, although these latter themselves are pretty authentic, as several of the ancient stone moulds are preserved, and have been made to do duty again. During the Middle Ages the moulds for running lead ornaments were often made in stone. There is a mould formed in what is called the Speckstein, a lithographic stone, preserved among the collection of leaden tokens in the British Museum. See also the Bristol volume of the Archæological Institute with regard to a mould for pilgrims' tokens, said to have been found in the catacombs at Rome.

The general arrangement of the ornaments appears to have been this: the square pyramidal base was decorated at the sides with crockets; these in the Tournay specimen are flat, cast in lengths of three and then soldered on to the edges. In larger examples than this the crockets resemble those placed in the upper part of the girouette and described hereafter. A gilded sun, very thin and very open, was often fixed to the front of the base.

The space between the base and the weathercock is for the most part occupied by three tiers of ornaments. The

lowest consists of a flattened sphere, from which project sundry square or cylindrical short pipes, ending in stars or quatrefoils or masks, but more generally in a lozenge-shaped ornament, surmounted by a pediment; these several parts are cast separately and then soldered together. When this lower ornament is very large, as often happens, it requires to be supported by irons which are attached to the centre (iron) stem; of course in this case the lead pipe is interrupted. The ornament in the second tier is often a repetition of the one below, only smaller. Occasionally it takes the form of an open vessel, and does duty as a bird's-nest. They would appear to have been as fond of birds in the Middle Ages as they are now of storks in Holland and Upper Germany, where a nest is regularly made upon the top of the house against the bird's return. The last stage generally consists of a finial, formed of four or more crockets. These crockets are cast in halves, soldered together, the stems again soldered to the lead pipe and the inner leaves to each other. This, if they are not very large, will be sufficient to support them; if, on the contrary, they are rather large, each crocket has a thin piece of iron covered with lead (copper will do alone), one end of which is soldered to the lead pipe and the other to the extremity of the crocket. And while on this subject it may be as well to show how the largest crockets, such as those on the spire at Amiens, which are 1 foot 6 inches long, are managed. An iron, about 1½ inch square, has its end split into two parts, so that it resembles the letter T; the split part is nailed on to a single rafter, and the other, which juts out, is covered with lead; on the upper surface is soldered a piece of very thick lead, to which some of the upper leaves of the crocket are soldered; the end leaves next the rafter and the stalk are, of course, fixed to the lead covering of spire as usual. Another way of treating the medium-sized crockets was to make the iron in the form of an L, fixed in a similar manner; the projecting part covered with lead as usual, is soldered to the inside of the back of the crocket, in the body of which two holes are bored to let out the wet. The crockets running up the sides of dormers are usually executed in this manner.

But to return to the girouette. A very favourite ornament for their upper parts was four or more thick iron wires covered with lead, the ends of which are fixed into a thick square horizontal piece of lead soldered on to the pipe; a little higher there is another horizontal piece of a circular form, to which they are again soldered; the extremities of the wires end with flowers or balls.

Figures.

Another very favourite finish for a roof, especially at the east end, was a figure of the patron saint, beaten out in lead. The following extract, given by M. de Laborde, from the accounts of St. Maclou, Rouen, gives us some information upon the subject, as well as the names of the artists. "1514. To John Pothyn, sculptor, for having carved a prophet in walnut wood, to serve as a mould and pattern for the works in lead. All then the plumber had to do was to hammer sheets of lead over the wood statue until they fitted to the shape; these were then cut off and soldered together again with an iron frame work inside, to prevent the figure from getting out of shape and as a means of securely fixing the whole affair. At Paris where several of these figures have lately been executed for the Ste Chapelle and elsewhere, cast-iron moulds are substitute for those in wood, as will be seen by the following notice which I owe to the kindness of M. Gerente, of Paris:—

"You were correct in thinking the angel at the chevet of the Ste Chapelle is made of lead. Wood and lead are the only materials used in the flèche; for all the flat surface cast-lead is employed, but for the ornaments and figures miller lead is hammered on to cast-iron moulds. In a few instances lead castings are met with, such as the suns in the arcade. There is no zinc used at all. The moulds for the figures are made, of course, in several pieces; the different parts of the figure having been beaten up upon them, are joined together, soldered inside, and the joinings outside made with the hammer. As to the decoration, there is no tinning at the Ste Chapelle, but merely gilding, which is done with two coats of oil, yellow tint-varnish, and over it gold in leaf."

There is one difference between the ancient and modern leaden figures, which I think perhaps deserves to be noticed. The latter are soldered together like a modern work in bronze, i.e. the whole of the surface is homogeneous. Now, as far as I could ascertain by reference to the figures on the spire at Amiens, the former (i.e. the ancient ones), although soldered in parts, are nevertheless in two or three pieces, the joint probably being made by means of a lap as in roofs, and the places of junction concealed by means of the folds of the drapery; in fact, in a similar manner to the ancient bronze statues of the Herculaneum.

The same method was carried out in detached pieces of carpentry covered with lead, such as pinnacles, where one (if not two) of the edges is made by a lap—never by solder. It would appear to have been a principle to lay the lead as loe

as possible and to be very sparing in the employment of solder. It still remains to be proved which is the better of these two ways of constructing figures in lead—that of the moderns is certainly the strongest; the only fear would be the chance of it cracking for want of the necessary play for expansion. The figure most generally placed on the abside of a cathedral was a gigantic angel, which was so contrived as to answer the purpose of a weathercock by means of the wind acting on its wings. There are examples at Chartres and Rheims—the former is modern, the latter doubtful. At Evreux the crest ended in St. Michael and the dragon; at Rouen with a St. George; but of all the leaden figures which have come down to us, few exceed those on the flèche or spire of Amiens Cathedral, as large as life, and representing Our Lord, the Blessed Virgin, St. Peter, St. Paul, St. James, St. Firman and St. Ulpha. Above them are smaller figures of angels bearing the instruments of the Passion. This flèche is truly a *chef-d'œuvre*, whether we consider it with regard to its carpentry or its leadwork. Among the many beautiful wooden spires still left us in France, this is beyond all comparison the best. Every decoration possible to lavish upon it in the way of leadwork has been bestowed, and that with no sparing hand. Statuary, foliage, gilding, tinning, painting are all there, and well did it deserve its title of the golden steeple.

Flèches.

The wooden flèche or steeple was one of the chief features of every cathedral in France, where we so seldom meet with the centre tower. Chartres formerly had two flèches, one in the usual place at the intersection of the transepts, and the other between this last and the angel on the chevet. Its destination was to contain a bell, which was rung from inside to warn the ringers in the great towers when to sound the great bells. There are still two beautiful flèches remaining at Rheims and Evreux, the latter of which is pierced with openings nearly all the way to the top. In fact, so solidly were these charming little edifices constructed, and so scientific was the application of the timber and the lead, that very few indeed have perished from the effects of time compared with those destroyed by some disastrous fire, and yet in spite of this it is proposed to put a roof and flèche of iron and zinc upon the restored cathedral of Cologne.

Dormers, &c.

The only thing now wanted to complete our roof will be the dormers and air apertures. As to the former, it is simply an affair of covering the work of the carpenter, with the addition of the cresting and girouette. They deserve notice, however, as it is on their recessed pediments and on their sides, so well protected by the eaves, that the plumber applies his polychromy.

Of air apertures there is a charming example at Beaune. It is in two pieces; the front one is cut out, beaten up and soldered to that at the back, the flanges of which are inserted below the slates. It may best be described as a miniature dormer, entirely formed of lead, no wood being wanted to keep it in shape as it is so very small.

At Lincoln the lead of the gutter, which is relatively high up, is continued outside over the stone parapet, where it is beaten up into an octofoil ornament. I have been able to learn no particulars concerning this beyond the fact that part of it has lately been destroyed.

Water-pipes were a comparatively late invention, and can hardly be said to have been used in the Middle Ages. When, however, they did come into use they were made ornamental with colour and gilding.

Polychromy.

The architect having thus finished his roof, which, we may observe, was an affair calculated to last for four or five centuries, not simply ninety-nine years, neither more nor less, he thought that as so much pains and expense had been taken to make it strong and beautiful, it was worth while to go a little further and give it all the advantages of colour. How was this to be carried out? Direct polychromy could only be used in the more protected parts; and oil gilding, although in some situations very effective, hardly contrasts sufficiently with the lead to make it desirable to employ it in large quantities, to say nothing of the excessive expense.

The problem was solved by the use of tin, whose imperishable brilliancy contrasted well with the dulness of the oxidised lead, and which, being applied by fire, became part and parcel of the latter metal, and could neither be washed off by the rain like the gilding nor cracked by the sun like the oil painting.

The process of tinning is thus performed: the lead, being first of all covered with a tolerably thick coating of lamp-black and size, and the pattern traced with a point, all that part of the surface to be tinned is removed with the shave-hook, so as to leave it quite clean and bright; a little sweet oil is then rubbed over, and the solder applied and thinly spread with a copper bit in the usual manner.

The next thing, of course, was to fix the lead in the position

it was designed to occupy, for the tinning was done in the workshop, although occasionally it was performed when the lead had been up many years. Thus the spire of N. D. at Chalons-sur-Marne was probably constructed in the fourteenth century, but we must refer the tinning to at least a century later. In this case the process was the same, only much more tedious, as the workman was only able to apply so much tin as the end of his axe-bit would take up, and accordingly we find the work in the instance under consideration very coarse and rough, contrasting strongly with that on the dormer window at the east end of the same church.

All the leadwork of the roof was more or less susceptible of this decoration, but it was generally confined to the more ornate parts, such as the bases of the girouettes and the dormer windows, but more especially to the ridge pieces, which latter contrasted well with the long dark body of the roof, which was left plain. Almost all the principal Mediaeval edifices of France present more or less of this decoration; but I am not aware that any traces of it are to be found in England, although M. Durand, who executes the leadwork for the Sainte Chapelle, informed me that he had heard of some existing in England—he thought at Shrewsbury.

The places where gilding was applied are generally betrayed by the yellow or reddish colour mixed up with the oil, which formerly served to attach the gold leaf now washed off by the weather. In almost every instance, however, the gilding has in its turn preserved the mordant, and we are thus enabled to detect its position. The large figures terminating the crests were formerly gilt, and occasionally the ridges. To such an extent was this practice carried that Charles IX. issued an edict forbidding the inhabitants of towns to employ gilding on the exterior of their habitations.

It has been before observed that the recessed pediments of the dormers, their sides—when protected by eaves—and other sheltered situations received polychromatic decorations. The colours were not applied directly upon the lead, but upon a tinned surface, the lines alone being left to oxidise. The oil colours used upon the tinning were transparent, so that they might receive the full benefit of the brilliancy underneath; these paintings were easy to restore, for their outline was unalterable. I should imagine the subject upon the cheek of the dormer at Chalons-sur-Marne to have been originally coloured, although only the tinning and a few traces of the mordant of the gilding remain. This supposition is rendered more likely from the relation of M. Barbar, an old inhabitant of the town, who told me that when a boy, at the beginning of the century, he lived close to the church, and that one night a piece of lead fell down from the roof into the yard, the which piece was enriched with a variety of positive colours, such as red, green, &c. The plumber to the hospital at Beaune also informed me that traces of colour were found on the girouettes when under the process of restoration. According to his account the colour was thus distributed: the bases were painted in chevrons in red (and tin); the stems had a ribbon pattern; the rondels were blue, and the ornaments gilt. At present the only perfect specimen of polychromatic decoration upon lead I can refer to is on the inside of the second stage of the Amiens flèche.

Window Leads.

After covering the edifice the next important employment of lead in ecclesiastical art will be found in the windows. Now the old lead for this purpose was cast, not milled; it was also much narrower than the modern, but contained, if anything, more metal. The consequences are that much of it is good up to the present time, while our flat, broad, milled window-lead, having its grain broken by the milling and presenting a very thin and very broad surface to the air, becomes rapidly deteriorated. At Beauvais I saw some lead which was probably put up at the end of the last century, quite in a state of oxidation, and at Tournay, where the whole of the immense windows of the choir have been filled with stained glass, at no very distant period a very large expense will have to be undergone to fresh lead the whole, as nothing better than the common cottage window-lead has been employed.

Theophilus, in his excellent treatise on the arts of his time, gives us a rather long description how these glazing-leads were cast, two sorts of moulds being employed indifferently, viz. those in wood or those in iron, of which the latter were, of course, preferred on account of their superior durability. The lead was cast in pieces about a yard (ulna) long, and when wanted to be soldered together the two pieces were anointed with wax, lead was rasped over the surface, and the tin applied with the soldering-iron.

For the purposes of ventilation in domestic work it was customary to cast perforated leaden quarries. A specimen of these may be seen at the Architectural Museum.

Fonts.

Mr. Albert Way, in vol. vi. of the *Archæological Journal*, has enumerated no less than twenty-two leaden fonts as remaining in England; they are almost all referable to the

Norman period, and present the same general features in the design, which consists for the most part of figures seated within circular-headed arcades, with a band of foliage at the top and bottom of the compositions; sometimes the figures are all the same, sometimes they alternate with scrolls, and sometimes a totally different arrangement was followed, as at Brookland, Kent, where there are two ranges of arcades, the lower containing the labours of the months of the year, the upper the signs of the Zodiac. At Llancaut and Tidenham are fonts both cast in the same mould. I suspect that in these fonts separate wood moulds of the arcades and figures were impressed on the sand and the whole cast flat, and subsequently bent into shape and soldered together. The finest lead font remaining is to be found in the cathedral of Mayence; it is of immense size, suitable for immersion. The date is the fourteenth century, and the ornaments consist of edge tracery and figures in relief.

In the museum at Amiens is a font which deserves particular notice from the remarkable manner in which it is fabricated. All the ornaments, the tracery, the buttresses, the arch mould and label and the figures can be detached by removing certain rivets; it is, in fact, treated exactly as if it were made of iron not of lead.

Coffins, &c.

As our life begins at the font, so it ends with the coffin, and here we see the artists of the Middle Ages lavishing their pains and labour on an object which certainly stood the smallest possible chance of ever again being beheld. The ornaments on the coffins of the noblemen buried in the Temple Church are quite worthy of the golden period of art in which they were produced. They appear to me to have been executed much in the same manner as the ordinary lead fonts, viz. by impressions of wooden moulds upon the sand, the sides, top and bottom being cast separately and then soldered. Some of the ornaments were formed by imprinting ropes in the sand. The cist found at Lewes containing the remains of Gundreda, the wife of the Earl de Warren, was decorated with a lozenge-pattern cast from impressions of ropes.

Lead was occasionally employed in filling up the incised lines of monumental slabs. There are several examples of this at Chalons-sur-Marne, but I must confess I do not see any advantage it affords over the dark cement generally used for the same object, for it is apt to oxidise, and if not continually swept gets indurated with dust, and ends by becoming almost the same colour as the stone itself.

Lead or pewter is also occasionally employed instead of white enamel for the "argent" in armorial bearings found on monumental brasses.

The joints of tracery and other parts of the masonry, where it was thought undesirable to wait for the setting of the mortar, are often found run with lead. This system obtains a good deal in France at the present day; for instance, the whole of the restored tracery in the triforium of Troyes Cathedral is set in lead. In some cases it cannot be said to be without its disadvantages, for in the chapter-house at Salisbury a very great many of the neckings of the columns of the arcades were found to be split off at the point where the hole had been drilled for the lead to run into.

Lead is occasionally found doing duty for carving in wood and stone even during the Middle Ages. The practice is, I think, by no means to be commended, and the less said about it the better.

Lead for Domestic Uses.

There now remain a few words to be said upon lead and its alloys in the domestic life of the Middle Ages. When in 1260 Etienne Boileau compiled his book of the trades of Paris, the workers in pewter were sufficiently numerous to be divided into two companies, one called the "potiers d'étain" and the other the "ouvriers de toutes menues œuvres." The former produced the pewter vessels so universally in use in the households of high and low, while the latter fabricated the mirrors, the pilgrims' tokens, the little bells for horse furniture, the charming little boxes made of wood and covered with perforated cast-lead, the studs and ornaments for girdles, purses, &c.; in short, he was the jeweller of the poor.

In the latter part of the Middle Ages the potier d'étain, or pewterer, became quite an artist, for the works of François Briot are sought after by collectors of the present day with as much eagerness as those of Luca della Robbia. The latter, in order to multiply his works, from a sculptor became a worker in clay, and the former, for similar reasons, quitted the profession of a goldsmith for that of a pewterer.

It is generally supposed that Briot's pewters are but proofs of his works in the precious metals, and, in fact, that he never abandoned his former profession. In support of this we are told that it was the custom of the goldsmiths to run proofs of their works in pewter, and that Cellini recommends the practice and did the same thing. As regards the first argument, it is singular that we should have so many proofs (very often duplicates) of the works of Briot, and none of his contempora-

ries; and as to Cellini, a reference to his work, "Trattati dell' Oreficeria," ch. xiii. will show that he only recommends sundry small ornaments (intended to be joined to *repoussé* work) to be modelled first in wax, then cast in lead, and finally cast in silver; for he says, "you can reduce the lead thinner than you can wax, and it will serve for another occasion." From the context it would appear that the articles cast were very small, and that the last intention of Cellini was to use them as an article of commerce. We may therefore suppose that Briot, who was a contemporary of Cellini, was simply a "potier d'étain," but that he took the higher branch of it, viz. the manufacture of those pewter vessels which we find catalogued in the inventories as "à façon d'argent."

Few or none of the larger pewter vessels of the thirteenth, fourteenth and fifteenth centuries have come down to us beyond the half-decayed chalices and patens occasionally found in the tombs of ecclesiastics. The book of Etienne Boileau is quite sufficient to show that large quantities of it were manufactured; besides, we have the testimony of Theophilus, who gives a description as to how the ampullæ of tin were made. No doubt the fusible quality of the material has been the cause of the deficiency; yet we can scarcely regret it being melted into such works as Briot and his German imitator have left us.

There are two articles manufactured by the lesser pewterer which call for some little notice:—First, the counters, or mercaux, which are supposed to have done duty instead of copper coinage; and, secondly, the mirrors. These latter, we are assured by Vincent de Beauvais, were made by pouring hot lead over glass; and it is just possible that such a method might succeed if the glass were kept up to a sufficiently high temperature. Whatever might have been the process, it is a certainty that glass mirrors with lead applied behind them were well-known articles during the Middle Ages.

From Theophilus we learn that manuscripts were ornamented by means of tin ground into powder and applied with gum, much in the same manner as we now use gold-shell; and a varnish composed of saffron completed the imitation of the more valuable metal. Tin was likewise beaten out and used instead of gold-leaf—varnished, of course; but the most curious application of it was to form the ground of what the good monk calls a translucid picture. A surface, covered with burnished tinfoil, had a subject painted upon it with transparent oil colours, a procedure which, I suspect, was followed with regard to the blank windows, painted in imitation of stained glass, in the cathedral at Florence.

Thus we have seen, although in a very imperfect manner, how important a part even the vilest of the metals played during a period when art was universal, and applied to all the purposes of life. The history of a metal becomes under these circumstances the history of almost all the arts of the period. At present, unfortunately, we have no distinctive art, and although much might be written concerning the useful purposes to which lead and tin are applied, I am afraid their art history would be very small indeed. However, within these last few years we are beginning to amend; and, indeed, it would be folly to despair of an age which can produce such a picture as the *Huguenot* of Mr. Millais.

ART EXHIBITIONS IN JAPAN.

THE Tokio correspondent of the *Times* writes:—For some years past it has been customary to organise art exhibitions in Tokio every spring and autumn. Originally this enterprise was under the sole auspices of the Bijutsu Kyoshinkai, or "Art Union," which enjoyed influential support and was connected with a school of art receiving a substantial measure of Government assistance. By-and-by another association, the "Glyptic Society," entering the field, made arrangements to exhibit articles representing its own specialty and at a still later date several prominent experts, seceding from the Fine Arts School, established a rival academy of their own, and were soon able to advertise a competitive gallery of pictures and other art products. Finally, the lacquer manufacturers formed an independent union, and they too give periodical displays, so that there are ample opportunities for estimating the progress and present condition of Japanese art.

The general fact established by these exhibitions is that in every field of art Japan has made substantial advances during recent years. It has long been habitual with the European and American collector to maintain the opposite view. He has insisted that the work of pre-Meiji artists stands far above that of their modern successors, and that no man of educated taste would seek to acquire examples of the latter so long as specimens of the former remain procurable. That was a true verdict with regard to the outcome of a brief interval after the fall of feudalism, when the Japanese artist suddenly deprived of the munificent patronage he had enjoyed for centuries, and confronted by bewildering novel conditions, fell out of touch with his old standard

and sought to supply their place with false conceptions of Western taste. But the aberration did not last long. It was soon succeeded by a wholesome conviction that the road to achievement lay, not in pandering to public taste, but in educating it, and thus for the past twenty-five years Japanese artists have been steadily ascending to higher and higher levels. Possibly in the field of pictorial art this appreciation may be queried. It is difficult, however, to make any accurate comparison, for the past displays to us only its masterpieces, the works thought worthy to be treasured and preserved, whereas the present shows us its bad as well as its good, and we are apt to forget that excess of the former must have been a feature of other eras also. But, if the pictorial ground be debateable, nothing of the kind can be said of applied art. There the verdict is certain. In lacquer the Japanese are at least as great as they ever were, while in cloisonné enamel, in sculpture, in ceramics, in textile fabrics and in metal casting they have quite distanced their predecessors. It is, perhaps, misleading to set up any comparison between past and present in the matter of cloisonné enamel, for, with due apology to the treasures of collectors who attach value to the mere age of a specimen and have been greatly misled by ill-informed English authors, the hard fact must be stated that the art of successful cloisonné enamelling is not more than forty years old in Japan. Enamels were used, indeed, for decorative purposes at a very much earlier period, but they always occupied a subordinate position, and it does not appear to have occurred to Japanese artists that they could hope to imitate the specimens occasionally sent to them from China—specimens having the whole surface covered with enamels in cloisons. The first serious attempt to follow these models was made in 1838, and not until about 1860 were pieces produced showing artistic merit. Even then several years elapsed before these Japanese examples grew famous for harmony and richness of colour combined with fine technique, and the public had to wait still longer for the cloisonless pictures and exquisite monochromatic and translucent enamels of recent years. It is difficult to conceive the possibility of further progress. But in the meanwhile a curious achievement has to be recorded. The Japanese have now shown that they can imitate with absolute fidelity the finest enamels of the Chinese masters in the later Ming and early Tsing eras. This essay appears to have been undertaken by way of pastime, or, perhaps, for the sake of silencing critics who, while admitting Japan's excellence in her own lines, denied her capacity to follow the solid, restful and admirably decorative models of the old Chinese masters. Her artists seem to have experienced no difficulty in refuting the assertion. They are to-day making, by way of variety, enamels indistinguishable from choice examples of Wanlieh and Kang-hsi skill, and it is not improbable that collectors in Europe and America will soon be paying high prices for so-called "Chinese antiques," just as worthy to be admired as their originals, but still imitations after all.

This proof that Japanese workers in enamel, stepping out of the route where they are absolutely unique, can meet and compete successfully with the Chinese master on his own ground is less interesting than another fact demonstrated by the exhibition now drawing to a close in Tokio. Just as the ignorance of linear perspective shown by Japanese painters in past times seemed hard to reconcile with the closeness and accuracy of their observation in other directions, so their inability to sculpture correctly the attitudes and contours of the human figure contrasted strangely with their admirable studies of facial expression, drapery and the dynamics of motion. The conclusion drawn was that anatomical facts escaped their notice, and that the defect could not be remedied without scientific training. But that inference was completely falsified some thirty years ago, when an artisan (Matsumoto Kisaburo), a man in the rank of an ordinary mechanic, suddenly began to sculpture wooden figures as faultless anatomically as the works of Greek masters. Without special education of any kind, without even an opportunity to study models in a studio, not only did Matsumoto prove the unerring accuracy of his observation, but his pupils and successors also evinced the same capacity. Their fault was over-realism; their works were entirely objective. Still they showed that even the commonest class of artists in Japan can accurately model the surface of the human body without knowing anything about the underlying bones or muscles. It may be noted *en passant* that proof of a similar faculty has been given by modern Japanese painters. The best of them in former times never limned anything resembling a real tiger. They painted a tiger's skin admirably, but what they put inside the skin was a fabulous monster. They had never seen a tiger. But now that Western civilisation has brought the circus in its train, they are able, having seen, to place that already perfect skin upon an irreproachable mass of ferocious, snarling energy, true to life in every detail. As for Matsumoto's school of wood-carvers, the element of idealism wanting in their work has now been supplied by experts of the

Art Academy, who sent to the Tokio exhibition sculptures of the very highest merit, quite faultless anatomically, and showing grace, tenderness and softness such as never previously distinguished Japanese carvings in wood. Since the seventh century the glyptic artist in Japan has been able to depict majesty, ferocity, benignity and decrepitude, alone or in combination, and since the sixteenth his chisel has produced, with unsurpassed fidelity, birds, flowers, insects, fishes and other natural objects. But only now has he attempted to show the normal human figure in its gentle, pathetic, passionate and tranquil aspects. In this field he seems likely to achieve what has long been hoped from him—the union of modern technical methods with old and purely Japanese artistic instincts.

The work of the Japanese keramist of to-day, though little can be claimed for it in point of originality, is also seen to have made remarkable strides. Some ten years have elapsed since, ceasing to think only of following in the footsteps of his predecessors, he turned his attention to Chinese porcelains as the best types for a new departure. Chinese céladon always commanded the highest esteem in Japan, as, indeed, it did in the land of its origin. Yet the Japanese of pre-Meiji days could never imitate it to his own satisfaction. Even the most delicate and velvety glazes of the Nabeshima experts seemed palpably inferior in artistic eyes to the Kwan-yao of the Sung dynasty and the Lung-chuan-yao of the Ming. But of late there has been a long stride of progress. It is true that the Japanese connoisseur still affects to despise the modern céladons of his own country as compared with their early Chinese prototypes. He cannot deny, however, that either Séifu of Kyoto, or Miyagawa of Ota, or Kato of Owari can produce céladons quite equal to the lace-surfaced or pure monochromatic wares of the Kang-hsi and Chien-lung kilns. Céladon, indeed, is no longer regarded as a technical feat in Japan. A higher ambition is to rival the celebrated Lang-yao (sang-de-bœuf), Chi-hung (liquid-dawn red), Sung-Chien-yao (black with silver streaks and dead-leaf dappling), and Ming-Chien-yao (ivory-white); nor can it be denied that beautiful, though not completely successful, specimens in these special lines are manufactured to-day. What the last exhibition shows, however, is that, contrary to the predictions of many connoisseurs, the grand blue sous couverte of the Kang-hsi and Yung-ching eras can now be obtained in all its deep, lustrous purity by Japanese artists, and that they can also "reserve" blue designs in a field of canary-yellow as successfully as did the greatest of Chinese experts in the golden eras of the seventeenth and eighteenth centuries. It remains for them to achieve the Yung-la egg-shell and the soft-paste Kaipien-yao; but truly, looking at the feats they have already accomplished, it would be rash to predict failure for them even in these unique porcelains.

Independently of the interest attaching to this story of artistic progress, it has a moral, namely, that the time has come for Western collectors seriously to compare their unreasonable esteem for "old curios" with their indifference to the beautiful products of modern Japanese art. There are, indeed, a few special objects of which the finest types belong to bygone days. But, on the other hand, there are many modern works which are quite without rivals in the past. It is not only senseless that the amateur should cling to his conservative fancies, but it also exposes him to be the victim of perpetual deception, for, if the Japanese of the Meiji era can surpass their predecessors, they are evidently able to imitate them, and they will not cease to imitate them for the special benefit of the shallow collector so long as a mere pretence of age enhances the pecuniary value of a specimen in his eyes.

REGISTRATION IN CALIFORNIA.

A LAW has been enacted in California to regulate the practice of architecture, and under its provisions a State Board of Architecture has been formed and rules adopted for the guidance of the members of the profession in taking out licenses. There are ten members of the board, all appointed by the Governor of the State. Five of them are residents of the northern part of the State and the other five of the southern part, and all must be members of a "chapter of the American Institute of Architects or some similar institution or association of architects." The term of office is four years, except in the case of four members of the original board, who have been appointed for two years. The members serve without compensation from the State, and the expenses are raised by fees collected from applicants for certificates to practise. The officers of the present board are as follows:—President, Octavius Morgan, Los Angeles; vice-president, Seth Babson, San Francisco; secretary and treasurer, Merritt J. Reid, San Francisco; assistant secretary and treasurer, Fred H. Roehrig, Los Angeles.

For administrative purposes the State is divided into Northern and Southern Districts, with offices at San Francisco and Los Angeles respectively. The members from the two

sections, five from each, are grouped into district boards, each having a seal distinct from that of the whole board. The latter meets once a year regularly, and on other occasions at the written request of four members and after twenty days' notice. The district boards meet at their offices on the last Tuesday of January, April, July and October of each year for the examination of the applicants for certificates to practise, and at such other times and places as they may elect.

Any person is entitled to such an examination on payment to the district board of a fee of 15 dols. If the examination is passed a further fee of 5 dols. must be paid to the secretary for an official note of the fact, addressed to the Secretary of State. On the presentation of this note to the latter officer and the payment to him of another 5 dols. fee the candidate will receive a certificate or license to practise, containing a statement of his full name, birthplace, age and the district board before which he appeared.

Any architect in good standing who can prove to the satisfaction of the board of the district in which he resides that he was practising his profession on the date of the passage of the Act will be granted a note of this fact without any examination on payment to the board of 5 dols., provided the application is made within six months of the passage of the Act. On receipt of this note and another fee of 5 dols. the Secretary of State will issue a certificate stating that the person named is authorized to practise.

Every licensed architect must have his certificate recorded in the office of the recorder of every county in which he practises, the fee being the same as for recording deeds. A failure to have a certificate so recorded is sufficient cause for revoking it.

The penalty section of the Act establishing this system of licenses is as follows:—"After the expiration of six months from the passage of this Act, it shall be unlawful and it shall be a misdemeanour punishable by a fine of not less than 50 dols. nor more than 500 dols., for any person to practise architecture without a certificate in this State, or to advertise, or put out any sign or card or other device which might indicate to the public that he was an architect, provided that nothing in this Act shall prevent any person from making plans for his own buildings, nor furnishing plans or other data for buildings for other persons, provided the person so furnishing such plans or data shall fully inform the person for whom such plans or data are furnished that he, the person furnishing such plans, is not a certificated architect, provided that nothing in this Act shall prevent the employment of an architect residing out of the State of California to prepare plans and specifications for buildings or other structures within the State, conditioned, he shall present satisfactory evidence to the board of the district in which the structure is to be erected that he is a competent architect, when such board shall issue to such architect a temporary certificate for such employment upon the payment of a fee of 5 dols. Architects' certificates issued in accordance with the provisions of this Act shall remain in full force until revoked for cause, as hereinafter provided for in this Act. A certificate may be revoked for dishonest practices, or for gross incompetency in the practise of the profession, which question shall be determined by the district board of the district in which the person whose certificate is called in question shall reside, or shall be doing business, and upon a full investigation of the charges by the district board, an opportunity having been given the accused to be heard in his own defence or by counsel, and upon the verdict of at least four members of the district board, the board may issue its certificate to the Secretary of State revoking the certificate of the person accused, and the Secretary of State shall thereupon cancel such certificate. And on the cancellation of such certificate it shall be the duty of the secretary of the district board to give notice of such cancellation to the county recorder of each county in the State, whereupon the recorder shall mark the certificate recorded in his office 'cancelled.' After the expiration of six months, the person whose certificate was revoked may have a new certificate issued to him by the Secretary of State upon the certificate of the district board by which the certificate was revoked."

All plans issued from the office of a certificated architect must be impressed with a seal having his name and place of business, and the words "certificated architect." A rubber stamp is not sufficient.

Each member of a firm practising in the State must have a certificate.

The rules concerning examinations recently adopted by the board read as follows:—

The regular class examinations shall occupy not less than two days. One day at least shall be devoted to written examinations, and one day shall be devoted to ascertaining the ability of the candidate to make practical application of his knowledge in the ordinary professional work of an architect, which will include an effort toward ascertaining the qualifications of the applicant in draughtsmanship and also in design, in construction and in the art of planning and rendering.

A diploma of graduation from the full course in architecture or architectural engineering in any university or technical school, approved by the board, may be accepted as satisfactory evidence of a competent knowledge of architectural design and construction required for a certificate to practise as an architect in California according to law; provided that in such case the applicant for examination shall present evidence satisfactory to the board to show that he has acquired the ability to successfully apply his knowledge to the design and construction of buildings and to supervise the execution of work.

The subjects upon which the applicants for a certificate of competency to practise architecture shall be examined are as follows:—

Demonstration of ability to make practical application of knowledge in the ordinary professional work of an architect, as follows:—1, Merit as investment; 2 planning; 3, construction; 4, design; 5, rendering.

Materials and construction of buildings, eleven subjects, as follows:—Foundations, concretework, stone masonry, mortar, brick masonry, structural iron and steelwork, carpentry, joinery, sheet metalwork, plastering, painting.

Strength of materials, eight subjects, as follows:—Tension, compression, shearing, transverse strain, structural columns, floor beams, girders, trusses.

Sanitation, three subjects, as follows:—Plumbing, heating, ventilation.

Electrical construction as applied to buildings.

Supervision of all the foregoing subjects as applied to buildings.

Each subject of each subdivision shall be graded by the committee on examinations, and the applicant whose grading shall be 75 per cent. or over shall be entitled to a certificate of competency.

TUNNEL BETWEEN SCOTLAND AND IRELAND.

A PAPER was read by Mr. James Barton, C.E., on "The Proposed Tunnel between Scotland and Ireland," at the International Engineering Congress, Glasgow, on the 5th inst. The first question, he said, to be considered was the selection of a site for the tunnel. Three positions suggested themselves. First, the nearest approach of Great Britain to Ireland was at the Mull of Cantyre, where the distance to the co. Antrim was 12½ miles. The next position in point of distance was from Wigtownshire, where the Scotch coast came within 21 to 25 miles of Ireland. The third position was from Holyhead to Howth. The maximum depth of water on the Cantyre route was 460 feet, on the Wigtownshire route the depth varied according to the line selected and was from 480 to 900 feet, and the greatest depth on the Holyhead route was 432 feet. The strata of the Cantyre route were lower Silurian; on the Wigtownshire route to Antrim, Silurian for the most part, but overlaid near the Irish coast by new red sandstone and the Keuper marls; between Wigtownshire and the co. Down, lower Silurian throughout; from North Wales to Dublin would be in the Cambrian rocks. The first of these positions had to be abandoned on account of its not forming a practically useful connection. The second formed a direct line between Carlisle and Belfast, the business centre of Ireland, and gave the best route from Scotland to all Ireland, and for the North of England to Ireland. The third route would connect London best with Dublin, but would be of little use as between Scotland and Ireland, and being more than double the length of the second route it had to be abandoned, and the second route adopted for the present project. On the second route two lines were considered—one from Portpatrick, Wigtownshire, to Donaghadee, co. Down; the other from near Corsewall Light to the co. Antrim, with a curve in the centre to pass round the north end of the Beaufort Dyke, a deep valley or gorge in the bottom of the sea, which runs for thirty miles north and south seven miles from the Scotch coast. The channel bed north of this dyke was comparatively level. A tunnel under Beaufort Dyke would involve very serious difficulties and probably dangers. The tunnel line adopted begins at the Stranraer railway station, and, passing north, enters the tunnel at five miles, and, descending 1 in 75 passes under the shore line at the Ebbstone Beacon at nine miles; it passes round a curve of a mile radius at the head of Beaufort Dyke at 16 miles, and reaches the shore line at Island Magee, co. Antrim, at 34 miles rising 1 in 75 from the deep water, and, passing out of the tunnel at 39½ miles, it joins the Belfast and Northern Counties Railway at 41 miles, and runs 10½ miles along it into the terminus at Belfast. The total length from Stranraer to Belfast was 51½ miles, of which 34½ was tunnel and 25 of this under the sea. To provide suitable drainage the line fell each way from the centre, and drainage heading would have to be run to the shafts at each side, where pumping stations would be placed. Subsidiary shafts were proposed at

a short distance inland, and would in connection with the main shafts enable specially accurate lines to be given for the tunnel. The geological formations had been reported on by Professor Hull, late director of the Geological Government Survey of Ireland. The top of the tunnel was proposed to be placed 150 feet below sea bottom, and the tunnel was to be for a double line. The principal operation, and that which controlled the time of execution of the whole work, was the heading. The heading proposed was 10 feet wide by 7 feet high. The heading through the Silurian should be as rapid as those now being made in the Simplon Tunnel; those in the Keuper marls more rapid; and the whole heading could, it was believed, be completed under ten years, and the finished tunnel between eleven and twelve. The top of the tunnel was proposed to be placed 150 feet below sea bottom, and the tunnel was to be for a double line. Improvements in rock drilling in the Alpine tunnels had been remarkable of late years. The maximum speeds of Alpine tunnels were as follows:—

Cost of tunnel
per yard complete.

Mont Cenis, maximum speed per day, 6 yards	... £224
St. Gothard, maximum speed per day, 10 yards	... 142
Arlberg, maximum speed per day, 12 yards	... 107

The Simplon heading had so far been faster than the Arlberg and in a very hard rock. The amount of water to be dealt with was the one uncertainty, though there were grounds for believing it was not likely to be a very serious difficulty. The Severn and Mersey tunnels encountered no serious water leakage under the sea, the great leak of the Severn tunnel being from fresh water and a quarter of a mile from the sea. Judging from these tunnels, and a tunnel driven under the Forth, there seemed good ground for believing that the sea-bed under the Irish Channel had probably sealed all interstices, so that excavation might be expected to be fairly dry. The working of the line from Stranraer to Belfast was proposed to be by electric motors from installations near the main shafts, one at each side of the Channel; and it was intended that trains should be run at a speed of 60 to 70 miles per hour, so that the time in the tunnel would be a little over half an hour, and the whole distance between Stranraer and Belfast would be traversed in less than an hour. The ventilation of the tunnel was rendered easy by the use of electric power. The cost of the tunnel was estimated by the engineers and by a contractor at 10 millions, exclusive of interest during construction, and this left a considerable margin for contingencies. The finance of the project was the present difficulty, the prospect as a speculation not being sufficiently good. The subject had been brought before the Government as an imperial one, and a small guarantee was asked for. Mr. Balfour expressed himself desirous of seeing the project carried out, and was willing, if the amount of capital could be definitely fixed, to bring the subject before his colleagues. Until a heading had been run from the Irish side past the junction between the sandstone and Silurian, no contractor was willing to undertake the tunnel at a fixed sum; to do this, however, would probably not cost more than half a million, and the cost of a heading through the whole 34 miles was estimated at 2½ millions.

Mr. J. Mansergh said he had recently been driving 10 or 12 miles in Silurian, and in some of the tunnels they had had a good deal of water. Probably under the sea the interstices would be filled up with matter that would prevent water coming through, and it was on the cards that there would be less water in a tunnel of this sort than in the open surface.

Mr. F. W. McCullough said that as far back as 1886 he took considerable interest in schemes for a Channel tunnel, and after examining all the routes that appeared to him to be feasible in the district, he early in 1890 brought forward a scheme of a direct tunnel from Whitehead to Portpatrick. It was after this that Mr. Barton brought his scheme before the public, and he considered that any proposed scheme for an Irish tunnel rather reasonably and fairly compared with other schemes that were in existence. It was not a matter for any individual to seek credit for introducing a scheme that in reality was a borrowed one; for he contended that the route suggested by Mr. Barton was entirely within the limits of the scheme mentioned by him in 1890. When Mr. Barton first proposed his scheme the length of the tunnel was given at 26½ miles, whereas the length of the marine tunnel was now 25½ miles. The Whitehead tunnel was almost two miles shorter than Mr. Barton's scheme, and the whole length of the line from Whitehead was only 31 miles, while that of Mr. Barton was 41 miles, so that the Whitehead proposal showed a difference of 10 miles. The ruling gradient in the scheme before them was 1 in 75, while the ruling gradient of the Whitehead and Portpatrick tunnel was 1 in 58, and he therefore held that that route had important advantages over any longer route. It could be more easily constructed, for although the greatest depth of water on the Whitehead route was 650 feet, as compared with 450 feet in Mr. Barton's scheme, that only affected the question generally in a matter of

gradients. He considered that a gradient of 1 in 58 was not extreme, inasmuch as he had travelled on railways in Scotland where at places the gradient was 1 in 45. Until some more definite knowledge was had regarding the geological difficulties to be contended with, the advantages showed the Whitehead and Portpatrick to be the more practical one.

Mr. Leonard Bell said he had to drive seven or eight miles of tunnel through the Silurian in connection with the Mourne Waterworks, and he did not think that the tunnel could be cut at the rate Mr. Barton hoped. Two yards per day was considered good work in a heading of 8 feet by 8 feet. As to the gradients of 1 in 75 there were much heavier gradients—1 in 50—in the Simplon Tunnel. But as a special electrical engine would be employed he did not think the heavier gradients would be a very serious objection. He also suggested whether, in order to prevent any trouble from water, it would not be better to divide the tunnel into two tubes or cylinders, something like the electrical railways in London.

Sir Douglas Fox said that since Mr. Barton came to him two or three years ago he had taken a deep interest in this question. It was one of national importance, inasmuch as the position of the tunnel would really connect the two commercial centres of Glasgow and Belfast. As to the suggestion of the last speaker that two single tunnels should be adopted, there was a good deal to be said, and it was worthy of consideration whether it would be desirable to adopt two single tunnels with a heading between. But that was a matter of detail. Mr. Bell had stated that he had been working in the Silurian, and had only got two yards a day. That might be perfectly true, but the whole question resolved itself into whether thoroughly good arrangements had been made as to plant and that there was plenty of power. They had the practical results at the Simplon, where the material being cut through was harder than any Silurian he had ever seen, and yet that was proceeding at the rate of 22 feet per day. They might fairly assume that if this tunnel was sanctioned they would make even greater progress than had been accomplished in the Simplon. His brother had only recently returned from the Simplon tunnel, and the speed attained was 22 feet per day in a heading 11 feet by 8 feet. As to Mr. McCullough's scheme for a tunnel from Whitehead to Portpatrick, he just got into the very difficulty they had tried to avoid. It would be, of course, very pleasant to run straight across the channel without that curve which was in the proposed tunnel. But he was strongly of opinion, from his experience in tunnelling the Mersey and elsewhere, that it would be a risky operation to go across that chasm which had been ploughed out in the bed of the channel. It was far better, as Mr. Barton proposed, to avoid that difficulty and go round the northern head of the chasm. When the Mersey tunnel was made it was feared by some that the water would percolate through the river into the workings, which were only 25 feet below the bed of the river. The fact was that no water came direct from the river; all the water that was pumped out came from the land. And, so far as the difficulty of making this Irish Channel tunnel was concerned, he would face it with much more composure than when he looked at the Mersey and knew what had to be dealt with there. In fact, this tunnel could be made with greater ease than either the Mersey or the Severn tunnels. Then as to the cost. The cost of the Simplon tunnel when completed would be about 60% per lineal yard for a single line, and doubling that for a double line would be about 120% per lineal yard, and he considered that the result attained at the Simplon was wonderful. He also believed it could be made quicker.

Professor C. A. Carus-Wilson said the gradients, which were 1 in 75, were a much more serious matter than might at first sight appear. High speed was evidently a great feature of the scheme, inasmuch as the author of the paper spoke of attaining 60 miles an hour. To attain that speed with a 100-ton train up a gradient of 1 in 75 would require a locomotive of something like 800 or 1,000 horse-power. He considered it would be almost impossible to get 60 miles an hour up that gradient, and that it would not be economical to attempt to do it. Any attempt to increase the gradient would have a still further effect on the speed. Another point in connection with the speed was the effect that a break in the straight line would have.

Sir Douglas Fox remarked that the curve would not have any effect on the speed.

Mr. Barton, in reply, said he would be sorry if there was anything in his paper that might imply that he had taken from anybody any special credit that was due to him.

The chairman (Sir B. Baker) said that whatever might be their views as to this scheme, yet in its social, political and commercial aspect it could not be over-estimated. It would be what he might call the readiest means of bringing to a successful issue what had troubled the people of this country for many years—it would be an engineering solution of the Home Rule question. It would do more than anything else to cement the three countries together.

ARCHITECTURAL EDUCATION.

AT the recent convention of the Architectural League of America, short papers were presented by representatives of the various clubs composing the League, treating of different phases of the subject of the proper education of architects, which had previously been assigned to each club for consideration. For the Toronto Architectural Eighteen Club, Mr. Wm. Rae contributed the following as the views of the club on the questions submitted to it, which were:—

"How much mathematical and engineering training should an architect have?"

"Should design and construction be separated so as to train specialists in each of these lines?"

(a) An architect should have as much mathematical and engineering training as will enable him to solve, by means of formulas derived from the experimental research of scientific experts, every problem the erection of a modern building may involve in the safe and economical use of the materials of its construction, including steel construction, heating, lighting, ventilation and sanitation.

In considering this question we have borne in mind the difference between education and merely a knowledge of the expedients of modern practice, for these expedients vary so much in different localities and change so from time to time, so many men devising their own and ever learning fresh ones, that we think no rule may be laid down concerning them.

The use of formulas and tables thus derived we think one of the most justifiable expedients of modern practice.

The architect's work is the harmonious association of all the crafts, which harmony can only be considered complete when the possibilities of each craft in relation to the whole are perfectly developed, and to do this a knowledge of the nature and functions of every material used is necessary.

(b) Design and construction should not be separated, so as to train specialists in each of these lines, because a specialist is one who, in addition to the ordinary knowledge of his craft, acquires a special knowledge of one line, not one who has acquired a knowledge of one line only of the general knowledge of his craft.

Design in architecture is surely, as seen in the study of the highest design—the human figure—constructing beautifully. Certainly, the most intellectual part of the æsthetic satisfaction derived from the contemplation of the human figure comes from the perception of the harmonious grace of its constructional requirements.

Could we imagine a figure built up of compression members covered with tension members and concealed beneath a coat of ornament?

What we understand by architectural design has to be based upon the use of some material; to what material shall we limit it? Stone and wood only? We do not know what the material of the future may be; there may be no stone or wood. Times change, and we must change with them.

CAWOOD CASTLE.

THE village of Cawood is conveniently situated on the banks of the Ouse, about five miles above Selby. Like Sherburn, says Mr. B. Milnes, it was given to the Archbishops of York in the tenth century. At first there was only an ordinary manor-house, and we do not hear much of it before the end of the thirteenth century, though many of Walter Gray's documents are dated there. Archbishop Gifford (1266-76) obtained Henry III.'s permission to pull down the house and to rebuild it as a castle. In time it became a very strong fortress, and this gave it a political as well as ecclesiastical importance. In the then disturbed state of the north, and frequent fighting which prevailed, it was convenient for the archbishops to have a fortified stronghold to which they could retire, and this, added to its convenient position on the river, was doubtless the reason why it became one of most magnificent hospitality. If "His Grace of York" wished to entertain on a royal scale he chose Cawood Castle for the purpose. Henry III. and Queen Eleanor were lodged here on their way to Scotland in 1255. In 1299 it acquired still greater fame as a royal residence when Edward I. left his Queen there from 1299 to 1304 while he was fighting against the Scots, returning to spend each winter with her. Here Edward II., during his troubled reign, often sought a refuge in the home of his happier childhood. Alexander Neville considerably enlarged the Castle in Richard II.'s reign, and Henry Bowet (1407-23), famous for his magnificence, built the great hall. Cardinal Kempe (1426-52) spent much money on the place, and it seems to have been his favourite residence during his twenty years' tenure of the see. The gateway, which is almost all that is left, still bears his arms, with the cardinal's hat. He was succeeded by Geo. Neville, the elder brother of Warwick, "the King maker," whose installation feast on January 15, 1466, has become proverbial. Leland has preserved an account of it: he gives a list of all the chief guests and their arrangement at the different tables,

with a wonderful menu of the courses at the banquet. It is calculated that some 1,800 persons were present. A full description of it is given by Dean Purey-Cust in his magnificent "Heraldry of York Minster." He shows that it was really a great political demonstration against King Edward IV., who doubtless remembered it. A few years afterwards he seized the archbishop's estates and banished him to France. Archbishop Rotherham died of the plague at Cawood in 1500, and his successor, Savage, also died here in 1507. The Castle became famous again as the scene of poor Wolsey's arrest. Here it was that he spent what were almost the last few quiet weeks of his eventful life, with "a peace above all earthly dignities, a still and quiet conscience," preparing for his installation in the minster, which never took place. He died a few days after he had left, on November 29, 1530, at Leicester Abbey.

Cawood continued for many years to be the occasional residence of the archbishops, though its old glory was gone. George Montaigne, a native of the place, died here in 1628, only a fortnight after his enthronement, and his monument remains in the parish church. Williams was the last archbishop to occupy the Castle. In July 1642 it was surrounded by the Parliamentary troops, and he had to fly for his life by night. It was dismantled in 1646 by Act of Parliament, along with several other Yorkshire castles, and has since been a gradually diminishing ruin. The property remained in possession of the archbishops of York until 1882, when it was taken over by the Ecclesiastical Commissioners. The old manor court is still held every year in a room over the gateway.

GENERAL.

The Clarence Memorial Church at Craigydun, Llandudno, has been consecrated. It was designed by Mr. Oldrid Scott, and was built in sections. The nave was opened in 1895, the memorial-stone having been laid by H.R.H. the late Duchess of Teck. The two side aisles were added in 1899. The style is that of the thirteenth century.

The Town Clerk of Liverpool has been instructed to communicate with the architect of the Central Technical School with the view of urging the contractors to finish the work, so that the classes might be fully accommodated during the ensuing session.

A Window, which is believed to be one of the very few fragments of pre-Norman church architecture remaining in the Principality, has been discovered in the course of the restoration of Llandenny Church, near Usk. The opening is only 3 inches wide, the inner splay broadening considerably.

Mr. John Rochester Thomas, the New York architect, died suddenly at the Thousand Islands on August 27. He was born in 1848. He opened an office in New York in 1882, and soon built up a large practice. The Elmira Reformatory, the Eighth Regiment Armoury and the double-storey drill-halls of the Seventy-First Regiment Armoury in New York, and the Rahway Reformatory are a few of his leading works. In 1896 his designs for a new city hall in New York were awarded first prize among the 133 submitted in competition, but the Legislature stopped their execution.

The Chief Rabbi on Sunday reconsecrated the Hampstead Synagogue which has been enlarged, and consecrated a new synagogue at Finsbury Park. The architect for both works was Mr. Delissa Josephs.

The Death has occurred of Mr. Charles Dorman, senior member of the firm of Messrs. Charles Dorman & Son, architects and surveyors, Northampton. Mr. Dorman, who went to Northampton from Uppingham, started business in 1882, and in 1897 he took his son into partnership with him. He was architect for many large and prominent industrial buildings in Northampton. Mr. Dorman was in his sixty-third year.

The Ontario Government has rejected the proposal of the City Council of Toronto that the proposed statue of Queen Victoria should be placed on the main approach to the Legislative Buildings, midway between the statue of the late Sir John Macdonald and the buildings. The Government claim that the statue should occupy the foremost and most prominent position.

A Meeting has been held at Gainsborough to consider the question of enlarging the church of St. John. The population of the parish is now 5,196, an increase of about 1,800 during the past ten years, and it is obvious that a church with a seating accommodation for only 450 is not adequate. The vicar (the Rev. F. W. Hutchinson) presided, and explained the two schemes submitted by the architect. One was to add an aisle on the north side and the other to lengthen the nave by three bays. The last-named scheme, which was estimated to cost from 2,500*l.* to 3,000*l.*, was considered the most practical as it provided seats for 240 more people.

Mr. H. E. Lloyd, a well-known Redditch architect, died yesterday morning of poison accidentally administered. He was confined to his bed with a cold and was given carbolic acid in mistake for his medicine.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

IRELAND.—Sept. 21.—The Roscommon Rural District Council invite plans for cottages, which would not cost more than 110*l.* Mr. T. J. O'Keeffe, clerk to the Council.

ST. PETERSBURG.—Sept. 14.—Building projects are invited for the permanent Palais and Ochta Bridges (and their connections with the banks), to be erected over the Great Neva River. Particulars will be supplied by the St. Petersburg Town Council.

SHEFFIELD.—Sept. 30.—Designs are invited for a Memorial to Her late Majesty, Queen Victoria, on the site now occupied by the monolith in Fargate, such Memorial to include a statue of Her late Majesty. Prizes of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the three best of the unsuccessful competitors. Messrs. Wm. E. Clegg & George Franklin, honorary secretaries, Town Hall, Sheffield.

CONTRACTS OPEN.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., or personal application.

BARNSELY.—For erection of a chimney about 90 feet high and an engine-house, and for the seating of two Lancashire boilers. Plans, &c., at the offices of the Barnsley Coal and By-Products Company, Limited, Smithies, Barnsley.

BARNSELY.—Sept. 16.—For erection of an entrance lodge; a new main ward block to contain twenty-eight beds, with duty-room, heating chamber, heating apparatus, &c.; additions to administrative block, additions to laundry, fence walls, &c. Mr. J. Henry Taylor, surveyor, Manor House, Barnsley.

BARNSELY.—Sept. 17.—For erection of a villa in Park Grove. Mr. Charles L. McLintock, architect, 28 Church Street, Barnsley.

BARNSTAPLE.—Sept. 23.—For extension of the Imperial hotel. Mr. W. C. Oliver, architect, Bridge End, Barnstaple.

BERWICK-ON-TWEED.—Sept. 24.—For erection of a villa at Norham. Mr. J. L. Murray Sherriff, East House, Norham.

BIRMINGHAM.—Sept. 16.—For building two cottages and extension of farm buildings. Messrs. Whitwell & Sons, architects, 23 Temple Row, Birmingham.

BOWNESS-ON-SOLWAY.—Sept. 17.—For erection of a concrete wall at the west end of the village of Bowness, in the parish of Bowness-on-Solway. Mr. William Brown, surveyor, Bowness-on-Solway.

BRISTOL.—Sept. 14.—For erection of warehouses, &c., in John Street, Little John Street and Tower Lane. Mr. Henry Williams, architect, Imperial Chambers, Corn Street, Bristol.

BRISTOL.—Sept. 30.—For erection of an infants' school and special class centre at Wilson Street, St. Paul's. Messrs. Philip Munro & Son, architects, 6 St. Stephen's Chambers Baldwin Street, Bristol.

BROMLEY.—Sept. 24.—For alterations and additions to the mortuary buildings at the sick asylum at Devons Road, Bromley, Middlesex, E. Messrs. J. & S. F. Clarkson, architects, 136 High Street, Poplar, E.

BURLEY-IN-WHARFEDALE.—Sept. 16.—For erection of a dwelling-house, &c., at Burley-in-Wharfedale, Yorks. Mr. D. Dodgson, architect, 86 Albion Street, Leeds.

CALAIS.—Sept. 20.—For works in connection with a lock-gate and aqueduct at Calais, including the construction of the coffer dam, the masonry of the lock and the aqueduct. M. Thanneur, ingénieur-in-chef, à Boulogne-sur-Mer.

STURTEVANT

SYSTEM OF Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,

147 QUEEN VICTORIA STREET, LONDON.

GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

COVENTRY.—Sept. 18.—For erection of offices, extension of factory, &c., at Great Heath, Foleshill. Mr. Herbert W. Chattaway, architect, Trinity Churchyard, Coventry.

DOVERCOURT.—For erection of nine houses at Dovercourt, near Harwich, Essex. Mr. R. G. Kestin, 1 Colosseum Terrace, N.W.

DUNSTABLE.—Sept. 16.—For additions to the Upper Houghton Regis Board school. Messrs. J. R. Brown & Son, architects, Castle Street Chambers, Luton.

EDGWARE.—For erection of a house, Canon's Park Estate. Mr. H. M. Lawson, architect, 40 Broadway, Ealing, W.

EGGESFORD.—Sept. 18.—For repairs, &c., Eggesford Bridge. Particulars can be obtained at the office of the Council, at the Castle, Exeter.

ERITH.—Oct. 8.—For constructing sewers, screen chamber, &c. Engineer's Department, County Hall, Spring Gardens, London, S.W.

FIELD BROUGHTON.—Sept. 24.—For erection of a vicarage at Field Broughton. Messrs. Austin & Paley, architects, Castle Park, Lancaster.

GRESSENHALL.—Sept. 25.—For alterations and new structural work, hot-water heating, supply by rain and storage of water, engineering works, including boilers, cooking apparatus, laundry machinery, pumping engines and iron emergency staircase, &c., at the workhouse at Gressenhall, Norfolk. Mr. John B. Pearce, Upper King Street, Norwich.

GREAT YARMOUTH.—Oct. 1.—For erection of cemetery chapel, superintendent's lodge, office, toolhouse, entrance gates and fencing at Caister. Mr. J. W. Cockrill, borough surveyor, Town Hall, Great Yarmouth.

HALIFAX.—Sept. 27.—For erection of fourteen houses, &c., near Pellon, Halifax. Mr. Medley Hall, architect, 29 Northgate, Halifax.

HORNSEA.—Sept. 30.—For extension and removal of creosoted wood fencing at the cemetery, Southgate, Hornsea, Yorks. Mr. W. G. Warburton, surveyor, Public Rooms, Hornsea.

HOUNSLOW.—Sept. 30.—For erecting twenty-two houses for the working classes. Mr. P. G. Parkman, surveyor, Town Hall, Hounslow.

HUDDERSFIELD.—Sept. 16.—For erection of laundry, boiler-house, electric-light engine and power-rooms, pump-rooms, laundry residence, &c., in connection with the new

asylum now in course of erection at Storthes Hall, Kirkburton, near Huddersfield. Mr. J. Vickers Edwards, county surveyor, County Hall, Wakefield.

HULL.—Sept. 16.—For erection of offices and warehouse in Collier Street. Mr. Ernest Whitlock, architect, 26 Scale Lane.

INCE.—Sept. 21.—For building public offices for the Urban District Council. Messrs. Heaton, Ralph & Heaton, architects, Wigan.

IRELAND.—Sept. 16.—For erection of three villas and additions and alterations to existing house at Fahan. Mr. R. Eccles Buchanan, architect, Castle Street, Londonderry.

IRELAND.—Sept. 17.—For alterations to various rooms in the workhouse, the erection of water-closets in the male side of the infirmary, and the fitting-up of baths and wash-hand basins at Kerr's buildings of the Union workhouse, Belfast. Messrs. Young & Mackenzie, architects, Belfast.

IRELAND.—Sept. 17.—For construction of a new roof over the rink building (near the Great Northern hotel), Rostrevor, Dublin, and the execution of other works in connection therewith, for the Great Northern Railway Company, Ireland. Mr. Wm. James Watson, architect, Benvenue, Rostrevor.

IRELAND.—Sept. 18.—For alterations of two wards in the workhouse. Mr. Patrick Cuniam, clerk to the Guardians, Loughlinstown.

IRELAND.—Sept. 19.—For completion of the St. Patrick's parish church, Ballymacarrett. Mr. Samuel P. Close, architect, Donegall Square Buildings, Belfast.

IRELAND.—Sept. 20.—For erection of diocesan schools in Letterkenny. Mr. M. O'Callaghan, architect, Main Street, Letterkenny.

IRELAND.—Oct. 1.—For cementing walls, flooring rooms, painting and general repair at Shiels's Institution, Carrickfergus. Particulars from the Superintendent.

LAMBETH, S.E.—Sept. 18.—For extension of the kitchen accommodation at Prince's Road workhouse. Messrs. Woodward & Brooks, architects, 69 Kennington Oval, S.E.

LEEDS.—Sept. 16.—For erection of Primitive Methodist chapel at Woodhouse Hill. Messrs. Howdill & Howdill, architects, 7 Oxford Road, Leeds.

LEEDS.—Sept. 23.—For alteration of the coal stores at the Meadow Lane gasworks. Mr. R. H. Townsley, general manager, Gas Offices, Dewsbury Road.

Fields Estate. The Architect's Department, L.C.C., 18 Pall Mall East, S.W.

TYLDESLEY.—Sept. 23.—For erection at the gasworks, Tyldesley, of an iron shed with corrugated iron roof, for the coal store. Mr. Wm. J. Matthews, clerk to District Council, Council Offices, Tyldesley.

WALES.—Sept. 16.—For alterations and additions to Hafodyrnyns inn, near Crumlin, Mon. Mr. R. L. Roberts, architect, Abercarn.

WALES.—Sept. 16.—For building 200 houses at Dowlais. Mr. W. Dowdeswell, architect, John Street, Treharris.

WALES.—Sept. 18.—For building new harbour offices. Mr. T. Strick, Harbour Offices, Swansea.

WALES.—Sept. 18.—For alterations and renovations at the Ogmere Valley hotel, Tynwydd. Messrs. Cook & Edwards, architects, Masonic Buildings, Bridgend, Glam.

WALES.—Sept. 21.—For erection of a schoolroom and master's house at Mynachlogddu, Clynderwen, R.S.O., Pembrokeshire. Mr. William J. Williams, clerk, 1 High Street, Cardigan.

WALES.—Sept. 24.—For erection of some twenty to thirty cottages at Treallaw. Mr. Arthur O. Evans, architect, Pontypridd.

WALES.—Sept. 26.—For erection of new schools and offices at Burry Port. Mr. Richard Williams, architect, Burry Port.

WALES.—Oct. 2.—For erection of a school at Brynmawr for 420 boys, and for converting the three departments of present schools into two departments and executing various repairs at the Brynmawr Board schools. Mr. F. Baldwin, architect, 13 Frogmore Street, Abergavenny.

WALES.—Oct. 10.—For erection of the proposed hospital for Pontypool and district on a site abutting Leigh Road. Mr. Robert Williams, architect, 10 Clifford Inn, Fleet Street, E.C.

WALES.—For erection of forty houses in the Western Valleys, Mon. Mr. C. Telford Evans, architect, 8 Queen Street, Cardiff.

WALTHAMSTOW.—Sept. 24.—For erection of a cookery-room, cloakroom, scullery, &c., at the Wood Street Girls' school, for the Walthamstow School Board. Mr. H. Prosser, at the Board's Offices.

WEALDSTONE.—Sept. 17.—For erection of a chapel in connection with the proposed new cemetery, the erection of an entrance lodge to the recreation-ground, the supply and erection of wrought-iron fencing and ornamental gates in connection with proposed new cemetery, &c. Mr. F. Hill Parr, surveyor, Council Offices, Wealdstone, Middlesex.

WEST HAM.—Sept. 24.—For construction of an underground sanitary convenience, Sebert Road, Forest Gate, E. Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham.

WHITSTABLE.—Sept. 27.—For erection of coastguard buildings at Whitstable, in the county of Kent. Quantities, &c., will be sent on application to the Director of Works Department, Admiralty, 21 Northumberland Avenue, W.C.

WIGAN.—Sept. 18.—For erection of a corrugated iron building within the workhouse grounds, to accommodate children in the workhouse. Mr. Henry Ackerley, clerk, 9 Victoria Buildings, King Street, Wigan.

WILLESDEN.—Sept. 24.—For erection of main generating station and sub-station and offices in connection with proposed electric-lighting scheme for the district. Mr. O. Claude Robson, engineer, Public Offices, Dyne Road, Kilburn, N.W.

WOOLWICH.—Oct. 3.—For erection of reception-house for dead bodies upon a site adjoining St. John's Church, Eltham. Mr. Frank Sumner, borough surveyor, Maxey Road, Plumstead.

WREXHAM.—Sept. 16.—For erection of a division wall and lights at the end new shed in the vegetable market. Mr. J. Oswald Bury, clerk to the markets committee, 9 Temple Row, Wrexham.

MESSRS. W. H. LASCELLES & Co. beg to thank their many friends who have expressed their sympathy, and offered practical assistance, in their difficulties arising from the disastrous fire on Saturday last. They have secured the premises recently occupied by Messrs. W. Scrivener & Co., which, with their own premises at Stratford, will enable them to continue their joinery business without any delay. Communications are still to be sent to their old address, 121 Bunhill Row, London, E.C., as the offices have escaped serious injury. The "Lascelles'" concretework and other departments which are carried on at their Stratford premises are not interrupted.

THE technical college which has been erected by the Corporation of Sunderland on a commanding position on The Green was opened on the 6th inst. The building is of red brick, a square tower, capped by a dome, being a feature at the south-west corner. The building is in the English Renaissance style. In the basement the physical laboratory, the heating apparatus, working machinery, testing machines and workshops are situated; on the ground-floor is the examination and lecture-hall, 70 feet by 30 feet. On the first floor are the chemical laboratory, 70 feet by 30 feet and 28 feet high, and the chemistry lecture theatre, with accommodation for eighty-four and sixty students respectively. Rooms for astronomical study are on the second floor and in the tower. Projecting from the latter is a handsome clock after the pattern of that in the old Tolbooth, Edinburgh. The cost of the site, building and furnishing will be about 21,000*l.* or 22,000*l.*

In BRASS, BRONZE, and other Alloys.

VARIETIES.

RHESYCAE parish church, Flintshire, has been reopened after extensive improvements, which have cost about 200*l*.

A NEW Congregational church, to seat 500 persons, erected at Swinton, near Sheffield, at a cost of 2,200*l*., was opened on the 5th inst.

IN the Public Works Office, Ireland, Messrs. G. W. Crowe and E. Twist have been appointed assistant surveyors of buildings.

THE Duke and Duchess of Devonshire have given 500*l*. towards the restoration of St. James's Church, in Dale Road, Buxton, and a site for another to be called St. Mary's. The total expenditure for church extension in the district is expected to reach something like 20,000*l*.

LIQUID air is being used in Germany as a blasting agent. Under the name of oxyliquid liquid air is absorbed by some suitable material, and introduced into paper cartridges filled with an oily mass. They are fired by the electric spark or by a Bickford fuse. The effect is said to be equal to that of dynamite. If a cartridge misses fire it becomes harmless in a quarter of an hour, owing to the rapid evaporation of the gas.

CONSIDERABLE extensions are being made to the Shoreditch Town Hall in order to render it sufficiently important to worthy shelter and provide accommodation for the new Borough Council. The contract price for the addition is 21,833*l*., and the land cost 4,550*l*., the funds being provided by a loan from the London County Council. The ceremony of laying the foundation-stone of the extension was performed on Tuesday.

A NEW chapel which has just been erected by the Primitive Methodists at the corner of Camp Street and Great Clowes Street, Broughton, was opened for public worship on the 4th inst. The building takes the place of the old chapel in Blackfriars Street (which has been sold), and affords accommodation for 450 people. It is in the Renaissance style, designed by Messrs. Sankey & Cubbon, of Manchester, and has cost about 7,400*l*.

NEITHER Wasdale nor Lullington possesses, it appears, England's smallest church. The village of Upleatham, near Saltburn, North Yorkshire, claims this honour, for its church measures only 17 feet 9 inches by 13 feet 9 inches. It was measured last year by a Frenchman, who said it was smaller than the smallest church in France by 4½ inches. The church

dates back about 900 years, and except the top of the tower is absolutely covered with ivy.

ONE of the oldest Wesleyan chapels in Sunderland is to make way for business premises. It is situated in Fawcett Street, one of the town's most busy thoroughfares, and the closing sermons were preached on Sunday. A new chapel has been built on the Durham Road to accommodate the displaced congregation. The old edifice was erected in 1838, and was for thirty years the only Wesleyan quarters on Wear-side. There are now three circuits working from the town.

THE new church erected for Ruthneston United Free congregation, Aberdeen, was opened last week. The edifice is erected in front of and connected with the existing church buildings in Broomhill Road, and the old church is to be transformed into a hall and other adjuncts for congregational purposes. The new building possesses the Gothic features of the original structure. The church with its gallery will accommodate 750 persons. The cost is about 4,000*l*.

ACCORDING to the Vienna *Politische Correspondenz* the Turkish Government has ordered the construction of four new lighthouses in the Red Sea, namely, at Dschebel-Zubeir, at Abn-Ail, at Muscha and on the island of Dschebel-Tir. Lighthouses at these places have long been an urgent necessity to mariners, who will doubtless welcome the news that they are at last to be constructed. The contract has been given to a French company, which has undertaken to complete all four lighthouses by the first day of January, 1905.

SOME time ago the Postmaster-General acquired a site in Linlithgow for the erection of a new post-office, the accommodation in the present premises being quite inadequate to meet the requirements of the town. The site is at the east end of the town and in close proximity to the railway station. The site is a desirable one, and has now been surveyed with the view of having the necessary plans prepared. In addition to this the authorities contemplate the establishment of a sub-post and telegraph office at Blackness, which is increasing in popularity as a summer resort.

THE public baths which have been erected at the corner of Church Street and Summertown Road, Govan, N.B., were formally opened to the general public on Saturday. They are equipped in a manner unsurpassed in Scotland. Both the ladies' and the gentlemen's swimming ponds are of the regulation size, 75 feet by 35 feet, the former having a depth of from

2 feet 6 inches to 4 feet 4 inches, and the latter from 4 feet 3 inches to 7 feet 3 inches, with a diving ladder 13 feet high at the deep end. The scheme involves a capital expenditure of between 24,000*l.* and 25,000*l.*

MR. HENRY YOUNG, founder and engineer of the Eccleston Iron Works, Pimlico, who has for the last ten years resided at Bexhill-on-Sea, has, in his position of vice-chairman of the Council, done much to advance the interests of the town, and his popularity with all classes is evidenced by his invariable return at the head of the poll. A further proof of the esteem in which Mr. Young is held was furnished last week, when a deputation waited upon him to request him to become—in the event of the efforts to obtain the incorporation of Bexhill proving successful—its first Mayor, but it is now definitely known that Bexhill will not receive its Charter of Incorporation this year.

THE new central fire station at Scarborough was officially opened by the mayoress (Miss Darley), who also formally opened the new sub-fire station on the South Cliff, this ceremony being performed by aid of the telephonic communication between the two stations. The central station is a handsome building, situate on North Marine Road, and the estimated cost of the structure was 3,000*l.* The accommodation is in every way up to date and the appliances which have been procured are such as no town, equal in size to Scarborough, can surpass. There are now two patent currie fire-escapes, specially built hose-carts, hose-reels and other appliances, and also a steam fire-engine, which is capable of discharging 350 gallons of water per minute and of throwing it to a height of 160 feet through a 1½-inch jet.

GREYFRIARS United Free church, Aberdeen, which has been undergoing reconstruction for the past ten months, has now been reopened. The alterations have completely modernised the building. Underneath the church two halls and three classrooms have been formed, the former capable of containing in all 360 persons and the latter 70 persons. The walls have been raised 3½ feet, the seating has been remodelled and a platform pulpit erected. An important addition has been made to the general accommodation by the construction of an annexe on the Maberly Street side, the basement floor containing the heating apparatus, the ground floor a ladies' cloak-room, and the second storey the vestry, an airy and well-lighted apartment. The cost of the reconstruction scheme has been about 1,800*l.*

THE prettily-situated parish church of Logie, near Stirling, which has just been reconstructed at a cost of about 3,000*l.*, was reopened for public worship on Saturday afternoon. With the exception of the side walls, the church has been entirely rebuilt. Extensions have been made at both ends, the addition at the east end containing the chancel, and that at the west end a new vestibule, staircase and gallery, and ladies' cloakroom. A new pulpit has been put into the left of the chancel, and a small pipe-organ, driven by water-power, has been installed. The chancel is panelled in oak, and a number of very fine old carvings of Biblical subjects, the gift of the late Mr. Donald Graham, of Airthrey, have been introduced very successfully at intervals. Three beautiful stained-glass windows have been put in by generous friends of the church.

NEW business premises of a somewhat ambitious character have been erected in the Beastfair, Pontefract, and were opened on the 31st ult. as a high-class grocery store and café. The front has been carried out in Cuba mahogany, Aberdeen granite, St. Anne's marble and mosaic. The internal fittings and fixtures are all in best mahogany, Sicilian marble and faience tilework. The café on the first floor is fitted with the most up-to-date requirements in all respects, including gentlemen's and ladies' lavatories, billiard-room, smoke-room, &c. The mosaicwork has been supplied by Messrs. G. Woolliscroft & Co., Hanley; the shop is fitted up with a Waygood's lift; and the whole of the fireplaces and stoves on the first floor and in the billiard-room are carried out in Burmantofts ware. The café has been decorated in artistic colours with Messrs. Hall's washable distemper, and the lavatories with Messrs. Blundell S. Spence & Co.'s petrifying liquid. The café is well ventilated by Messrs. Crossley & Son, of Halifax, and the whole of the works have been carried out from the designs of the architect, Mr. Chas. Keyworth, Pontefract.

AN alarming accident occurred at Wellington on Sunday afternoon, in which four workmen from Walsall, who were engaged in placing an iron roof over furnaces at the Haybridge Ironworks, near Wellington, were seriously injured. Shortly before five o'clock the scaffolding on which the men were working collapsed, and the men fell with the ironwork and timber. Thomas Keabury, Chapel Street, Bicks, Walsall, in falling was caught in the scaffolding, and hung head downwards until rescued. He was badly injured, and one of his legs was fractured. Samuel Dexter, who also lives at Chapel

Street, Walsall, was cut about the head in a shocking manner. The other two men escaped with severe cuts and bruises. Keabury and Dexter were attended by Dr. Wedd, and then taken by road to Shrewsbury Infirmary, where Dr. Edleston made a further examination, and expressed the opinion that although they were severely injured they might recover. Had the furnaces been at work the men would probably have been killed.

ST. PAUL'S CHURCH, Craigydun, Llandudno, which has been erected as a memorial to the late Duke of Clarence, was consecrated on the 4th inst. by the Bishop of St. Asaph. The church, when completed, will provide sittings for 950 worshippers. The style is Early English. It consists of a fine nave, 94 feet long by 28 feet wide, with north and south arcades, and entrances towards the west and south; a very noble chancel, 37 feet long and 25 feet high, with an aisle or chapel on one side, and vestries and organ chamber on the other. The church is built of a beautiful local limestone, with dressings of Bromsgrove stone, the interior walls being faced with Bath stone ashlar. One feature of the interior is the use of the fine fossil marble from Frosterly, in Northumberland, for all the main columns. It is a deep grey on black marble, with larger fossils of a lighter shade scattered through it, and this colour contrasts with good effect with the varying tints of the stonework. The benches in the nave are of oak, and of handsome design.

SIR JOHN NEILSON CUTHBERTSON, chairman of the Glasgow School Board, opened on Friday evening an addition which has recently been made to the Keppochhill School Buildings, Glasgow, from designs by Mr. J. C. Menzies, architect. The extension is two storeys in height on the north wall frontage, and owing to a quick fall in the ground it reaches a height of three storeys on the frontages in Keppochhill Road and Bruce Street. The building, which is of white freestone, harmonises with the former building, and is designed to meet the present-day requirements of the Education Department. The basement floor is partly utilised as a drill hall, while there are playgrounds for girls and infants and a separate staircase for boys on the same floor. On the ground floor are five classrooms reserved for children, and a similar number for scholars in the higher standards are situated on the upper floor. The school throughout is heated on the low-pressure hot-water system, and each classroom is ventilated by independent shafts carried to the ventilators in

the roof. In general equipment the school is complete. The new portion provides for the accommodation of 242 infant and 360 older scholars.

An accident which might easily have had serious results occurred on the 10th inst. at Winchester, where preparations are being advanced for the King Alfred celebration next week. During the afternoon the colossal bronze statue of the king was being raised to its position on the granite base when one of the guide ropes broke. Luckily, the statue itself had only just begun to lift, and it settled down without injury. Two or three minutes later the two large scaffold poles, or shear legs, carrying the pulleys, came down with a crash, and falling on the hoarding were snapped off. Mr. Timothy Driscoll, of Chiswick, the contractor for the erection of the statue, was inside the hoarding, and was struck by some of the falling debris. At first he was thought to have been seriously hurt, but on examination at the hospital it was found he was only bruised. One of the broken poles rests on the upraised arm of the statue, but Mr. Thornycroft, the artist, who was present, hopes his work is unharmed.

THE parish church of Chevening, Kent, was opened last week after having been closed for the past few months for necessary alterations and repairs, which have been carefully carried out under the supervision of Mr. W. D. Caroe, architect to the Ecclesiastical Commissioners, at a cost of about 1,350*l*. On starting the work it was found that the floor and seats were full of dry-rot, and these were removed. The floor was then lowered about 6 inches, and instead of the old planks a new block-flooring was put down. An additional step was required for the chancel, and new seats were provided. The pulpit, organ and reading-desks were supplied with new bases, and the vestry was separated from the main building by a fine oak screen. An old ash screen, filled in at the top with glass, which at one time stood inside the west door, has been removed, and the font placed at the end of the main aisle instead of in the centre. A new staircase has been placed in the tower, and the old west doors have been done away with and replaced with one of oak. The interior of the walls has been cleaned, and the building presents a bright and cheerful appearance, and imparts a feeling of comfort and freshness.

THE new church erected for the Edzell (N.B.) United Free church congregation, from competitive plans drawn by Mr. P. H. Thoms, of Messrs. Thoms & Wyllie, Dundee, was opened on the 29th ult. It is built on a site at the corner of

FISHBURN'S LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

This Machine will be found invaluable in Warehouses, Factories, Maltshouses, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building. By a simple and expeditious arrangement it can be made to lift or lower at two or more points (or hatchways) to suit the floor spaces.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

CELTIC CROSSES

A SPECIALTY,

Studied from Ancient Crosses,
And every available example of Celtic Art.

The wonderful durability of IRISH LIMESTONE is well-known.

Dalhousie Street, a new street running westward, and the style is a modern version of late English Gothic. The church consists of nave and one aisle, with small transept for the choir, and provides sitting accommodation for 350. Besides, there is a hall seated for 100, with vestry, &c. Internally the church has a very bright and pleasing appearance. The windows, including a beautiful tracery window facing east, are all leaded, and the glass is of a light shade of amber. The ceiling of the church is ivory coloured, and the walls of light sage green. The stencilling in blue and red is bold, but withal has a harmonious effect. The pitch-pine pews are stained dark oak, and are admirably constructed. The features, however, undoubtedly are the pulpit and the pillars. The former is of oak and in keeping with the style of architecture. To the right of it, transferred from the old church, is the memorial tablet to the late Rev. Robert Inglis, the first minister of the Free church, to whose son, Colonel Inglis, the whole district owes so much. The pillars are of Brechin freestone, and have carved capitals, the artistic handiwork of Mr. James Bremner, Dundee. The passages are laid with cork carpet. The walls of the hall are painted in vermilion and the ceiling in ivory, while the cornices run in different shades. A bell has been placed in the tower.

THE synagogue erected in South Portland Street, Glasgow, for the Jews resident on the south side of the river, was consecrated on Sunday last. The building, which is of Moorish design, and has cost 9,000*l.*, has a frontage to South Portland Street of 81 feet, with a depth of 104 feet, excellent light being obtained on all sides. The façade is divided into a centre, which contains spacious doors under a wide arch, with decorated windows and pediment over the two projecting ends at the extreme corners. The floor level is 4 feet above the pavement, and the entrance into the synagogue is through a central hall. With the women's galleries, the synagogue has accommodation for about 1,000 worshippers, while on holidays the classrooms are so arranged that they can be utilised along with the main building, thus giving accommodation for over 1,600 people. The basement consists of a lower synagogue, where the study of the law can be conducted in perfect quietness, and ample provision is made for ladies' rooms and for social and other meetings, as well as the usual ritual bath accommodation. Altogether the new synagogue is the largest in Scotland. The plans were prepared by Mr. James Chalmers, I.A., Glasgow. The ceremony began with a meeting in the vestry adjoining the inner doorway of the

synagogue. Mr. E. Hyman, the president of the synagogue, here presented a massive gold key to Mr. J. Frankenburg, the convener of the building fund, with which he was invited to open the door prior to the entry of the clergymen and the procession. In making the presentation, he expressed the indebtedness of the congregation to Mr. Frankenburg for his efforts in connection with the new edifice.

TWO new Board schools were opened at Edinburgh on the 3rd inst., namely, the Flora Stevenson school, at Comely Bank, and the Parson's Green school, adjoining the King's Park, the former of which has accommodation for about 1,400 pupils and the latter about 1,450. The new schools are large and solid-looking buildings, with somewhat plain exteriors, and immediately on going inside one is struck with the spaciousness and airiness of the surroundings. These, along with the abundance of light, are indeed the special features of the new schools, and apart from them there is nothing noteworthy about the classrooms, except that everything is new and fresh, and that the fittings and furnishings are of the latest and most improved types. This cheerfulness and brightness is largely due to the presence of a large central hall, with two galleries, and it is from this hall and these galleries that entrance is obtained to the classrooms, admission to the upper flats being got from wide staircases at each end. The whole of the ground floor will be occupied by the infant department and the upper flats will be set apart for the seniors and juniors. In addition to the ordinary classrooms there is a combined workshop and cookery classroom, and a gymnasium on the top floor. The centre of the roof is covered with glass and a splendid light is thereby obtained. Matters are not yet quite in order at either of the schools, and in some instances yesterday the teachers were carrying on their work side by side with painters and other workmen, who were busily engaged putting the finishing touches upon their operations. Desks and other things have yet to be fitted up in some of the classrooms, and the fine large rooms set apart for the gymnasiums at both schools have not yet been equipped, and were quite empty yesterday. Both schools are lighted with electricity, ventilation is obtained from fans driven by electric motors, and the heating is done by hot-water pipes.

THE foundation-stone of a new English Presbyterian church at Wepre, Connah's Quay, was laid on Wednesday.

IMPORTANT NOTICE

To Shipowners, Shipbuilders, Contractors, House Builders and Painters, and others.

The Products specified below are unrivalled, and have only just been introduced into this country.

The "PERFECT" Universal Cleaner, for removal of Old Paint and Varnish from Wood, Iron, Steel, or Stone. Magical in action. Guaranteed not to injure material, and new Paint or Varnish may be at once applied.

PORPHYRINE.—A Liquid for Dressing Walls of New Houses, to prevent Damp, and so that Paint or Paper may be put on at once, and for Removing Damp in Old Houses. This is a really wonderful preparation.

FEROPHILE.—A Liquid for Removal of Rust.

"EXCELSIOR".—A Paste for Prevention of Rust.

ELECTRIC NOTES.

OPERATIONS have commenced for the erection of works in Commercial Road, Hawick, for the supply of electricity for both light and power. It is expected that the work will be so far advanced as to be partially in operation on November 1 next. The plan includes boiler-house, engine-room, store-room, concrete flat, &c., and the front elevation will face Commercial Road.

IN connection with the extensive electrical illuminations which are being prepared at Dunkirk and at Compiègne on the occasion of the visit of the Czar of Russia to France, effective devices on the E.L.B. system are being provided by the Paris representatives of Electric Lighting Boards, Limited, of 7 Pall Mall, on a very large scale. The new town hall, which is to be opened by President Loubet, and other public buildings at Dunkirk are being entirely illuminated on the E.L.B. system, and at Compiègne alone, where the Czar will reside for a few days, the approaches to the Castle are being illuminated by devices requiring no less than 7,000 lamps.

A SERIOUS explosion took place on Wednesday afternoon at Tunbridge Wells at the electric light works of the Borough Corporation. The explosion was caused by the bursting of a super-heater attached to a Lancashire boiler. Without any warning, the super-heater shot into the air, wrecking the roof of the engine-house. There were nearly twenty men about at the time. One of them named Young, of Willesden, was scalded about the face, arms and legs, and several were cut about the hands and body by glass and debris from the roof. The injured men were conveyed to hospital in the police ambulance, and after treatment all except Young were able to leave. The cause of the explosion is unknown.

THE annual report of the Burgh electrical engineer (Mr. A. J. Fuller), submitted at the meeting of Ayr Town Council, stated that the whole of the machinery had run perfectly satisfactorily throughout the year. Two and a half miles of extension cable had been laid, and 94 connections made during the year, the private consumers now numbering 450. As to public lighting, three additional arc lamps had been connected and 29 incandescent lamps, making a total of 85 arcs and 146 incandescent. During the year orders for extension of plant and mains had been placed amounting to 17,000/. The capital expenditure on the works now amounted to 56,158/. The revenue for the year from private lighting was 3,327/; from public lighting, 2,065/; from other sources, 198/—total 5,590/.

The total output from the works had risen from 425,639 units to 490,496 units, an increase of 15 per cent. For private lighting the average price was 4.7d. per unit, and for public lighting 1.5d. per unit. With these low figures, the engineer reported, they were able to provide a surplus profit of 1,432/. towards meeting the interest and sinking-fund charges, amounting to 2,560/, leaving a deficiency of 1,127/.

AT the monthly meeting of the Manchester City Council held on the 4th inst. at the Town Hall, Dr. Bishop, in moving the adoption of the electricity committee's report, stated the reasons which led to the acceptance of a foreign tender for switchboards instead of one of an English firm. He said that of the twenty firms who competed in response to the Council's advertisement the lowest tender was that of the Electrical Company of Berlin, which amounted to 39,306/, and which the committee had accepted. The next tender was that of the British Westinghouse Company, which amounted to 42,551/. The difference was only small, but had it been accepted the work would have been done in America. The third tender was that of Siemens Brothers, Ltd., for 50,004/, but in that case the work would have been done in Berlin. The lowest English tender was between 19,000/ and 20,000/ higher than the tender the committee had accepted. Only two were tenders in which, if the committee had accepted them, the work would have been done in this country. He maintained that it was quite impossible, under the circumstances, for the committee to have considered either of those two firms.

THE application of electrical traction to the tramways and light railways in Dudley and Kinver district was inaugurated on the 31st ult., when, on the invitation of the British Electric Traction Company, a large party, including representatives of local authorities interested, travelled over some of the lines between those places. At the latter Mr. J. S. Raworth (technical director) proposed the toast of "The Local Authorities," and urged the desirability for such a district of a comprehensive scheme of tramways in preference to a number of small systems owned by independent local authorities. Alderman Dunn, of Dudley, acknowledged the toast. Mr. Graham, of Wolverhampton, in proposing "Success to Electric Locomotion in South Staffordshire," said he was sorry Wolverhampton occupied an isolated position. He would not enter into the dispute between the Corporation and the Company, but suggested that it should be settled by arbitration. Mr. Garcke (managing director) responded. He stated that the

company had under its control some 60 or 70 miles of tramway in South Staffordshire and North Worcestershire, and hoped ultimately to have about 100 miles. By the time the electrification of this system had been completed the company would have spent a million and a half on the district. They had carried out negotiations with twenty-four different local authorities, and of these only three or four still remained to be converted—Wolverhampton, Tipton, Wednesbury and Birmingham. He believed they had practically arranged the matter with Tipton and Wednesbury, but Wolverhampton for the present preferred to remain in a state of isolation. He was willing to adopt the suggestion that the matter should be settled by representatives of the Corporation of Wolverhampton and of the company. Sir F. Godson, M.P., and Mr. E. Spencer, M.P., also spoke, and the visitors returned to Dudley by special trams.

BUILDING AND BUILDERS.

PLANS have been approved for a new infirmary for Chesterfield, which, it is estimated, will cost about 45,000*l*.

IT is proposed to apply for the sanction of the Board of Education to borrow 700*l*. to provide a site for a new infant school at Portobello.

FOUNDATION-STONES were laid at Morecambe on Saturday of the new Baptist church, which is to be erected in Victoria Street at a cost of 4,238*l*. 15*s*. The church will seat 720 persons.

A NEW church is to be built in the place of St. Paul's Congregational Church, Wigan. The parent building dates back to 1785, and is the parent Congregational church of the district.

IT has been decided after six years' consideration to expend a sum of about 6,000*l*. in the erection of municipal buildings at Musselburgh, N.B. In course of the final discussion Bailie Bisset referred to the existing offices of the burgh as kennels.

THE plans of the Infectious Diseases Hospital for Girvan, N.B., have now been approved by the Local Government Board, and an immediate start will be made with their erection. The water scheme is also in a forward condition.

AT the monthly meeting of the Avondale School Board it was unanimously agreed to build an elementary school in Strangsfeld to accommodate about 1,000 pupils at a probable cost of 11,000*l*. Mr. Cullen, architect, was instructed to prepare plans for the Department as soon as possible.

THE Methodist New Connexion Church has decided to erect a school-chapel at Cudworth, Yorks. Plans have been prepared by Mr. P. A. Hinchliffe, Barnsley, and corner-stones have been laid.

MR. PERCY H. CURREY, architect, Derby, has in hand plans for the erection of a church for the newly-created parish of Dethick, Lea and Holloway, for which a good site has been secured about the centre of the parish, and funds to the amount of 2,500*l*. have been raised towards the 4,500*l*. needed for a church to seat 300 people.

THE Colne (Lancs) Town Council have adopted the Baths and Washhouses Acts, and appointed a committee to prepare a scheme. This action on the part of the Town Council is the outcome of an application, which was refused, from the Colne School Board to the Corporation for the supply of water to baths the Board proposed to erect.

MR. ALFRED HEAVER, of Oak Lodge, Upper Tooting, and of Holcombe Cottage, Westcott, near Dorking, builder, who died on August 8 last, aged 60 years, has left property which has been valued at 389,883*l*. 19*s*. 9*d*. gross, including personality of the net value of 235,250*l*. 6*s*. 6*d*. He bequeathed to his manager, Mr. Edward Coates, if and when he should be unable to continue his employment through illness or old age, an annuity of 4*l*. 4*s*. a week for the remainder of his life.

THE memorial-stones of a new church and school which are in course of erection in Beverley Road, Bolton, were laid on the 31st ult. The buildings comprise a complete scheme of church and Sunday school premises, as it has been thought best to enter upon the work thoroughly equipped for all its branches, rather than follow a frequent custom of hampering the work by squeezing it all into a small building ultimately intended for only one section. The church will occupy the angle formed by Beverley Road and Wyresdale Road, and will thus be seen from Chorley New Road, of which it will become a prominent and, it is believed, a pleasing feature. The site has been a difficult one to deal with, but the plan arrived at will, it is expected, give both an effective interior and exterior. There will be end and side galleries, and an ample gallery also for organ and choir. The accommodation will be for about 400. The main entrance will face Chorley Road, but there will also be entrances from Beverley Road and Wyresdale Road. The school will be at the back of the church, and will be of two storeys, each schoolroom measuring 50 feet by 30 feet, and there are to be seven classrooms of various sizes, easily acces-

LIST No. 4.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889.)

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.

sible. Separate entrances and staircases for boys and girls will give access to the upper rooms. The exterior is to be faced with local pressed bricks and terra-cotta dressings, and the style is a free Renaissance. The builders are Messrs. Atherton & Morris, and the architects Messrs. Potts, Son & Hemmings.

THE Local Government Board have forwarded their sanction to the application of the Cheltenham Town Council for power to raise a loan of 35,000*l.* for the erection of a town hall and assembly rooms upon a portion of the Winter Garden site on the north side of the glass structure. The necessity for the provision now about to be made arose from the acquisition of the famous old Assembly Rooms in High Street (opened by the Duke of Wellington) by Lloyds Banking Company, who are now erecting upon the site of the demolished building handsome bank premises. Considerable opposition was raised to the Corporation scheme by the residents in Imperial Square. It was admitted that the provision of similar accommodation to that which the old assembly rooms had for so long supplied was an imperative necessity in a town of the social amenities which have characterised Cheltenham, but the opponents of the scheme objected to the particular site chosen on the ground that it would considerably diminish the area of a desirable open space in the centre of the town, and they suggested as an alternative that the Corporation should either adapt the present Winter Garden building to meet all requirements—which was, the other side contended, a matter of impossibility—or they should acquire the premises which Lloyds Bank will relinquish when the new bank is ready, and put the new building opposite the site of the old rooms, and at the same time widen Winchcombe Street. This latter scheme, however, would have involved an outlay of something like 100,000*l.*, and it was not really put forward with seriousness. The Local Government Board have, it would now seem, come to the conclusion that the Corporation scheme is a wise and good one, and the best under the circumstances. They have consequently not listened to the objections of the opponents, beyond inquiring into the effect of certain legal covenants attached to the Winter Garden property, and having satisfied themselves thereon, their reply has been received by the Town Clerk, giving sanction to the loan mentioned. The Council now have under consideration a proposal for buying up the old (Lloyds) bank premises for 8,000*l.*, and converting them into municipal offices.

At a sitting of the Consistory Court, held on Saturday at Norwich Cathedral, before the chancellor (Mr. T. C. Blofeld),

Mr. Hales prayed an Act of Court with respect to the restoration of Wymondham Church. He said he appeared on behalf of the vicar (the Rev. and Hon. A. Parker) and the churchwardens (Messrs. E. B. Pomeroy, J. S. Parker, E. W. Routh Clarke and W. B. Fryer), and alleged that the parish church required alteration. The proposed repairs were:—(1) To repair the roof of the church with the best English oak and lead where necessary, including the roofs of the nave and aisles; (2) repair the walls and windows and reglaze the latter where necessary; (3) remove certain tablets from the pillars of the nave to the north and south aisles; (4) remove the organ gallery and apparatus behind it now standing at the west end of the church, build a new west gallery and complete in the best English oak a fan-vaulted ceiling to the tower; (5) take up the floor of the church and remove soil so as to restore it to its old level, fill up the vaults, concrete over same and relay the floor with York stone paving, the memorial slabs to be kept in the same position as at present and not concealed from view; (6) to furnish the church, the choir and the sanctuary with oak fittings to walls and screens; (7) erect a stone reredos at the east end, and decorate according to plans to be hereafter submitted; (8) erect vestries at the east end; (9) supply lighting and heating apparatus; (10) fit up the eastern part of the north aisle for daily service, and erect a screen there; (11) rebuild the organ and fit the same in a new west gallery; (12) repair the abbey or eastern tower; (13) repair the western tower and complete it with its parapets and pinnacles; (14) recast and rehang the bells, and do other works to the church. Mr. Hales said with reference to the memorial tablets to be removed from the nave, he did not yet know which one would be removed, but he would produce an affidavit explaining later on. The tablets interfered to an extent with the moulding. The parapets and pinnacles of the western tower had never yet been completed, and it was proposed to finish this work. The total cost of the work would be an amount not exceeding 25,000*l.*, half of which had already been promised, and the remaining half would be provided by voluntary subscription. The work would not be carried out until the money was provided, but as some of it had already been subscribed the work had been commenced. The vicar produced plans and specifications of the repairs and alterations prepared by the architect, Mr. W. S. Hicks, of Newcastle. He said that one of the bells was badly cracked and had a piece sawn out, and another was out of tune. Citation was ordered to be issued.

NEW BATHS FOR RUSHOLME.

COLONEL W. LANGTON COKE held an inquiry at the Manchester Town Hall respecting the application of the Corporation for sanction to borrow 40,000 $\frac{1}{2}$ to be used in the erection of public baths in High Street, Chorlton-on-Medlock, to be known as the Victoria Baths. The case for the Corporation was opened by Mr. Hudson, the deputy town clerk. He said the area of the city was 12,709 acres, the population in 1901 543,969, and the rateable value 3,359,298 $\frac{1}{2}$, a penny rate producing 12,892 $\frac{1}{2}$. The wards of the city which the proposed baths were intended to serve were St. Luke's, Rusholme, and Longsight, which together had an acreage of 2,003 acres, a population which in 1891 was 62,722, and the rateable value was 331,886 $\frac{1}{2}$. These baths had been thought of for many years, but on May 1 of this year the City Council agreed to the present scheme. The city already possessed nine public baths, of which eight were in the east or north-east portions and one in the south-west, but there was none in the southern portion of the city. The site measured 7,406 square yards, and had been acquired for 750 $\frac{1}{2}$, plus ground-rents of 89 $\frac{1}{2}$ and 44 $\frac{1}{2}$, which were perpetual and which the city would have to pay. The nearest existing baths were from thirty to forty minutes' walk from the proposed site. It was intended in the new buildings to make three plunge-baths. These would be 75 feet long, and one of them would be reserved for women. The width of this bath would be 30 feet, whilst the first and second-class plunge baths for men would be 40 feet and 35 feet wide respectively. The baths would be in three storeys. In addition to the three plunge baths there would be storage-rooms, rooms for swimming clubs, a set of rooms equipped for Turkish baths, and one room for Russian vapour baths. Slipper or wash baths would be provided for

forty-one men and twenty-three women. With regard to the Turkish baths it was intended to make such a charge as would make that part of the outlay self-supporting. The Corporation suggested that the loan of 40,000 $\frac{1}{2}$ which was asked for should be repayable in forty years.

Mr. Rothwell, deputy-chairman of the baths committee, in supporting the application, said the committee were practically unanimous in recommending the plans submitted, to which they had given an unusually large amount of time and attention. In addition to the general public there were twenty-three public schools in the vicinity of the site, and in accordance with the settled policy of the baths committee those schools would be encouraged to send scholars to the baths.

Mr. J. H. Boardman, solicitor, said he appeared to oppose the application on behalf of the Manchester and Salford Property Owners' Association. That body did not oppose baths as such, but they took exception to the elaborate character of the present scheme and to its excessive cost.

Mr. Henry Marsden, one of the councillors for the St. Luke's ward, supported the application. He said that there were hundreds of houses around which were without baths.

Mr. Joseph Derbyshire, the general superintendent of the Manchester Corporation baths, stated that the existing baths were often overcrowded. In 1900 295,446 school children attended them, and of these 139,311 were admitted free. Out of 157 schools, eighty-three had an official connection with one bath or another.

Mr. T. de Courcy Meade, city surveyor, put in the plans and elevation of the proposed buildings, which he described in detail.

The inquiry then closed.

A MEETING of Whitchurch (Cheshire) parishioners took place at the vestry last week to consider the question of further improvements to the church. The chair was taken by the rector, and there was a good attendance. The Rev. C. R. Pembbridge (secretary) reported at some length on the work done and recommended by the committee, showing that the two sides of the church had been covered with stone according to contract, and stating that it was now suggested to treat the west end similarly, also to carry out renovations and improvements in the apse, chancel, vestry, &c. It was decided that the architect should be asked to make an inspection and report as to what was most desirable.

The "ONE" Range.

PATENT 1331/01.

M. F. Co. Ltd. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;
CLARK, HUNT & CO., Shoreditch;
O'BRIEN, THOMAS & CO., Upper Thames Street;
R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;
ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—
THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool, and a third oven can be arranged if required.

ELECTRIC LIGHTING IN LEEDS.

THE Leeds Corporation are making extensive preparations for dealing with the increasing demand for electric light and power.

When the new buildings now in progress adjoining the existing generating station in Whitehall Road are completed, the works will cover an area of a couple of acres, and there will be accommodation for engines aggregating 29,700 indicated horse-power, or more than eight times the capacity of the plant when the works were taken over from the House-to-House Electricity Company in December 1898. The plant already installed and on order is equal to an output of 8,740 kilowatts, which will provide for more than double the present demand.

It is expected, says the *Leeds Mercury*, that a large proportion of the increased output will be utilised as motive power. Hitherto the use of electric motors in Leeds has been very limited, due to an impression that prevailed up to recently that the single-phase alternating current was unsuitable for motive purposes.

There have lately been great improvements in alternating motors, and it is now found possible to use this form of current for most purposes. In Leeds single-phase motors can already be seen doing a great variety of work, among which may be mentioned wood turning, cloth finishing, coffee grinding, type setting, printing, copper depositing, lathe driving, coppering, corn milling, driving sewing machines, &c. The large new bakery of the Leeds Industrial Co-operative Society is operated entirely by electrical power, and the printing offices of the *Leeds Mercury* are being fitted with electric motors throughout. The demand for current as motive power has indeed trebled within the last eighteen months.

With a view to meeting the comparatively few cases in which single-phase motors are not the most desirable, the Corporation decided some time ago to provide plant on the "two-phase" system, by which a form of current is supplied that is suitable for all motive purposes. Three engines and alternators (each of 1,000 horse-power) are being erected at the Corporation works, and two-phase current is now available in Whitehall Road, Globe Road, Water Lane, Marshall Street, Manor Road, Victoria Road and other streets in that vicinity.

The great advantage to an electric-supply undertaking of a demand for motive power lies in the fact that such a demand continues for much longer periods than the hours of artificial lighting, and that it keeps the generating plant employed at times when it would otherwise be idle. It is thus possible to

supply current for such purposes at low prices, and the more constantly the motors are used the lower the price that can be accepted. In Leeds the price ranges from 1½d. to 2d. per unit, the lowest price being charged to the customers who use power sixty hours per week and upwards. The maximum of 2d. per unit is only in force in cases where the use is less than twenty hours per week.

The price of current for lighting purposes is also being reduced. At the end of the present month it will be reduced from 5d. per unit to 4d. per unit, the somewhat perplexing scale of discounts hitherto in force being substituted by this uniform method of charge. There is a discount of 5 per cent. for prompt payment, and the charges for connecting, meter rents and other imposts have from time to time been abolished.

As a result of this policy and the extensions of mains in industrial and outlying districts, the use of electric light is spreading rapidly. The Leeds School Board are installing electric light in some of their new schools, and large installations are also being made at the Kirkgate markets, the railway goods yards and other important establishments, whilst the reconstructions of property in the centre of the city have resulted in a large accession of business to the electric-lighting department, which has doubled its output in the last two and a half years.

THE AUCHENCORTH TUNNEL.

A REPORT has been prepared by Mr. Hill, consulting engineer, Manchester, on the tunnel works in connection with the new supply of water from Talla to Edinburgh, and in particular the Auchencorth tunnel, which has shown signs of defects. Mr. Hill has presented an interim report dealing specially with the condition of the damaged tunnel, and reserves his full report until he has had time to examine all the other tunnels in connection with the scheme. As regards the Auchencorth tunnel, Mr. Hill points out that where the failure in the concrete lining has occurred he had advised Mr. Tait, the engineer to the Water Trust, that the work should be opened out from the surface and that the present lining should be replaced with brickwork of 18 inches, with curved and radiated sides and invert. The invert might be formed of three rings of brickwork. This work could be proceeded with at once. The length to be placed is about 100 yards. Mr. Hill is further of opinion that where the tunnels pass through clay and heavy ground the invert should be put in at the same time as the sides

and arches, and immediately following the driving of the tunnel. It was the most important part of the structure, and ought not to be left out even temporarily. The tunnel at Auchencorth appeared to be the only one which had given way, and he should like to point out that in spite of the work having been suspended for about two years, with the invert omitted and water lying on the bottom and softening the foundations of the side walls, the failure had only just occurred. He observes that the work should not have been subjected to such severe conditions, which were, of course, not contemplated by the design, and adds that the work in the neighbourhood of the Auchencorth tunnel appeared to be satisfactory so far as it had been completed. He strongly recommends that the invert in all cases should be put in without delay, and, of course, where specially bad ground was met with the strength of the work must be increased. The committee directed the engineer to proceed at once to carry out Mr. Hill's recommendation. With reference to probable cost of making good the defects in the Auchencorth tunnel, Mr. Tait reported that having consulted the contractor he was of opinion that a sum of about 4,000*l.* would be required. The work of reconstructing the damaged portion is to be done open cast, which involves a cutting of from 45 feet to 50 feet.

BIRMINGHAM WATERWORKS.

At the Engineering Congress in Glasgow Mr. Mansergh read a paper, in which he said the city of Birmingham, with the district around it which the Corporation supplied with water, was an area of 130 square miles. The present sources of supply were six wells in the red sandstone and four or five small springs. The largest of the reservoirs held over a million gallons. At present the demand was for 19 million gallons a day, but during the last dry season they had to supply 24 million gallons a day. They were, however, in terrible straits, and did not go a year too soon to Parliament for powers to construct works. It was curious that thirty years ago, when he was engineer on the railway passing through the district, he spotted the area from which he was now drawing the water and put it on paper. When in 1890 the Corporation of Birmingham asked him to advise them, it was therefore a very small thing to prepare a scheme. The source of the supply was the river Elan, a tributary of the Wye. The Elan formed the boundary between Breconshire and Radnorshire. From the lowest

reservoir to the centre of Birmingham was just about 80 miles; while to the reservoir outside Birmingham the distance was 74 miles, which was pretty equally divided between tunnel and cut and cover on the one hand and iron and steel pipes crossing valleys on the other. The mean rainfall at the watershed was about 55 inches, and they expected to get 27 million gallons a day, besides giving off a similar quantity as compensation water. The dam, which was being constructed in a narrow gorge at the lowest level of the watershed, would impound over 4,000 million gallons, and there would be provided a supply which would last 180 days. In the course of his remarks Mr. Mansergh stated that at one place, when the dam was completed, an old church would be covered by about 100 feet of water, while in the same district a house which Shelley at one time lived in would also be submerged. They had, of course, a large staff of workmen employed on the works, and they had erected a village with an infectious diseases hospital. New arrivals were lodged in a doss-house for a week, where they were practically in quarantine. By this means they had entirely prevented the outbreak of any infectious diseases. Limelight views were used by Mr. Mansergh to illustrate his description of the works and the natural difficulties which had to be overcome.

Mr. T. Harpur said it had been his privilege to visit these works once a year, and it was his opinion that the doss-house was one of the finest ideas, from a sanitary point of view, that could be conceived; and it had resulted, as they had heard, in entirely preventing disease. The village was also a model one.

In replying, Mr. Mansergh said they had no parliamentary powers to imprison the men in the doss-house, but he thought they all enjoyed it. As they knew, navvies tramped all over the country, and they had men coming and working for them for four or five months and then going elsewhere. Then they came back to the valley, which was about the only place where they got a good clean. All the work was being done without a contractor under the Corporation administration. After he got his committee to agree to that, he told them that they must provide for the housing of the workmen. After disgusting his committee with a description of the usual methods of housing navvies, somewhat emphasised, he got them to agree to provide decent premises. Each of the navvies had a cubicle to himself, and the cubicles were in groups of eight. The result was that they kept constantly on the job a nucleus of good, steady men on whom they could rely. They had huts of five different types for the different ranks of workmen.

METROPOLITAN ASYLUMS BOARD.

At the meeting of the Metropolitan Asylums Board on the 7th inst. a letter was read from the Local Government Board stating that, with much hesitation, owing to the large cost involved, but relying on no moneys being expended on any unnecessary work, and on the estimated expenditure (284,312*l.*) not being exceeded, they were prepared to approve the plans of the Southern Hospital, and asking for copies of the plans. Mr. E. White, replying to Sir E. Galsworthy and Mr. W. Crooks, said that the reason the buildings were so costly was that the Local Government Board themselves had insisted that the unit of accommodation in the cottages which were to form the hospital should be smaller than it had hitherto been. The accommodation would be only twelve persons per cottage, although the managers had asked that it should be increased to fifteen, and that had necessitated the construction of a larger number of cottages. The original estimated cost had been reduced as much as possible, having regard to efficiency. The managers accepted the tender of Messrs. J. Parsons & Sons, 118 Church Road, Hove, for the erection, at the sum of 17,228*l.*, of four seaside homes for children at Rustington, near Littlehampton, in accordance with the plans and specification prepared by Mr. Rowland Plumbe, architect, and the seal of the Board was affixed to the contract.

ELECTROLYSIS OF GAS PIPES.

A PAPER was read by Dr. Leybold, Hamburg, on "Electrolysis of Gas Pipes, &c.," at the Engineers' Congress in Glasgow. He said that the durability of gas pipes varied from twenty-five to fifty years. In a few cases, from particular causes, quicker destruction took place. In recent years a new and previously unthought-of enemy of our gas pipes had showed itself, viz. electrolysis. It was known that by the electric current, in the presence of saline solutions of different kinds, metals could easily be dissolved. In Hamburg the pipes were protected with canvas and boiled tar. On examination it was found that in some places the tar as well as the canvas had fallen off and the pipes were eaten through in parts to the size of a centimetre. In removing the covering it was found that the corrosion existed in every stage from the beginning until

complete penetration. Apparently the wrapping with boiled tar and canvas favoured destruction, for in the blisters which were found under the tar it quietly went on, while with a direct bedding of the pipes in the earth without any covering the earth would have absorbed the fluid. These pipes were taken up and replaced by others all covered, but after the expiration of seven or eight months the pipes were found to be again destroyed, penetrated with holes. Every endeavour must be made to reduce the currents passing into the pipes; and when laying down electric tramways great care must be taken to prevent the current flowing into the earth. This could be done in one way by the laying of well-conducted rails, the rails having sufficient transverse section and the points of contact well joined together by soldered copper wire. A further method was by fixing insulated return transmission cables in many places in order to direct the current back from the rails to the electricity works.

THE BRITISH ASSOCIATION.

ON Wednesday the meeting of the British Association at Glasgow was commenced. The president, Professor A. W. Rücker delivered an address, in the course of which he said this meeting of the British Association is not only remarkable as being the first in a new reign. It is also the first in a new century. It is held in Glasgow at a time when your International Exhibition has in a special sense attracted the attention of the world to your city, and when the recent celebration of the ninth jubilee of your University has shown how deeply the prosperity of the present is rooted in the past. What wonder, then, if I take the chair to which you have called me with some misgivings? Born and bred in the South, I am to preside over a meeting held in the largest city of Scotland. As your chosen mouthpiece I am to speak to you of science when we stand at the parting of the centuries, and when the achievements of the past and present, and the promise of the future, demand an interpreter with gifts of knowledge and divination to which I cannot pretend. Lastly, I am President of the British Association as a disciple in the home of the master, as a physicist in a city which a physicist has made for ever famous. Whatever the future may have in store for Glasgow, whether your enterprise is still to add wharf to wharf, factory to factory, and street to street, or whether some unforeseen "tide in the affairs

of men" is to sweep energy and success elsewhere, fifty-three years in the history of your city will never be forgotten while civilisation lasts.

More than half a century ago a mere lad was the first to compel the British Association to listen to the teaching of Joule, and to accept the law of the conservation of energy. Now, alike in the most difficult mathematics and in the conception of the most ingenious apparatus, in the daring of his speculations and in the soundness of his engineering, William Thomson, Lord Kelvin, is regarded as a leader by the science and industry of the whole world.

It is the less necessary to dwell at length upon all that he has done, for Lord Kelvin has not been without honour in his own country. Many of us who meet here to-night met last in Glasgow when the University and city had invited representatives of all nations to celebrate the jubilee of his professorship. For those two or three days learning was surrounded with a pomp seldom to be seen outside a palace. The strange Middle Age costumes of all the chief universities of the world were jostling here, the outward signs that those who were themselves distinguished in the study of nature had gathered to do honour to one of the most distinguished of them all.

Lord Kelvin's achievements were then described in addresses in every tongue, and therefore I will only remind you that we assembled here to-night owe him a heavy debt of gratitude; for the fact that the British Association enters on the twentieth century conscious of a work to do and of the vigour to do it is largely due to his constant presence at its meetings and to the support he has so ungrudgingly given. We have learned to know not only the work of our great leader, but the man himself, and I count myself happy because in his life-long home, under the walls of the university he served so well, and at a meeting of the Association which his genius has so often illuminated, I am allowed, as your President, to assure him in your name of the admiration, respect, nay, of the affection, in which we all hold him.

I have already mentioned a number of circumstances which make our meeting this year noteworthy. To these I must add that for the first time we have a section for education, and the importance of this new departure, due largely to the energy of Professor Armstrong, is emphasised by the fact that the chair of that section will be occupied by the vice-president of the Committee of Council on Education, Sir John Gorst. I will not attempt to forecast the proceedings of the new section. Education is passing through a transitional stage. The recent

debates in Parliament, the great gifts of Mr. Carnegie, the discussion as to University organisation in the North of England, the reconstitution of the University of London, the increasing importance attached to the application of knowledge both to the investigation of nature and to the purposes of industry, are all evidence of the growing conviction that without advance in education we cannot retain our position among the nations of the world. If the British Association can provide a platform on which these matters may be discussed in a scientific but practical spirit, free from the misrepresentations of the hustings and the exaggerations of the partisan, it will contribute in no slight measure to the national welfare.

But amid the old and new activities of our meeting the undertone of sadness, which is never absent from such gatherings, will be painfully apparent to many of us at Glasgow. The life-work of Professor Tait has ended amid the gloom of the war cloud. A bullet, fired thousands of miles away, struck him to the heart, so that in their deaths the father and the brave son, whom he loved so well, were not long divided. Within the last year, too, America has lost Rowland Viriamu Jones, who did yeoman's service for education and for science, has succumbed to a long and painful illness, and one who last year at Bradford seconded the proposal that I should be your president at Glasgow, and who would unquestionably have occupied this chair before long had he been spared to do so, has unexpectedly been called away. A few months ago we had no reason to doubt that George Francis FitzGerald had many years of health and work before him. He had gained in a remarkable way not only the admiration of the scientific world, but the affection of his friends, and we shall miss sadly one whom we all cared for, and who, we hoped, might yet add largely to the achievements which had made him famous.

The Science of the Nineteenth Century.

Turning from these sad thoughts to the retrospect of the century which has so lately ended, I have found it to be impossible to free myself from the influence of the moment and to avoid, even if it were desirable to avoid, the inclination to look backward from the standpoint of to-day.

Two years ago Sir Michael Foster dealt with the work of the century as a whole. Last year Sir William Turner discussed in greater detail the growth of a single branch of science. A third and humbler task remains, viz. to fix our attention on some of the hypotheses and assumptions on which the fabric of

modern theoretical science has been built, and to inquire whether the foundations have been so "well and truly" laid that they may be trusted to sustain the mighty superstructure which is being raised upon them.

The moment is opportune. The three chief conceptions which for many years have dominated physical as distinct from biological science have been the theories of the existence of atoms, of the mechanical nature of heat and of the existence of the ether.

Dalton's atomic theory was first given to the world by a Glasgow professor—Thomas Thomson—in the year 1807, Dalton having communicated it to him in 1804. Rumford's and Davy's experiments on the nature of heat were published in 1798 and 1799 respectively; and the celebrated Bakerian lecture, in which Thomas Young established the undulatory theory by explaining the interference of light, appeared in the "Philosophical Transactions" in 1801. The keynotes of the physical science of the nineteenth century were thus struck, as the century began, by four of our fellow countrymen, one of whom—Sir Benjamin Thompson, Count Rumford—preferred exile from the land of his birth to the loss of his birthright as a British citizen.

Doubts as to Scientific Theories.

It is well known that of late doubts have arisen as to whether the atomic theory, with which the mechanical theory of heat is closely bound up, and the theory of the existence of an ether have not served their purpose, and whether the time has not come to reconsider them.

The facts that Professor Poincaré, addressing a congress of physicists in Paris, and Professor Poynting, addressing the Physical Section of the Association, have recently discussed the true meaning of our scientific methods of interpretation; that Dr. James Ward has lately delivered an attack of great power on many positions which eminent scientific men have occupied, and that the approaching end of the nineteenth century led Professor Hæckel to define in a more popular manner his own very definite views as to the solution of the "Riddle of the Universe," are perhaps a sufficient justification of an attempt to lay before you the difficulties which surround some of these questions.

To keep the discussion within reasonable limits I shall illustrate the principles under review by means of the atomic theory, with comparatively little reference to the ether, and we may also at first confine our attention to inanimate objects.

The Construction of a Model of Nature.

A natural philosopher, to use the old phrase, even if only possessed of the most superficial knowledge, would attempt to bring some order into the results of his observation of nature by grouping together statements with regard to phenomena which are obviously related. The aim of modern science goes far beyond this. It not only shows that many phenomena are related which at first sight have little or nothing in common, but in so doing also attempts to explain the relationship.

Without spending time on a discussion of the meaning of the word "explanation," it is sufficient to say that our efforts to establish relationships between phenomena often take the form of attempting to prove that, if a limited number of assumptions are granted as to the constitution of matter or as to the existence of quasi-material entities, such as caloric, electricity and the ether, a wide range of observed facts falls into order as a necessary consequence of the assumptions. The question at issue is whether the hypotheses which are at the base of the scientific theories now most generally accepted are to be regarded as accurate descriptions of the constitution of the universe around us, or merely as convenient fictions.

Convenient fictions be it observed, for even if they are fictions they are not useless. From the practical point of view it is a matter of secondary importance whether our theories and assumptions are correct, if only they guide us to results which are in accord with facts. The whole fabric of scientific theory may be regarded merely as a gigantic "aid to memory," as a means for producing apparent order out of disorder by codifying the observed facts and laws in accordance with an artificial system, and thus arranging our knowledge under a comparatively small number of heads. The simplification introduced by a scheme which, however imperfect it may be, enables us to argue from a few first principles, makes theories of practical use. By means of them we can foresee the results of combinations of causes which would otherwise elude us. We can predict future events, and can even attempt to argue back from the present to the unknown past.

But it is possible that these advantages might be attained by means of axioms, assumptions and theories based on very false ideas. A person who thought that a river was really a streak of blue paint might learn as much about its direction from a map as one who knew it as it is. It is thus conceivable that we might be able, not indeed to construct, but to imagine, something more than a mere map or diagram, something which

might even be called a working model of inanimate objects, which was nevertheless very unlike the realities of nature. Of course, the agreement between the action of the model and the behaviour of the things it was designed to represent would probably be imperfect, unless the one were a facsimile of the other, but it is conceivable that the correlation of natural phenomena could be imitated, with a large measure of success, by means of an imaginary machine, which shared with a map or diagram the characteristic that it was in many ways unlike the things it represented, but might be compared to a model in that the behaviour of the things represented could be predicted from that of the corresponding parts of the machine.

We might even go a step further. If the laws of the working of the model could be expressed by abstractions, as, for example, by mathematical formulæ, then, when the formulæ were obtained, the model might be discarded, as probably unlike that which it was made to imitate, as a mere aid in the construction of equations, to be thrown aside when the perfect structure of mathematical symbols was erected.

If this course were adopted we should have given up the attempt to know more of the nature of the objects which surround us than can be gained by direct observation, but might nevertheless have learned how these objects would behave under given circumstances.

We should have abandoned the hope of a physical explanation of the properties of inanimate nature, but should have secured a mathematical description of her operations.

There is no doubt that this is the easiest path to follow. Criticism is avoided if we admit from the first that we cannot go below the surface, cannot know anything about the constitution of material bodies, but must be content with formulating a description of their behaviour by means of laws of nature expressed by equations.

But if this is to be the end of the study of nature, it is evident that the construction of the model is not an essential part of the process. The model is used merely as an aid to thinking, and if the relations of phenomena can be investigated without it so much the better. The highest form of theory—it may be said—the widest kind of generalisation is that which has given up the attempt to form clear mental pictures of the constitution of matter, which expresses the facts and the laws by language and symbols which lead to results that are true, whatever be our view as to the real nature of the objects with which we deal. From this point of view the atomic theory becomes not so much false as unnecessary; it may be regarded

as an attempt to give an unnatural precision to ideas which are and must be vague.

Thus, when Rumford found that the mere friction of metals produced heat in unlimited quantity, and argued that heat was therefore a mode of motion, he formed a clear mental picture of what he believed to be occurring. But his experiments may be quoted as proving only that energy can be supplied to a body in indefinite quantity, and when supplied by doing work against friction it appears in the form of heat.

By using this phraseology we exchange a vivid conception of moving atoms for a colourless statement as to heat energy of the real nature of which we do not attempt to define; and methods which thus evade the problem of the nature of the things which the symbols in our equations represent have been prosecuted with striking success, at all events within the range of a limited class of phenomena. A great school of chemists, building upon the thermodynamics of Willard Gibbs and the intuition of Van t'Hoff, have shown with wonderful skill that, if a sufficient number of the data of experiment are assumed, it is possible, by the aid of thermodynamics, to trace the form of the relations between many physical and chemical phenomena without the help of the atomic theory.

But this method deals only with matter as our coarse senses know it. It does not pretend to penetrate beneath the surface.

It is, therefore, with the greatest respect for its authors, and with a full recognition of the enormous power of the weapons employed, that I venture to assert that the exposition of such a system of tactics cannot be regarded as the last word of science in the struggle for the truth.

THE STREETS OF SYDNEY.

THE mayor of Sydney, Sir James Graham, lately commissioned Mr. W. H. Warren, Challis Professor of Engineering at the University of Sydney, to "report on the construction and maintenance of the streets of Sydney." The report has been prepared. The Mayor's instructions were that the following subjects were to be considered:—(1) In what respects the streets of Sydney differ from the streets of the best cities in Europe and America; (2) the present condition of the Sydney streets; (3) the methods of construction adopted and the materials used in the Sydney streets; (4) the best methods of

THE CORBIN LIQUID DOOR CHECK & SPRING

(The Latest and Best from America).

It Prevents Banging, but Latches the Door

Right Hand.

IS REPLACING OTHER CHECKS EVERYWHERE and is being Specified by Architects for Board Schools, Public Buildings & Private Houses.

BECAUSE

It is quicker and more positive in action, reducing draught to a minimum.
It never allows the door to bang.
Main Working Parts are Dust-Proof, and They never require Oiling or even cleaning.
Perfect regulation of Speed.
Absolute regularity of action.
The Liquid forming the check to the Spring is composed of ingredients not affected by extremes of temperature.
Superior design, construction and appearance.
Patented everywhere.
Will work for years without attention.
Simple provision for taking up wear of joints after long use, again making the check as good as new.

Also Holders for Spring Doors & other Specialties.

constructing and maintaining the streets of Sydney; and (5) the efficiency of the department entrusted with the construction and maintenance of the streets. The report dealt with the matters in this order:—(1) Macadamised pavements; (2) wood block pavements; (3) asphalt pavements; (4) brick pavements; (5) stone-set pavements; (6) pavements of various materials; and (7) the efficiency of the staff entrusted with the construction and maintenance of the streets.

(1) The macadamised roads of the city of Sydney, taken as a whole, have not been constructed and maintained in a satisfactory manner, and they do not compare favourably with those of the principal cities of Great Britain, Europe and America subject to similar traffic conditions. (2) The primary cause of the unsatisfactory state of the streets of Sydney is due to the neglect in supplying them regularly with sufficient road metal of suitable quality for their efficient maintenance. (3) The diminution in the quantity of road metal supplied each year from 1892 to 1899 accounts most fully and completely for the gradual deterioration of the streets during the periods referred to. (4) The responsibility of the policy of starving the streets during the periods referred to rests absolutely with the City Council. No portion of the responsibility can be attached to the city surveyor, as in his letters and reports to the Council he clearly pointed out the effect of the policy adopted, and urged the City Council to vote the necessary supplies of road metal to enable him to maintain the streets in a proper manner. (5) The necessity of supplying the streets with a sufficient quantity of road metal for their efficient maintenance is now fully admitted by the City Council, and the supplies voted recently greatly exceed those during the last ten years. (6) Considerable improvements must be made in the methods of construction and maintenance, in order to bring the streets up to the standard of the principal cities in Great Britain, Europe and America. (7) In regard to foundations, although the streets have been allowed to deteriorate, in consequence of the policy referred to, and in many cases the traffic has worn more or less into the sandstone foundations, I do not consider it wise to reconstruct the foundations in all cases. The large, wide sandstone pitchers, such as those now being used in the Darlinghurst Road, are too costly, besides being inferior as a foundation to narrower pitchers, similar to those adopted in the Telford roads, or a bed of sandstone broken to a gauge of 4 inches laid 8 inches deep may be advantageously used. The old road surface, if properly cleansed and scarified, in some cases before

spreading the road metal, would make a better foundation, and a shallow trench excavated on each side of the road, defining the width of the portion over which the metal is to be spread, would prevent it spreading under the roller. In regard to the quality of the road metal supplied, I find by various tests and observations that the material is very variable, but the specimens supplied were not properly prepared, and consequently the results do not warrant me in expressing anything more definite than what is contained in that portion of the report referring to this matter. In regard to the size of the broken stone, the specified gauge of $2\frac{1}{2}$ inches is too large for the top course, but even this is exceeded in the road, whereas all experience shows that better results are obtained with suitable metal when the maximum gauge for the top course is 2 inches, with sufficient screenings to just fill the interstices and insure thorough consolidation under the road-roller. The streets of Sydney have not been sufficiently rolled, consequently the road metal is not properly consolidated. Ten times as much rolling is necessary to make a durable road, and each layer of not more than 4 inches, preferably 3 inches, should be thoroughly consolidated before the second layer is spread, using a road roller weighing from 15 to 20 tons, passing from fifty to seventy-five times over every portion of the road from the sides towards the centre. During the process of rolling the metal should be abundantly watered. The binding material should be free from clay or other material liable to form mud when watered, and should consist preferably of the sweepings and scrapings of macadamised roads. The binding material should be spread on the top of each layer after it has been partially consolidated with the roller, but only a small quantity should be used, not exceeding 10 per cent. to 12 per cent. of the thickness of the metal, which should be rolled in until the metal is thoroughly consolidated, and the surface brought to a hard, smooth and uniform condition. (8) In regard to maintenance. It will not be possible to establish a proper system of maintenance in the first instance until the streets have been brought up to a uniformly better condition. When this has been done they will be more economically and efficiently maintained by periodical re-sheeting or recharging with road metal, accompanied by partial repairs or patching during the intervals. Experience shows that in city streets this method is preferable to the system of minute and constant repairs usually adopted on country roads in France subject to light traffic. The intervals between recharging will depend upon the traffic and corresponding

wear, and will vary from two to five years in Sydney. In patching defective portions care should be taken to thoroughly cleanse the surface and pick round the portion to be patched before depositing the metal, so as to insure a union between the old and the new materials. Small patches should be consolidated with the rammer, and, as far as possible, the surface should be properly restored before the traffic is allowed to pass over it. The recharging or resheeting need not always be extended over the entire surface of the road, as the greatest wear may be in the centre, but in any case a furrow should be excavated defining the width of the metal in the manner referred to in clause VII. (9) The streets should be swept periodically at least once a week, and the mud removed whenever it is found necessary to do so, the material thus obtained being used for binding in the construction of the new and the maintenance of old roads. The sweeping would be more effective if the street surfaces were in a better condition. The watering of the streets should be more carefully regulated according to the weather, so as just to lay the dust, and not so much as to cause the road to be muddy half the day. If a hose is used care should be taken not to injure the road surface or remove the binding material. The system of cleansing, watering and maintenance should be thoroughly reorganised under the supervision of the city surveyor, assisted by competent officers and overseers possessing experience in street maintenance. In view of the impossibility of economically maintaining macadamised streets in an efficient manner when subjected to a traffic exceeding 25,000 tons per yard width per year, no matter how perfectly they are constructed, all such streets should be paved with wood on a concrete foundation where this traffic is exceeded, either with new blocks or old ones which have been cleaned and recut, according to the traffic and the character of the street in regard to value of property, gradient, &c. Careful records should be kept as to the nature and amount of traffic passing over the principal Sydney streets and the results reduced to tons per yard in width; also the cost of maintenance, more especially in macadamised roads. The method described of calculating the annual cost of a street will show whether a particular method of paving is the most economical under the circumstances.

(10) The close-jointed timber pavements in Sydney are at least as good as the best in any city in the world, and their use should be extended as far as possible whenever justified by the weight of traffic passing over the street, or the annual cost of the macadamised street, provided that the gradient is not

excessive. (11) Flushing the wood-paved streets at night is an excellent way of cleansing them, and during the summer months they become dry before the heavy traffic commences; but during the four winter months, from April to July inclusive, they should not be flushed, as they remain wet during nearly a whole day and require sanding. This is especially noticeable in such streets as Park, Bathurst and Market Streets. The wood pavements should be sanded when they become slippery after wet weather to give a better foothold for horses, more especially when the gradient is steep, as in Liverpool Street.

(12) In regard to tarred metal:—The use of tarred metal in secondary streets of light and moderate traffic should be continued, but proper attention should be given to boiling the tar and incorporating it thoroughly with the metal.

In regard to footpaths:—Tarred metal footpaths are not good enough for the principal streets of a city; they may, however, be used for secondary streets of light traffic. (13) The best material for footpaths for a city like Sydney is asphalt, either a gritted mastic, compressed powder, or slabs of compressed asphalt. Asphalt should be used in preference to any kind of stone slab, and asphalt squares appear to be the best suited for the principal streets, as they can be lifted and relaid in case of repairs to pipes more easily than a monolithic pavement. It is desirable that all pipes, &c., under the pavements of the footpaths should be laid in subways, so that they may be repaired without disturbing the surface. It would be a great advantage to the City Council if a dépôt were established for laying asphalt pavements and storing the material, similar to the one in Kent Street for wood pavements, as the first cost of machinery and appliances would not exceed 6,000/., and would have sufficient capacity to lay 600 square yards in twenty-four hours, or about 200 yards of footpaths 12 feet wide.

After careful investigation and consideration of the subject Professor Warren submitted the following recommendations:—

1. That great care and vigilance be exercised in street construction and maintenance in accordance with the principles and practice described and discussed in this report. That all the details as to quality of materials, gauge and proportion of screenings and binding, rolling, watering and cleansing be rigidly enforced.
2. That a dépôt be established for laying asphalt footways with mastic, compressed powder or asphalt slabs, provided with the necessary machinery and appliances for preparing the material, conveying it to the site and laying the pavement.
3. That such reorganisation and additions be

made in connection with the staff engaged in street construction and maintenance as will enable the foregoing recommendations to be effectively and economically carried out.

CONSTRUCTION IN RELATION TO INSURANCE.

THE Underwriters' Association of Canada at a recent meeting decided to extend to the towns and smaller cities throughout the country the rule under which buildings are classified for insurance purposes according to the character and surroundings of the building. This system has been employed for some time in Toronto, and is generally acknowledged to be the most equitable one. It is obviously unfair that the owner of a building belonging to a certain class who takes precautions to guard against its destruction by fire should be obliged to pay insurance at the same rate as another owner in the same class who takes no such precautions. The situation and surroundings of a building also have much to do with its desirability or otherwise as a fire risk. These circumstances ought to be taken into account by the insurance authorities when fixing the rate of insurance to be paid. The more strictly this system is applied the more general will become the construction of fire-resisting and fire-proof buildings. It is said, on the authority of prominent insurance firms, that during the last five years the rate of insurance on this class of building in Toronto has been reduced by 50 per cent., which should certainly offer a strong inducement to persons proposing to build to employ fireproofing methods and materials. Care should be taken, however, to see that when these materials are employed, the system of fireproofing is carried far enough to place the building in the favoured class. Prominent buildings have been erected in Toronto within the last three years in which the ceiling and floors have been fireproofed while the stairways have been left open to act as flues and cause the destruction of the building in case of fire. A partial system of fireproofing like this which disregards essential features, such as those mentioned, is valueless, and the money expended on expensive materials wasted. The record of fires in Toronto last year is very gratifying. The total number of fires was 686. For 328 no losses occurred, and for 221 the loss in each case was less than 100 dols. The losses above insurance totalled only 13,289 dols., and the losses without insurance to only 9,434 dols. Only one fire extended beyond the building in which it started,

which would seem to point to a high standard of efficiency of the fire department. To what extent improved methods of building construction contributed to this excellent showing is not known, but it may reasonably be presumed that some credit is due in this direction. The record of fire losses in the United States for the first six months of the present year shows the total losses to have been 88,935,000 dols., as compared with 103,299,000 dols. for the corresponding period of last year.

SUGGESTIONS FOR USING PORTLAND CEMENT.

KEEP the cement perfectly dry until ready to use it in mortar.

Use dry, clean, sharp sand, and use the least amount that will fill the voids. Increasing the percentage of sand reduces the strength and slows the setting. Wet up only so much mortar at one time as can be used before setting commences.

Do not permit the finished work to dry out quickly; after it has commenced to harden cover with wet sand or burlaps and keep wet for a fortnight. Concrete ditches, flumes and reservoirs should be washed over with a thin cement, grouting fast as built. After the mortar has set a day or two it is well to flood it and keep the water standing stagnant a fortnight.

If the finished work cannot be kept covered as above, keep wetting it by daily sprinkling. Water is the life of Portland cement mortar.

When concrete is laid in large bodies it is allowable to imbed irregularly throughout its mass as many large stones as is consistent with their being well bonded together by the mortar.

In concrete it is desirable that the aggregates should be graduated in size, then they pack closer and require less cement mortar to fill the voids. The stone should be hard, angular and free from dust.

Do not mix lime with cement, it tends to make the mortar crack.

In masonry the stone or brick should be thoroughly wet before laying.

In sidewalks, as fast as the concrete is tamped to a surface the top coat should be spread on in order to bond the two layers together.

Ordinary lampblack injures cement mortar, mineral colours do not; sienna, Prince's metallic, Venetian red, Prussian blue, ground coal or oxide of manganese are good.

ST OF WORKS AND BUILDINGS IN WHICH CATTYBROOK BRICKS AND TERRA-COTTA
HAVE BEEN USED, ALSO SAMPLES, FREE ON APPLICATION.

Before laying concrete the ground should be saturated with water and rammed to prevent absorption of moisture from the mortar or setting.

The longer a Portland cement is kept the slower setting it becomes, provided it is not kept in an airtight package.

Portland cement factories can usually furnish either a slow or quick-setting cement if allowed sufficient time to meet the requirement.

The better the ultimate quality of concrete the slower it is in hardening.

The aggregate used in making concrete, whether it be crushed stone or gravel, should be clean, hard, angular and durable. If crushed stone be used it must be freed from the dust that adheres to it in passing from the crusher. This can be done by turning water on it. The stone should also be screened, not to secure a material of uniform size, but to keep the sizes between maximum and minimum limits.

No parts smaller than coffee beans or larger than $1\frac{1}{2}$ inches in any direction should be used. All dust should be screened or washed out.

The amount of water needed will depend upon the percentage of voids between the particles, and should be sufficient to completely fill the spaces and bond the stones together.

Good gravel affords a cheap and durable material, for concrete, the difficulties are that it is liable to be dirty the pebbles are not angular, and as used it often contains an excess of sand.

THE SANITARY REGULATIONS OF NEW BUILDINGS.

At the meeting of the Sanitary Association of Scotland a paper on "Some Moot Points in the Sanitary Regulations of New Buildings," was read by Dr. A. Campbell Munro, Paisley, officer of health for Renfrewshire. In a damp, rainy climate the question of the prevention of dampness in dwelling-houses was one, he said, of primary importance. There was no doubt that residence in damp houses predisposed one to rheumatism, consumption and lung disease. And of the elements in the prevention of dampness none was of greater importance than the material of which the damp-course was principally composed. Now he was advised by the most competent architects that in our wet climate the Caithness flags or lead (which, however, were seldom used) should be required in

the case of all main walls. Just a few days ago he was present at a committee meeting, at which the operations for the enlargement of a building, erected six years ago, were under consideration, and the architect reported, as a result of an examination of three separate points where the walls had been taken down to the foundation, that there were no damp-courses in the walls. Now he (Dr. Munro) had been able to assure the meeting that when the building was being erected he had seen the damp-courses laid. Yet those damp-courses laid only six years ago had absolutely disappeared; they had been made of "an asphaltic composition." Dealing with ventilation, he argued that every habitable apartment should have a fireplace and chimney flue, the next best thing being an upcast shaft. After pointing out the dangers of the concealed bed, he spoke of the necessity of good back court ventilation, and the advantages of back lanes for ventilation purposes, whilst the lanes could also be used for the passage of drains leading to the houses, thus obviating the present objectionable arrangement of carrying drains under closes, a system which often led to sewer gas finding its way from the drains under the close into the houses. In reference to all drains, and the entire sanitary fittings of houses, these should be carefully and most accurately examined, whilst internal soil-pipes should be avoided and the pipe placed out from the wall naked and unashamed.

Dr. Munro moved—"That the Sanitary Association again place on record its approval of the movement for the registration of plumbers as being calculated to promote the sanitary condition of dwellings by securing efficiency in their drainage and plumbing work, and advises the council of the Association to support the Plumbers' Registration Bill when that measure is reintroduced into Parliament."

The resolution was carried.

HOUSING THE SCOTTISH LABOURING CLASSES.

At the Congress of the Sanitary Association of Scotland in Paisley Mr. Peter Fyfe, sanitary inspector, Glasgow, read a paper on "The Advantages and Disadvantages of Housing the City's Labouring Classes in Areas outside the City." When he spoke of the housing of the poor he meant the housing of a man or woman who did not earn on the average more than 25s. per week, or of a household whose earnings did not exceed 30s. It would assist them in the consideration of the matter if

they agreed that persons in households making more than these sums per week were excluded meantime from their calculation. Then how best could they house comfortably and sanitarily the thousands who come within the figure, and under what conditions was it practically possible to suitably accommodate them with the best economy to themselves and with the least burden to the general community? Manifestly there were two methods—(1) To acquire land in the country and build cheap dwellings there, providing for them rapid transit at very low rates; (2) to acquire sites in the town and erect three or four-storey blocks at distances convenient to their spheres of labour. There were very high authorities who saw in the first proposition the only solution of the problem, particularly as it was set in such cities as London, Glasgow, Liverpool and Manchester. There were others who condemn in no measured terms such proposals as quite utopian, as Mr. Hunter, of the London County Council, who stated to that august body that "he knew these people man to man, and that it was mere folly to say that they—the casual labourers, who had to follow their work day and night at all hours—could go and live in the suburbs." Mr. Fyfe then pointed out the advantages of the country as compared with town residence. In this connection he instanced the facilities given by the railway companies to working men for cheap travelling, the companies taking working men seven miles to Clydebank or Paisley for 1s. per week. It was reasonable to think that if the companies could carry men that distance for 1s. they might carry them, say, to Tollcross from the city for 6d. per week. With a reduction such as this, many might be induced to abandon their city haunts, but without it the allurements and the acknowledged conveniences of a city would outbalance in the mind of the labourer the hygienic advantages of green fields and fresh air. But, setting aside sentimental and family reasons, and looking simply at the financial side of the question, it seemed to him impossible to expect any solution of the problem by acquiring ground in the country until Parliament takes the whole question of railway and tramway rates for the poorer classes into serious consideration. It was obvious, looking at the table of railway rates and the corresponding distances travelled, that there was a want of system. The zone system was not in operation in Glasgow, for a poor person had as much to pay in order to travel from Glasgow Cross to Partick as to go on to Clydebank, and while he could get from Glasgow to Paisley and back for 2d. per day, he had to pay 4d. per day to get to Barrhead, practically the same distance. Mr. Fyfe then gave

statistics showing the cost of erecting working-men's houses in Glasgow, London, Manchester and Liverpool, and whilst so doing he emphasised the fact that both in town and country most dwellings for poor people were not, either in size or structural requirements, suitable as healthy houses. In concluding, he said that his general conclusions were that—(1) Wherever the price of land exceeds 30s. per square yard the housing of the poor upon such land cannot be accomplished so as to meet the requirements of sanitation and the necessities of sound finance; (2) before the erection of labourers' dwellings in suburban areas on cheap ground can be undertaken with economic safety to the municipality or other undertakers it is essential that railway and tramway companies shall reduce their fares to poor persons to about 1d. per day for the return journey, or 6d. per week; (3) in cases where ground in a town is dearer than 30s. per square yard, or the cost of transit to and from suburban areas is not considerably less than 1s. per week, the housing of the poor cannot be accomplished in accordance with healthy conditions, without great risk of loss to the undertakers, or otherwise without laying a burden on the general rates; (4) where ground within a city or town can be secured at less than 30s. per square yard, the municipalities may erect blocks of sanitary dwellings for the poor and rent them without necessarily incurring financial loss, or causing undue risk to the health of the tenants.

Mr. Fyfe said he would like to follow up what he had now stated by moving a motion:—"That in the opinion of this Congress of the Sanitary Association of Scotland the problem of the housing of the poor in suburban areas, or in the country, cannot be solved until the rates charged for transit to or from the city or town are so reduced as to make the country rents, plus travelling expenses, lower than town rents are presently charged in modern sanitary dwellings."

After discussion, the subject was referred to the council of the Association for consideration.

THE WORKMEN'S COMPENSATION ACT.

A SPECIAL committee of the Trades Union Congress, after considering the ten notices of motion with respect to the necessity for amending the Workmen's Compensation Act, recommended that the parliamentary committee should urge upon the Government and Parliament the desirability of amending the Workmen's Compensation Act 1897, in the

To be obtained through Hardware Merchants, Factors, or Wholesale Ironmongers, through whom our Catalogue of General Brassfoundry may also be obtained.

following particulars:—"That the basis of claim be fixed on the average wage per hour as representing a week's earnings instead of the average week, as at present. That all work-people, of whatever trade or calling, be brought within the operations of the Act, and that compensation be paid for all injuries sustained in the course of their employment. That the 30 feet limit, as regards buildings, &c., be deleted from the Act; and also that the fourteen days' limit, as regards liability, be abolished and the compensation be paid as from the date of the injury. That Schedule 1 (B) be amended so as to read as follows:—Where total or partial incapacity for work results from the injury there shall be a weekly payment during the incapacity of not less than 50 per cent. of the recognised rate in the trade or calling to which the injured person may belong, but in no case shall the compensation paid fall below 10s. (ten shillings) per week for persons over eighteen years of age. Young persons under the age of eighteen permanently injured in the course of their employment shall have their compensation fixed on prospective earnings; and in the case of adults permanently injured a judge shall have power to grant a lump sum as compensation. In no case shall a person who is in receipt of compensation be compelled to undertake any work other than that in which he was engaged when he met with the injury.' Also that subsection (C) of section 2, which reads, 'If it is proved that the injury to a workman is attributable to the serious and wilful misconduct of that workman, no compensation claimed in respect of that injury shall be allowed' be deleted."

HOUSES FOR THE LABOURING CLASSES.

At the Engineering Congress, Glasgow, a paper was read on "The Problem of the Housing of the Labouring Classes, with Special Reference to Suburban Districts," by Mr. A. H. Campbell, engineer and surveyor, East Ham Council. He said his Council had secured Government approval of a scheme for the erection of fully 540 separate houses, and the scheme, including outlays for land charges, formation of roads and contingencies, would cost 120,000*l.* The question of transport was of very great importance in dealing with this problem. If abundant, cheap and ready means of transport were not provided, then the labouring classes would continue to crowd together in the hearts of the cities, and because of its importance as a factor in the problem it was one among many weighty reasons for the municipalisation of the tramway service. It might be assumed,

the author thought, as a rule that any inclusive rent exceeding 1*s.* a day became burdensome to the class of tenant sought to be catered for by a public authority, who was supposed to be in receipt of a maximum wage of 30*s.* per week. He submitted that the workman's ideal house should have an entrance and an exit independent of any other house, and should have the following accommodation:—(1) Kitchen of 144 superficial feet; (2) scullery with small range, copper and bath, of 70 feet; (3) parlour, usable as a bedroom, of 125 feet, and (4) bedroom of 96 feet; making a total of 435 superficial feet, together with arrangements for coals, water-closet, clothes closets and larder. This was the class of houses at East Ham. On plans such as these there might grow up around the outskirts of our great cities ranges of plain, substantial, well-appointed labourers' cottages, fulfilling the ideal of homes for the rearing of healthy offspring, untainted by evil and squalid surroundings.

The chairman (Mr Mawbey) asked if it was not a fact that poor people, earning from 25*s.* to 30*s.* a week, had to go into lodgings or to go two families into one such house as Mr. Campbell had described.

Mr. Campbell: We do not permit two families in a house, nor lodgers either, at East Ham.

The Chairman said it was just a question whether it was not advisable to have some two-roomed tenements at a less rent, perhaps at 1*s.* 6*d.* a room per week. It appeared to him that that was the great necessity of large cities.

Mr. J. Lobley, Hanley, said it seemed to him that the working-class tenants wanted municipalities to provide houses worth 7*s.* per week, but for which the tenants would have to pay only 3*s.* 6*d.* What was wanted was the class of houses that would be suitable for the people living in the slums when they were forced to remove owing to public improvements and for other reasons. Private enterprise made no provision for these people, and he should like to have seen some feasible plan suggested by which that want could be met. The nearest approach to what he desiderated he had seen in Edinburgh, where suitable houses had been erected by the Corporation, but the rents there were higher than in Hanley. To provide houses such as those suggested by Mr. Campbell would result in the creation of a privileged class, which for many years at least would be a minority. They would have a house of a market value considerably greater than their neighbours who would be paying the same rent, and the ratepayers would have to provide the difference.

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

**NO OUTSIDE PAINTING REQUIRED.
PERFECTLY DUSTPROOF.**

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass.

SUITABLE FOR ALL KINDS OF ROOFING,

Such as Weaving Sheds, Engineering Workshops, Railway Stations Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description &c. &c.

This System allows for full expansion and contraction of glass and absorbs any vibration machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

Mr. Munse, Belfast, maintained that the mistake in planning these workmen's houses was that the gentlemen who designed them were more used to planning mansions than working-class dwellings. The workmen's houses in some parts of the country were too substantially and permanently built, and were too well finished. If some gentlemen would get rid of the big ideas they had and try to build for the working people and not for the aristocracy they would find that they would suit the people far better.

Mr. Campbell, in replying, said Mr. Munse's observations applied to Belfast, but they were not correct as applied to the Metropolis.

ST. BENET'S MINSTER.

THE first portion of St. Benet's Minster, Beccles, was opened with considerable pomp on the 4th inst. The edifice forms a very handsome addition to the architectural features of the town. The position of the buildings in existence prior to the commencement of the Minster rendered it impossible that the Minster should be orientated, consequently it lies north and south; the chancel, which is not yet built, being to the south. The material employed for the interior is Bath stone, and for the outside Ancaster stone with Bath stone dressings. The Minster when completed will consist of nave and aisles, with west porch, a baptistery to the east, central tower and transepts, sanctuary and lady chapel beyond, the aisles being continued round the sanctuary. Up to the present the nave and aisles, together with the foundations of the west porch up to the plinth line, are all that are completed. Above the arches of the nave are the triforium and clerestory. The confessionals are at the south end of the west aisle, and the organ—which is the same one as used in the temporary church—is placed in the west aisle. West of the choir aisle will be the sacristies and statio. The main entrance is on the north from St. Mary's Road, being 12 feet 6 inches above the crown of that road, and is approached by steps and terraces. The north porch is formed from the thickness of the wall, and has a depth of 8 feet 6 inches. The extreme interior length from lady chapel to the north porch will be 182 feet. The dimensions of the nave are 84 feet in length, consisting of seven bays, with a height of 40 feet and width of 21 feet. The aisles, which are designed merely for processional purposes, are 84 feet long by 7 feet wide, and 16 feet in height. The tower will be 25 feet square externally, and will rise to a height of 81 feet above St.

Mary's Road. The floor of the sanctuary will be 3 feet above that of the nave, and there will be another rise of 3 feet in the lady chapel. The roof of the nave is barrel-shaped inside, lathed and plastered. The bay over the temporary altar is handsomely decorated in gold, with shields containing sacred emblems. The arches of the nave are supported by massive piers. Against these are semicircular shafts, which rise to the spring of the clerestory windows, where they end in a cap. Here the principals of the roof begin, and to them are mortised ribs, which are carried over the nave, forming circular arches to each bay. The nave is not benched, and the floor is of cement. The pulpit, which is presented to the church by the architect's father, Mr. F. Banham, is of Caen stone with marble columns with handsomely carved caps, and although not quite in keeping with the Norman style of the building, is a very effective piece of work. On the right hand side as the west porch is entered is the chapel of the patron saint, St. Benedict, in which is a miniature copy of the statue of St. Peter at Rome. On the left hand side of the entrance to the monastery and cloister is a statue of the Sacred Heart; on the right the statue of St. Anthony of Padua, whilst on the right hand side of the altar rail is a statue of St. Joseph. The special feature of the east aisle is the shrine of Our Lady of Good Counsel, made beautiful with gold and colouring, and containing a copy of the miraculous picture at Genazzano. On the right of this, close to the pulpit, is a facsimile of the statue of the Holy Child of Prague. The interior will be lighted by gas, incandescent burners being used. The style of architecture is that of the Norman period shown in the massive piers of the nave, 4 feet 6 inches across, and the outer walls 2 feet 6 inches. Finally, the general plan of nave and aisles would remind those who have seen it of the beautiful Norman church of Blyth, on the borders of Yorkshire. The north façade might recall ideas of Kirkstall and Landisfarne, and the transepts and south end Ramsey. Iffley, in Oxfordshire, pays its contribution in the tower, and old historic Benedictine Glastonbury gives its support to the fabric in the buttresses of the lady chapel and baptistery. The architect is Mr. F. E. Banham, of Beccles, and the contractors are Messrs. Allen, of the same town, whilst Mr. W. Gibbs (Beccles) has been responsible for the glazing, painting and gasfitting. The present temporary church of St. Benet's will be altered so as to form the cloister and hall for social and parochial purposes. It must be added that a handsome high altar and tabernacle are now being designed, the cost of which—500*l.*—is being met by

BUILDING RITES.

A BOOK has been published in America on Foundation Rites, &c. Apropos of it, a writer in *Stone* says:—

When the master masons and builders in the dim ages of antiquity erected their elaborate temples and fanes they doubtless imagined that the structures of solid stone would stand until the end of time as monuments of their taste and industry. But the storms of the centuries beat down upon them and the sands of the deserts pitilessly pelted them, and they crumbled into decay. Many of them have passed wholly out of the ken of man; others are revealed only in disjointed fragments by the spade of the tireless archæologist, while a few survive as hoary ruins that scarcely reveal their original intent and purpose. If the builders, then, could realise what had become of their handiwork, wrought in eternal stone, would they credit the fact that the ceremonials with which they hedged about the erection of the walls would actually survive the masonry and laborious carving itself? All about us, in the present enlightened age, are customs and ceremonials connected with building that had their origin in the far back pagan days. They have been handed down from generation to generation like the unwritten rituals of a great secret order. When our public buildings are dedicated, and public functionaries lay the corner-stone with silver trowels, we are simply following out the customs of our forefathers, with such modifications as the advance of civilisation has made necessary. In the olden days, when life was cheaply held and superstitions were rampant on every side, it was the invariable custom to immure a living being in the walls of a building or to crush him beneath the foundation-stones. The purpose was doubtless to propitiate the evil spirits or to give the building a spirit of its own.

In Alaska, before the United States began to govern it without its consent, human foundation sacrifices were common. The site of the fireplace was marked, and postholes were dug at the four corners. A blindfolded slave was made to lie down, face uppermost, on the spot chosen for the fireplace. A sapling was laid across his throat. At a signal the two nearest relatives of the house-owner sat, one on one end, the other on the other end of the sapling, choking the poor wretch to death.

Four more blindfolded slaves were brought forward. Each was made to stand in a posthole and was clubbed to death "with a club ornamented with the host's coat-of-arms." Among the Dyaks of Borneo, when a house was to be built, a big hole was dug for the first post, which was suspended over it. A slave girl was dropped into the hole and crushed to death. In 1881 the King of Ashanti put to death fifty girls and mixed their blood with the mud wherewith he repaired the royal palace. The kings of Burmah buried four human beings alive at the corners of the capital, that their spirits might keep watch and ward off invasion. In the Japan of the seventeenth century, when a great wall was to be built, a slave would voluntarily lie down in the trench and be crushed to death by great stones lowered upon him. Human skeletons are often found in walls of old buildings and foundations of old bridges. Many times in Asia there have been popular panics caused by the fear that the old foundation customs were to be revived. As the Siberian railroad drew near the Chinese frontier there was a great hullabaloo in Peking. It was rumoured that the Russian Ambassador had asked her Humanity, the present Chinese Empress, for a couple of thousand children to bury under the rails. There was a similar scare in Calcutta when the Hooghly Bridge was building. The natives got it into their heads that after long refusal Mamma Ganges had agreed to be bridged on condition that each pier should rest on a layer of children's heads.

Ultimately animals and animal and vegetable products were offered instead of human beings. That Naples is built on an egg is known to all readers of the Mediæval legends about the great enchanter, Virgil. A tallow candle was built into the wall of St. Osyth's, Essex. A chicken, cock, lamb and so on takes the place of a slave or other human victim. A living blind dog buried under a stable threshold will keep the cattle from straying. The burial of a live dog is also a good remedy for quicksands. There is a Russian folk-belief that the first person to enter a new house will die within the year unless an animal is killed and buried when the first stone is laid. Or at the first axe stroke the carpenters must call out the name of some bird or beast, which beast or bird will positively die during the year. "In modern Greece," Mr. J. G. Fraser tells us, "sometimes, instead of killing an animal, the builder entices a man to the foundation-stone, secretly measures his body or a part of it, or his shadow, and buries the measure under the foundation-stone; or he lays the foundation-stone upon the man's shadow. It is believed that the man will die within the year. In the island of Lesbos it is deemed enough if the

builder merely casts a stone at the shadow of a passer-by; the man whose shadow is thus struck will die, but the building will be solid. A Bulgarian mason measures the shadow of a man with a string, places the string in a box, and then builds the box into the wall of the edifice. Within forty days thereafter the man whose shadow was measured will be dead and his soul will be in the box beside the string, but often it will come forth and appear in its former shape to persons who were born on a Saturday." In these cases the shadow is the life, soul or strength, according to a common article of primitive faith, no harder to believe, perhaps, than most other things are.

But let us borrow a Roumanian folk-tale from Mr. Burdick. Radu the Black had promised Manoli and the other masons gold in piles and titles to burn if they would build him the fairest palace ever seen; but if it was not up to specifications he swore that the bunglers should be walled up in his monastery. Four days the masons worked, there being no union to prevent them. Four nights all that they had built tumbled down, toppled over, we may believe, by the walking delegates of the devil. On the fourth Manoli had a dream of dread. A voice had sounded in his ear that every night would undo the toil of the day if the masons didn't build, living, into the wall the first woman that should come upon them. Manoli told his dream to his fellow workmen. All took oath to obey the voice. The next morning Manoli, full of black presentiment, stood upon the scaffold and watched the country round about. His wife, Flora the Beautiful, was coming with his breakfast. He held her in his arms while the wall of death was rising around her. When she could be seen no more he could just hear her moaning faintly:—"Manoli, Manoli, the wall is pressing on me and my life is dying out." And now the palace stood solid. Soon it was finished, magnificent, a wonder of the world. The masons stood upon the scaffolding awaiting Radu and the glorious wage.

By the prince's command the props of the scaffolding were knocked away and the masons dashed to death. Manoli clutched a projecting carving and would have saved his life had he not heard just then from beneath the wall the feeble, moaning voice:—"Manoli, Manoli, the cold wall is pressing on me; my body is crushed; my life is dying out." So down among the dead men let him lie; and serve him right. The bridge of Arta trembles like a flower stalk because the master builder's wife cursed it, when following an evil dream he made her don her best clothes and go down to the central pier and there be buried.

There are some ceremonials still followed in building in America that it would be worth while to study closely. Such, for instance, is the custom that obtains in all parts of the country of fastening up the "roof-tree" when the framework of the roof is finally in place. We have heard it said that the symbolic meaning of this ceremonial is that the framework of the house is supposed to have made use of the trunk of the tree, and consequently the topmost crown of the tree itself is hoisted up to occupy its old place once more. If this was the origin of the custom it was doubtless a rite of propitiation. In this prosaic age, however, the purpose of the ceremonial is evident. It is an invitation from the builders to the owner to recognise the progress that has been made by a donation of liquor or cigars. It is a hint that is almost always efficacious and that brings out the expected reward. A particularly interesting feature of this ceremonial is the modification that has come about with changed conditions in building. The "roof-tree" is not confined to wooden houses, but it is changed into a flag in the great steel structures that are erected in our cities.

In this connection it is interesting to note the important part that donations of liquor have played in building in the American colonies, especially in those which had a large proportion of Dutch settlers. It was long a standing complaint that the most onerous part of the expense in church building was the enormous bill for liquors for the workmen. Fortunately we have some exact records. A detailed example of the imperative furnishing of liquor to workmen is found in the bills that have come down to us for the erection of the first stone house in Albany in 1656. This was a Government house or fort, and it cost 12,213 guilders in wampum, or about 3,500 dols. Jan de la Montague, the vice director of the fort, was the official in charge of construction. Although of stone, it might almost have been floated in the liquor that it took to build it. When the old wooden fort on the site was torn down a tun of strong beer was furnished to the workmen. When the first stone of the new edifice was laid an anker (33 quarts) of brandy and 32 guilders' worth of other liquor were called for by the workmen and duly served. So much as a start for the masons; the turn of the carpenters came when the cellar-beams were laid. They were satisfied with two barrels of strong beer, three cases of brandy and 72 florins worth of small beer. This satisfied them until the second tier of beams was laid, when they had two more cases of brandy and a barrel of beer.

There was no chance for dry-rot to attack these beams, for

they had all been "wet" previous to laying. They were stacked up without the walls, and were brought inside one by one by eight men as they were wanted. For each beam carried these men were given half a barrel of beer, and there were thirty-three beams in all. All of the teamsters, wood-carriers, carpenters, stone-cutters and masons had a daily allowance of a gill of brandy and three pints of beer apiece at dinner, besides the special treats they forced out of Jan de la Montague. This did not satisfy them, however, and they "struck" for another daily pint of beer. Every man who was even remotely connected with the building had to be taken care of in the matter of liquid refreshment. The carters who brought the wood from the forests and the sawpits, and the boatmen who floated spars down the river had access to the liquor barrels of the fort.

When the roof-tree was set in place the carpenters were satisfied with a half barrel of beer, surely a most modest demand. Under the name of "tiles beer" a half barrel went to the tile setters. A winding staircase was a feature of the fort, and when this was finished five guilders' worth of liquor gave the workmen the necessary winding gait to test it.

Perhaps there were other drinks "on the side," although the records do not specifically mention them. When the fort was finally completed the workmen loudly demanded a kraeg, or housewarming, of both food and drink for all the workmen and their wives and families. But the patience of Jan de la Montague was exhausted, and he incontinently refused to pay out another stiver for drinks. Perhaps he had just been figuring up his bills for liquid refreshments, for when he presented his report no less than 716 guilders were set down for the cost of drinks. One-eighteenth of the cost of the building went down the throats of the workmen. What a noble thirst there was in the old days. Fortunately, the building customs have changed from those strenuous times, or only brewers would be able to build houses.

THE AUSTRALIAN HARD WOODS.

THE use of the two Australian hard woods, Jarrah and Karri, especially for wood-paving, is dealt with in an article in the "Bulletin of Miscellaneous Information" (November and December 1899), which is issued as an occasional publication from the Royal Botanic Gardens, Kew. The article embodies

a report upon the forests of Western Australia by Mr. J. Ednie Brown, the conservator of forests for the colony, who is since deceased. As illustrating the adaptability of Jarrah wood for all kinds of outdoor work, Mr. Ednie Brown remarked that in the office of the department "there are specimens which have been obtained from piles and girders sixty years old. These were driven and used in local harbours and bridges. When obtained for the department the timber appeared to be perfectly sound and free from any signs of decay whatever; if anything, the wood seemed to be harder, more solid and apparently more durable than freshly-cut timber. At all events, it seems capable of standing wear and tear for 100 years longer. From its immersion in water it certainly appeared darker in colour compared with newly-cut timber, but no decay whatever is apparent." Karri has very much the appearance of Jarrah; indeed, so like are the two that it takes a good judge to distinguish them. It is hard, heavy, elastic and tough, but cannot be wrought so easily. For underground or waterworks, Mr. Ednie Brown says, "The timber is certainly inferior to some other kinds, especially to Jarrah; there can be no doubt about this fact, which has been demonstrated time after time in the colony. Still, it is only fair to say that instances have been brought under my notice where posts and slabs of the timber have been known to have been in the ground for thirty and forty years with only an ordinary amount of decay. This is certainly very puzzling, and makes one doubtful in regard to the conclusions generally which have been arrived at in regard to this timber. However, as may be seen from the comparative tests which have been made in regard to its tensile, crushing and breaking strength, it is a timber of a very high order. We must therefore, pending other and more general experiments, look upon the Karri timber as one best suited for superstructural works. For bridge planking, shafts, spokes, felloes and large planking of any sort, flooring, general waggonwork, beams, it is unequalled in this colony. In lateral strength it is very much stronger than Jarrah, and for works requiring the bearing of considerable weights, such as bridges, floors, rafters, beams of various kinds, it is of great value. In our railway sheds the wood is now much in use for the construction of waggons of all sorts. It shrinks laterally, but not to any great degree in a longitudinal direction. Altogether, the timber is a most valuable one. For street blocking it is most valuable, and for this purpose seems to be equal to, if not better than the Jarrah, in that its surface by the wear caused by the traffic does not render it so slippery for the horses' feet."

The Architect.

THE WEEK.

THE Select Committee of the House of Commons recommend an expenditure of 30,000*l.* on improving the accommodation for members. Of that sum 13,300*l.* is required in connection with the smoking-room, which at present is always inconveniently crowded, and being over the kitchen is very hot. It is proposed that the present members' smoking-room be used as the strangers' dining-room, that the middle dining-room be reserved for members only, and that the third dining-room, next the House of Lords, be used as a smoking-room. But as one room is insufficient, the report says it is possible, by making a few other reappropriations, to construct beyond the present strangers' smoking-room a series of three large rooms of the size of the last-named, each measuring about 47 feet by 25 feet and 13½ feet high, fronting the Terrace. These rooms would form a suite separated by doors, with access also to each from a corridor running the whole length of the library corridor above. The two nearer rooms should be appropriated for members' smoking-rooms, and the furthest or most northern room for a members' reading-room. Improvements in the ventilation and alterations in the kitchen will cost 950*l.* Enlarging the refreshment-room for ladies in the gallery and providing a refreshment-room for witnesses, who sometimes number 1,800 a day, with rooms for the chaplain, clerks, &c., will require 1,550*l.* Inconvenience is often caused by the defective ventilation of the committee-room, and it is recommended that the whole of the suites should be dealt with without further delay, so that the improvements may be completed before another session. Time has not enabled the committee fully to inquire into the general system of ventilation employed in the building, and they suggest that this would be a fitting subject for further inquiry at an early date.

In a paper read at Glasgow on the "Real Incidence of Local Rates," by Mr. CAMERON CORBETT, M.P., it was explained that the incidence of local rates is fundamentally influenced by the question as to whether the area affected by them is fully built up or is affected by a practical chance of additional accommodation being provided within it. If it be fully built up, then the rate falls on the owner except in so far as the cause of the rates is calculated to affect the rents beneficially; that is to say, the burden of wasteful administration would fall upon him. In the cases where a higher rate affects an area where building can be influenced by it, the burden falls on the tenant in the same way as the burden falls on the consumer of a manufactured article, production being checked thereby. The proposal, after taxing building and land together, to put a special second burden on land values would raise the price of houses to buyers, and consequently the rent to tenants. The reduction of four years' purchase in the selling price of ground rents which has taken place during recent years has amounted in many instances to more than the whole cost of the land, and has therefore affected the production of houses unfavourably for the occupiers in these cases as if the cost of the land had been doubled. It is quite evident that land values being exposed to a special rate would affect the buyers and tenants of houses very severely, for the builders would require to get as much additional inducement from the buyer of the house as would counter-balance the lessened amount they would receive from ground-rent buyers.

It is interesting to learn that England is not exempted from seismological movements, but as they are infinitesimal we cannot say ignorance is bliss. There are observers who are watchful of all indications of change, but nature will not, to gratify them, depart from the ordinary course. According to the last report on the subject, at the end of March Professor H. H. TURNER, F.R.S., visited Shide, in the Isle of Wight, where, in conjunction with Mr.

JOHN MILNE, the secretary, he measured the stiffness of various piers employed to carry seismographs. To make a measure of this description a rope was tied round the column to be tested about 2 inches from its top. A spring balance was attached to this, and a pull of from 5 to 30 lbs. was exerted, with the result that the column was deflected. These deflections were measured by an astronomical level standing on the column, and in certain instances also by the deflection of the boom of horizontal pendulums. The stiffest column tested was a 12-inch earthenware drain pipe 3 feet in length. The apparent deflection was 0.09 inch per 1-lb. pull. A brick column 6 feet in height and in cross-section 3 feet by 1 foot 6 inches had per lb. pull a deflection angle in directions parallel to its sides of 0.192 inch and 0.05 inch, the latter referring to its greatest width. At Shide the piers rest upon the disintegrated outcrop of beds of chalk, which form the east and west backbone of the Isle of Wight. There are records of 31 or 33 movements at Shide, but the sum of the amplitudes in seven cases was worked out 17.3 millimetres, or a little over half an inch in all. The amount in a single case is so small as to be beyond analysis. It is no wonder the tremors have been ascribed to the firing of heavy guns. People who possess capital need not be deterred by apprehension of earth movements from investing their money in new buildings, for this week's Scottish experience is exceptional, although even in Inverness there was no collapse.

THERE is not much sentiment in engineering, but it would be regrettable if the name of STEPHENSON ceased to represent a builder of locomotives. When "Old GEORDIE" succeeded in making one there was no fine distinction between mechanical and civil engineers; he therefore considered he was acting rightly in constructing a line of railway for "Puffing Billy" to run along. He set up a factory for locomotives in Newcastle-on-Tyne, and he was willing at the same time to lay out lines in all parts of the country. The firm of ROBERT STEPHENSON not only continues to exist, but the demand for their engines has so increased, it has been found necessary to establish new works in Darlington, a town that must be mentioned in every history of English railways. A large area of land has been purchased at Springfield, and in addition to the works, about five hundred houses will have to be erected for the accommodation of the staff and workmen. The plans have been prepared by Mr. W. NORMAN, and the contractors are Messrs. SANT & SONS, of Newcastle-on-Tyne. The erecting shop will measure 140 feet by 220 feet, and provision has been made for enlargement. The offices have a frontage of about 160 feet. It is needless to say electricity will be used not only for lighting, but for motive power.

M. GAUTIER, who has gained reputation as a technical journalist in Paris, has proposed that the roads and ground over which the French troops will pass when reviewed by the CZAR should be saturated with oil on the American system, in order that the Imperial visitor may not be incommoded by dust. As the friendship of France and Russia is based on finance, it is suggested that if the oil were derived from Russian sources it would be more agreeable in odour to the CZAR. English road surveyors, or rather the authorities they serve, have yet to learn the advantages of petroleum as a material for keeping roads in good condition. In some parts of the United States its use is common. A board of inquiry lately visited Southern California, which is partial to oiled tracks, and found that the oil is heated to 180 degrees Fahr. for the first application and to 230 degrees or more for the second, and it may be transported for 10 miles in the steel tank of the sprinkling waggon without detrimental loss of heat. In other districts, where the oil is applied cold, the cost is about two-thirds as much, but the result is not so good. In one county, a public heating plant has been built which supplies three districts, and another is under construction. On one line of road about 200 barrels were used at each application, but that is double the usual quantity. The board recommended the oiling of existing macadam roads and then covering them with sand or decomposed granite.

SCIENCE IN ENGLAND.

FOR anyone who might be disposed to believe that England is a "nation of shopkeepers," there could not be a better corrective than the reports of the Glasgow meeting of the British Association. Shopkeeping has become so universal, the English people can no longer be supposed to be described by NAPOLEON'S saying. Indeed, the emperor and his army tried hard to make war profitable to themselves, and the penalties which were imposed on various countries for the privilege of having been invaded by Frenchmen were only another name for profits. Still it is assumed, or pretended to be, that in this country trade is omnipotent, and pursuits which elsewhere are followed unselfishly are with us degraded into money-making transactions. One reason, no doubt, for the belief is the parsimony shown by the State in the support of science, art and literature. So few instances of generosity on the part of the State can be recorded, it is natural that foreigners should suppose the indifference of successive Governments corresponds with the indifference of the people, and that intellectual pursuits are only valued in proportion as they can be made to pay. The reports of the Glasgow meeting should serve as a refutation of such a fallacy.

The truth is that this year the majority of the addresses and papers treated of subjects which were "caviare to the general." The manufacturers and merchants of Glasgow will sustain a comparison for knowledge with their foreign rivals, but we fancy they would not hesitate to declare that they could not find much to appreciate in any of the sections, with the exception, perhaps, of the engineering. It might be imagined that the authors of papers had become acquainted with the President's address, and endeavoured to be in accord with its spirit. Professor RÜCKER'S disquisition on "Atoms" was, apart from the mystery of the subject, enough to deter the "practical man" from the pursuit of science, for, as he explained, it is not of much consequence whether theories are built on fact or fiction, for they are only aids to memory like the figures which are introduced in celestial charts. From what was said about atoms, we seem to be nearing the time predicted by FARADAY when it shall be ascertained by our ultimate analysis that atoms are not particles, but infinitesimal amounts of force. Such a discovery would not, however, lead to immediate profit in a financial sense, but as force cannot be seen by human eyes, although they can perceive its operation, the atomic theory will then be regarded, as Dr. RÜCKER supposes, "as an attempt to give unnatural precision to ideas which are and must be vague."

Mathematical science has proved its utility in manufactures, but its truths were not evolved in the expectation that aid of that sort would be rendered. Not only in the theory of numbers, but in other parts the method has been more important than the immediate result. Men, however, occasionally arise who are capable of devoting themselves to a single branch of the science without asking *Cui bono?* and they should be encouraged. There is so close and irrefragable a connection between all sections of the science, we need not wonder at the undervaluing of specialists. Major MACMAHON, the president of the Mathematical Section, cannot be considered as one of the specialists, but he had the good sense to say that "What we require is not the disparagement of the specialist, but the stamping out of narrow-mindedness and of ignorance of the nature of the scientific spirit and of the life-work of those who devote their lives to scientific research. The specialist who wishes to accomplish work of the highest excellence must be learned in the resources of science and have constantly in mind its grandeur and its unity."

It is not uncommon to hear matured men declare that if they had to recommence life they would select chemistry as their profession in preference to all others. It not only can become as fascinating as any hobby without being so costly, for there is always the expectation during experiments of discovering secrets which nature had concealed—

Deep truths, to others unrevealed,
And mysteries from mankind sealed.

There is besides the possibility, and one not to be despised by a follower of science, that in the course of an investigation a process may be arrived at which will be

valuable in a commercial sense. Industrial chemistry often brings substantial rewards to its votaries. But from the address of Professor PERCY F. FRANKLAND it becomes evident that a large number of the younger chemists in England are less desirous of gain for themselves than for the increase of knowledge with gratitude "from that immortal part of us which we call posterity." As in mathematics, the State does little to reward chemical research, but when we find men willing to accept teacherships in polytechnical institutes and science schools in order to have occasional opportunities for investigation, it is evident the science is followed with the noblest aims. Indeed it would appear at the first glance as if Government support was fatal to chemistry. Professor FRANKLAND, as becomes a good chemist, is statistical. He has analysed the *Chemical Society's Journal*, and out of seventy-five original communications in one volume he finds that only thirteen came from Government laboratories and four from the "ancient seats of learning." In 1849 there were in all twenty-nine original communications to the Chemical Society; in 1900 the number rose to one hundred and twenty-seven. It is evident there is no lack of industry, and the difference must in a large measure be ascribed to the spirit which arose after the opening of new colleges, but not always immediately, for the desire to make chemistry subservient to trade was an obstacle to progress. Professor FRANKLAND says:—

That these new institutions should have so immediately borne fruit in the manner I have indicated cannot fail to be surprising to those who have been associated with the early years of almost any of these colleges, for when a faithful record of the experiences of their first professors is written the extraordinary obstacles which these pioneers had to encounter, and which in so many cases they successfully overcame, should afford material for a most remarkable, instructive and even amusing volume. The worthy founders and their executors or trustees appear in general to have supposed that it was only necessary to provide a spacious building, and then appoint a staff of professors who were to do the rest, whilst the necessity of funds for annual upkeep, for libraries and for assistants was almost overlooked.

It has indeed been learnt by bitter experience that the cost of efficiently maintaining institutions of this most ambitious character is enormously greater than was supposed in this country twenty-five years ago, and that founding a college, far from resembling the inauguration of a remunerative business, is very like entrance into the bond of matrimony, with its attendant annually increasing demand upon the pecuniary resources of the paterfamilias.

It would not indeed be surprising if some of these modern colleges had been long debarred from contributing directly to the progress of scientific investigation in this country, for this was often assuredly considered amongst the least of the many arduous duties imposed upon their first professors. Ascertained capacity to enrich science was in some cases almost a presumptive disqualification for their chairs, or, at any rate, took a back seat beside enthusiasm for evening classes and faith in the efficacy of that mysterious panacea "technical instruction." It is indeed lamentable to think of the valuable years of productive work lost to the country through so much of the energy of these early professors having been sacrificed to these venial fetishes of our would-be educational reformers.

Teaching occupies many hours a day of a chemical professor in a technical institute, yet, according to Professor FRANKLAND, many of those who hold appointments return to their laboratories with the ardour which other men find in rushing to the golf links, cricket field or race-course. The results of their researches are seldom of the kind which brings wealth, and can only be appreciated by men like themselves; still, on those conditions the number of workers continues to increase.

In the whole of Mr. HORNE'S address to the geological section there is not one reference to the industrial applications of the science. The subject treated is "Some of the permanent advances in the solid geology of Scotland during the last quarter of a century." The discoveries were mainly by officers of the Geological Survey, a body of men who labour for little more than a nominal salary. When the Survey was first constituted Sir H. T. DE LA BECHE, the director, announced that he engaged J. BEETE JUKES, "a very fine fellow, who loved knowledge for its own sake," at 9s. per diem, and, it was added, "he seems to care very little on what terms so that he comes." *Good, this.* After—

wards, when JUKES was offered the surveyorship of New South Wales, he preferred to remain on the English Survey rather than accept the far more lucrative colonial appointment. That is the spirit which is still dominant, and when gentlemen of high scientific attainments, for no others are tolerated on the Survey, are willing to work for a less salary than clerks, it cannot be said that geology is without self-sacrificing devotees.

Geography is less fortunate. Although so many travellers are produced in England who could criticise the shortcomings of maps from their own experience, the Germans excel us in map-making and in geographical knowledge. The science has failed to attract amateurs among us, and therefore it is in a backward state. Dr. MILL, as president of the Geographical Section, said that—

Amongst the not inconsiderable number of teachers of geography in the universities and colleges of Great Britain there is not one man who receives a salary on which he can live in decent comfort so as to devote all his time, or a substantial part of it, to geographical research; and the same is true of every official of all the geographical societies. Not one is paid an income sufficient to enable him to devote the time not occupied by mechanical routine to any other purpose than supplementing his income by outside work—writing text-books, correcting examination papers, perhaps even practising journalism. If by an effort and the sacrifice of some of the comforts considered necessary by most people of the professional classes he devotes a few odd hours now and then to some original research, he finds very few to consider it seriously; some friendly expressions of opinion possibly, but scarcely a reader; and it counts for nothing, save, perhaps, in enhancing the reputation of his country in other lands where scientific work, no matter in what department, is valued in a due degree. All this must be changed before much progress can be made. No doubt a giant of genius would ignore all obstacles and pursue his work regardless of recognition, but such giants are not to be looked for many times in a century. It should be made possible for a man of fair abilities to receive as much opportunity, encouragement, recognition and reward for good work in geography as for good work, let us say, in chemistry or electricity. That is all that can reasonably be asked, and that is what is freely accorded in other countries where the status of the man of science is higher than it is with us.

What can be done by geographers who do not claim to be professionals is shown by the effort of the late Mr. FRED PULLAR, in co-operation with Sir JOHN MURRAY, to make a survey, showing soundings, of the fresh-water lakes of the British Isles. Mr. LAURENCE PULLAR has made over a sufficient sum of money to enable the survey to be thoroughly carried out. The Ordnance Survey ought to supply the information, but the expense has been a prohibition.

Statistics cannot be universally recognised as science. There is an abundance of amateurs, but their work, we suppose, originated the statement about statistics being able to prove anything. Yet Sir ROBERT GIFFEN deplored at Glasgow the absence of statistical education among our public men.

The proper study of mankind was declared to be man, and anthropology permits the amateur to seize a position which is not possible with physiology. It is true that at Glasgow the president of the section, Dr. CUNNINGHAM, delivered an address which might have been prepared for the Physiological Section, as it dealt with the structure of the brain. But the papers relating to the discoveries in Crete, Silchester, &c., form evidence of what can be done by amateurs. Indeed, it is becoming difficult to discriminate between archæology and anthropology, but in both the non-professional student has his place, and can render useful service.

From what we have said it will, we trust, be evident that in science, as represented by the British Association for its advancement, there are two great divisions, which depend upon the character of the votaries. Those with whom engineering and mechanical science holds first place must differ in training and the pursuing of knowledge from students who gather and arrange statistics or ponder over the education problem. The Association has a place for all classes, from the man who spends the best years of his life in determining the qualities of a dye—like the chemist at one meeting who apologised for the prematureness of his paper because he had occupied only thirty years over one

colour—or one class of vegetation, to the humble devotee who records his or her observations in a railway cutting or a pond. The Glasgow meeting was a success in upholding science, although the papers were of a less popular character than many read at preceding meetings. By applying the Baconian test of "fruit" it should be considered as productive, and it demonstrated that the scientific power of the city was not exhausted by the various meetings which were held during the season.

MEMORIES OF THE LOUVRE.

A LITTLE paragraph appeared last week in some of the Paris journals which gave more satisfaction to lovers of French architecture and French history than all the columns which were devoted to the arrangements for the CZAR'S visit, or all the speculations as to whether His Majesty would be allowed to come to the capital. It simply stated that the Pavillon Marsan had been cleared of the heaps of documents accumulated by the Ministry of the Colonies, and that M. REDON, the architect, having obtained possession of the building, would be able to insure the safety of the Louvre at a point where there was a liability of danger through fire. The pavillon itself is not of much historical interest. It formed part of the Tuileries rather than of the Louvre, and it owes its name to a lady who was governess to the royal children.

The buildings of the Louvre which the pavillon menaced hold a place in the minds of Frenchmen unlike that of any group of buildings in Europe, with the exception perhaps of the Vatican. In the Louvre many kings have lived, but for several years it was tenanted also by so many varieties of artists as to become a true Bohemia. It has been stated in many English journals, which owing to the dearth of topics took up the life of BOULLE, that the furniture-maker stood so high in royal favour, he was assigned a part of the Louvre as if he were a prince. BOULLE, however, only shared the apartments with a miscellaneous company of tenants. The dervish who described the Persian palace as a caravanserai would be justified in applying the same term to the Louvre. But on that account it has been popularised, and the humblest Frenchman who gazes on the variety of statues adorning the exterior must feel a sense of proprietorship in the buildings. Since the memorial of the grocer's son, LÉON GAMBETTA, was set up the palace has been, if possible, brought nearer to the people, for the imperial additions appear to be only a frame for the figure of the eloquent but briefless lawyer.

In fact, whatever kind of associations is most in keeping with a visitor's mind can be aroused in some part of the building. The modern painter can recall that the early Salons were in the Louvre. A part of the beautiful Apollo Gallery was given up to art students, and before they were able to hire ateliers they were allowed to produce works in the palace. The Académie des Inscriptions and the Académie des Sciences were quartered in the Louvre, and during a part of the eighteenth century the public assemblies of the Académie Française were held in one of the galleries. When the Académie d'Architecture existed the members had to be content with a few of the worst rooms. Another gallery was devoted to models of ships. The sculptors were able to obtain possession of some of the finest rooms on the ground floor. BOUCHARDON, ADAM, PUGET, LE FLAMAND, SLODZ, FALCONET, LE MOYNE were among the fortunate artists who secured ateliers as well as stores for their marble. The painters were more easily accommodated, for they required less space. Their academy was to be found in the Louvre. BOUCHER, COYPEL, VAN LOO and many more were granted local habitations in it without any cost to themselves.

The artists who were engaged on various works connected with the palace comprised the ablest native and foreign painters, sculptors and architects. It is believed that in the thirteenth century ROBERT DE LUZARCHES, PIERRE DE MONTEREAU, THOMAS DE CARMONT, Eudes DE MONTREUIL, JEAN DE CHELLES and ETIENNE DE BOUNVILLE, all memorable in the history of Gothic architecture, co-operated in the works of the Louvre. In the next century RAIMOND DU TEMPLE was master of the works for the additions ordered by CHARLES V. The names

of several contemporary painters and sculptors are also recorded. It must have been a halcyon time for artists, for the king, who was an able amateur, found pleasure in their company.

Less than two centuries afterwards another lover of the arts reigned in France. FRANCIS I. was not satisfied with the rebuilding of Fontainebleau. He resolved to enlarge and embellish the Louvre. How many of the army of artists he brought from Italy worked on the Paris buildings cannot be determined. According to DU CERCEAU, the king was dissatisfied with the plainness of the interior, and he despatched PRIMATICCIO to Italy to purchase works of art. It is related that the artist was able to secure 124 antique statues, besides several busts. Some of them still remain in the galleries. A casting was made in metal of Trajan's Column, which, we suppose, was intended to be erected in one of the courts; it has long disappeared. PHILIBERT DE LORME and LESCOT were the architects who were charged with the demolition of all the parts of the old Louvre which were considered inadequate, and the erection of more suitable buildings. JEAN GOUJON was among the sculptors who adorned the new works. According to the legend, while engaged he was shot, but there is no satisfactory evidence of the murder, although many innocent men were undoubtedly slain on St. Bartholomew's Day.

HENRI IV. was eager to endear himself to the people among whom he was to reside. He proposed the construction of a grand gallery by the side of the Seine which would unite the Louvre and the Tuileries, as well as other important works. The commission was given to a brother Huguenot, ANDROUET DU CERCEAU. The architect for some unknown reason left France in 1598, and he was succeeded by ETIENNE DU PERAC, who does not appear to have long held his appointment. Another architect engaged was CLEMENT MÉTÉZEAU. HENRI IV. was able to complete the Palace of the Tuileries, which CATHERINE DE MEDICIS had commenced from the plans of PHILIBERT DE LORME and JEAN BULLANT, and he inscribed over the entrance the following words:—"Perennitati invictissimi principis de bello et pace triumphantis." HENRI IV. merits remembrance not only for his courage, tolerance and other kingly virtues, but for setting the example of sharing his palace with painters, sculptors, goldsmiths and jewellers, to whom the Louvre became a school of art, and a reward for distinguished merit in art. In the next reign it was RICHELIEU who was master of France. An equestrian statue of HENRI IV. was erected, and, according to HÉNAULT, it was the first of that class to be set up in Paris. The works at the Louvre were resumed under the direction of JACQUES LE MERCIER, and he proposed to make it four times as large as was shown on LESCOT's design, but so ambitious a scheme was not realised.

When LOUIS XIV. came to the throne his ambitious mind found a congenial subject in the unfinished buildings. LE VAU was appointed successor to LE MERCIER, but it is needless to say that he did not respect the designs of his predecessor or LESCOT's. COLBERT, who at all costs wished to have the king gratified, was not satisfied with any existing plan, and a competition was arranged, in which Dr. CLAUDE PERRAULT succeeded in pleasing the King and his Minister. Then the plans were sent to Rome, but the contempt with which they were received annoyed LOUIS, and the skill of BERNINI was invoked. The sculptor came to France, where he was received like a prince. But the witticisms of Paris were not compensated by a triumphal march, and he left in disgust with a liberal pension for a viaticum. BOILEAU's wicked doctor was recalled, and the works went on under his direction. But before the buildings were complete COLBERT and PERRAULT passed away. LOUIS was captivated with the project of a palace at Versailles, and so little respect was shown to the Louvre that a house for the ducal superintendent was built against PERRAULT's colonnade, and for others sites were found within as well as without the walls. When LOUIS XV. succeeded it was gravely proposed by the Ministers to demolish the palace in order to save useless expenditure, and to sell the materials.

In the middle of the eighteenth century the appearance of the Louvre would have startled any of its ancient architects

and decorators. Shops were opened in various parts, and in the fine columns holes were made to fix the wood-work. The Parisians protested against the vandalism. TURGOT proposed to purchase the buildings on condition that the part near the Seine, which was without a roof, should be converted into a hôtel de ville. The governor of the city and some of the ministers at length were able to have the works resumed. The Marquis DE MARIGNY was appointed director-general of buildings, and under him GABRIEL and SOUFFLOT served as architects. But there were so many plans partly executed, it was difficult to determine what should be done with the unfinished buildings, and the resignation of the marquis was turned to account for suspending the works.

There was consequently a legacy in the Louvre awaiting the unfortunate LOUIS XVI., which on a small scale corresponded with the whole of France. If money were forthcoming the buildings might be completed, but no director-general could discover it. There were always people ready to pounce on the vacant chambers, and they became private residences, ateliers, &c.

It was remarkable that amidst so much degradation the connection between the Louvre and the arts was not altogether ignored. It was proposed to convert the largest gallery into a musée of painting and sculpture. In 1781 the Apollo Gallery was restored, and when the revolutionary army carried off the noblest examples of art to be found in Italy, they were exhibited in the appartements which had been occupied by ANNE of Austria.

In 1800 an additional number of rooms were put in order for the exhibition of spoils from various parts of Europe. Under the Empire PERCIER and FONTAINE became the architects, and it was decreed that the buildings should be completed. NAPOLEON decided that the work already existing should be respected. Three of the façades were to be completed according to PERRAULT's designs and the fourth according to LESCOT's, but the arrangement could not be accomplished. Between 1800 and 1806 the outlay had been about 600,000 francs yearly, but it was decreed that afterwards the expenses were to be debited to the civil list. Whatever was the cost, the uncertainty of the distribution of the rooms was not easily overcome. New requirements had to be met. Models were prepared to facilitate a decision, and NAPOLEON must often have been irritated by the difficulties which arose. In 1810 no less than forty-seven plans were discussed for the connection of the Louvre and the Tuileries. On the fall of NAPOLEON the colossal work had not come to an end, although the efforts made during his reign were most praiseworthy, and the warrior had proved his possession of the ancient regal belief that architecture was the most fitting memorial of a reign.

At the restoration there was a continuation of the works, but they were mainly of a decorative class. The acquisition of works of art also engaged the attention of the Government. There was not, however, sufficient courage to devote the whole of the buildings to public galleries. The ceremony of opening the Chambers was performed in the Grand Salle. The Council of State obtained possession of several large rooms which were decorated with appropriate paintings. It was often an advantage to have ministers and councillors near the Tuileries, and the Louvre accordingly became the region of the highest officialdom of France. That arrangement was also the least expensive, and under LOUIS XVIII., CHARLES X. and LOUIS PHILIPPE there were no extraordinary votes for building at the Louvre.

The Third NAPOLEON was not neglectful of the opportunity which the inequality of the buildings afforded to revive the efforts which his uncle had commenced. Unlike him he did not propose to make them all serve as a sacred city to be consecrated to art and literature. NAPOLEON I. wished to have the Opera House and the Bibliothèque Nationale transferred to it, but the conditions of the new reign did not allow of a revival of projects which seemed to be inspired by Mediæval Italy rather than modern France. Under VISCONTI, who was a son of the First NAPOLEON's conservateur des antiques, buildings were erected in a style so grandiose as to eclipse those of an older date which are near them. The destruction of the Tuileries, however, has changed the character of the grouping, and few now care to

realise what was the aim of so many architects and kings when they endeavoured to bring the great blocks of buildings which seem to unite past and present into architectural unity, an aim which would support those etymologists who maintain that Louvre signifies *l'œuvre*, the greatest work in France.

STUDY OF MATHEMATICS IN ENGLAND.*

IT is interesting, in this the first year of the new century, to take a rapid glance at the position that mathematicians of this country held amongst mathematicians a hundred years ago. During the greater part of the eighteenth century the study of mathematics in England, Scotland and Ireland had been at a very low ebb. Whereas in 1801 on the Continent there were the leaders Lagrange, Laplace and Legendre, and of rising men, Fourier, Ampère, Poisson and Gauss, we could only claim Thomas Young and Ivory as men who were doing notable work in research. Amongst schoolboys of various ages we note Fresnel, Bessel, Cauchy, Chasles, Lamé, Möbius, v. Staudt and Steiner on the Continent, and Babbage, Peacock, John Herschel, Henry Parr Hamilton and George Green in this country. It was not indeed till about 1845 or a little later that we could point to the great names of William Rowan Hamilton, MacCullagh, Adams, Boole, Salmon, Stokes, Sylvester, Cayley, William Thomson, H. J. S. Smith and Clerk Maxwell as adequate representatives of mathematical science. It is worthy of note that this date, 1845, marks also the year of the dissolution of a very interesting society, the Mathematical Society of Spitalfields; and I would like to pause a moment and, if I may say so, rescue it from the oblivion which seems to threaten it. In 1801 it was already a venerable institution, having been founded by Joseph Middleton, a writer of mathematical text-books, in 1717.[†] The members of the society at the beginning were for the most part silk-weavers of French extraction; it was little more than a working-man's club at which questions of mathematics and natural philosophy were discussed every Saturday evening. The number of members was limited to the "square of seven," but later it was increased to the "square of eight," and later still to the "square of nine." In 1725 the place of meeting was changed from the Monmouth's Head to the White Horse in Wheeler Street, and in 1735 to the Ben Jonson's Head in Pelham Street. The subscription was six-and-sixpence a quarter, or sixpence a week, and entrance was gained by production of a metal ticket which had the proposition of Pythagoras engraved on one side and a sighted quadrant with level on the other. The funds, largely augmented by an elaborate system of fines, were chiefly used for the purchase of books and philosophical apparatus. A president, treasurer, inspector of instruments and secretary were appointed annually, and there were, besides, four stewards, six auditors and six trustees. By the constitution of the Society it was the duty of every member, if he were asked any mathematical or philosophical question by another member, to instruct him to the best of his ability. It was the custom for each member in rotation to lecture or perform experiments on each evening of meeting. There was a fine of half a crown for introducing controverted points of divinity or politics. The members dined together twice annually, viz. on the second Friday in January in London in commemoration of the birth of Sir Isaac Newton (this feast frequently took place at the Black Swan, Brown's Lane, Spitalfields), and on the second Friday in July "at a convenient distance in the country in commemoration of the birth of the founder." The second dinner frequently fell through because the members could not agree as to the locality. It was found necessary to introduce a rule fining members sixpence for letting off fireworks in the place of meeting. Every member present was entitled to a pint of beer at the common expense, and, further, every five members were entitled to call for a quart for consumption at the meeting. Such were some of the quaint regulations in force when, about the year 1750, the Society moved to larger apartments in Crispin Street, where it remained without interruption till 1843. It appears from the old minute books that about the year 1750 the Society absorbed a small mathematical society which used to meet at the Black Swan, Brown's Lane, above mentioned, and that in 1783 an ancient historical society was also incorporated with it. By the year 1800 the class of the members had become improved, and we find some well-known names, such as Dolland, Simpson, Saunderson, Crossley, Paroissen and Gompertz. At this time lectures were given in all branches of science by the members in the

Society's rooms, which on these occasions were open to the public on payment of one shilling. The arrangements for the session 1822-23, included lectures in mechanics, hydrostatics and hydraulics, pneumatics, optics, astronomy, chemistry, electricity, galvanism, magnetism and botany, illustrated by experiments. On account of these lectures the Society had to fight an action-at-law, and although the case was won, its slender resources were crippled for many years. In 1827 Benjamin Gompertz, F.R.S., succeeded to the presidency on the death of the Rev. George Paroissen. From the year 1830 onwards the membership gradually declined, and the financial outlook became serious. In 1843 there was a crisis; the Society left Crispin Street for cheaper rooms at 9 Devonshire Street, Bishopsgate Street, and finally in 1845, after a futile negotiation with the London Institution, it was taken over by the Royal Astronomical Society, which had been founded in 1821. The library and documents were accepted, and the few surviving members were made life members of the Astronomical Society without payment. So perished this curious old institution; it had amassed a really valuable library, containing books on all branches of science. The Astronomical Society has retained the greater part, but some have found their way to the libraries of the Chemical and other societies. An inspection of the documents establishes that it was mainly a society devoted to physics, chemistry and natural history. It had an extensive museum of curiosities and specimens of natural history presented by individual members, which seems to have disappeared when the rooms in Crispin Street were vacated. It seems a pity that more effort was not made to keep the old institution alive. The fact is that at that date the Royal Society had no sympathy with special societies, and did all in its power to discourage them. The Astronomical Society was only formed in 1821 in the teeth of the opposition of the Royal Society.

Reverting now to the date 1845, it may be said that from this period to 1866 much good work emanated from this country, but no Mathematical Society existed in London. At the latter date the present Society was formed, with De Morgan as its first president. Gompertz was an original member, and the only person who belonged to both the old and new societies. The thirty-three volumes of proceedings that have appeared give a fair indication of the nature of the mathematical work that has issued from the pens of our countrymen. All will admit that it is the duty of anyone engaged in a particular line of research to keep himself abreast of discoveries, inventions, methods and ideas which are being brought forward in that line in his own and other countries. In pure science this is easier of accomplishment by the individual worker than in the case of applied science. In pure mathematics the stately edifice of the Theory of Functions has, during the latter part of the century which has expired, been slowly rising from its foundations on the Continent of Europe. It had reached a considerable height and presented an imposing appearance before it attracted more than superficial notice in this country and in America. It is satisfactory to note that during recent years much of the leeway has been made up. English-speaking mathematicians have introduced the first notions into elementary text-books; they have written advanced treatises on the whole subject; they have encouraged the younger men to attend courses of lectures in foreign universities, so that to-day the best students in our universities can attend courses at home given by competent persons, and have the opportunity of acquiring adequate knowledge, and of themselves contributing to the general advance. The Theory of Functions, being concerned with the functions that satisfy differential equations, has attracted particularly the attention of those whose bent seemed to be towards applied mathematics and mathematical physics, and there is no doubt, in analogy with the work of Poincaré in celestial dynamics, those sciences will ultimately derive great benefit from the new study. If, on the other hand, one were asked to specify a department of pure mathematics which has been treated somewhat coldly in this country during the last quarter of the last century, one could point to geometry in general, and to pure geometry, descriptive geometry and the theory of surfaces in particular. This may doubtless be explained by the circumstance that, at the present time, the theory of differential equations and the problems that present themselves in their discussion are of such commanding importance from the point of view of the general advance of mathematical science that those subjects naturally prove to be most attractive.

As regards organisation and co operation in mathematics, Germany, I believe, stands first. The custom of offering prizes for the solutions of definite problems which are necessary to the general advance obtains more in Germany and in France than here, where, I believe, the Adams Prize stands alone. The idea has an indirect value in pointing out some of the more pressing desiderata to young and enthusiastic students, and a direct importance in frequently, as it proves, producing remarkable dissertations on the proposed questions. The field is so vast that any comprehensive scheme of co-operation is

* From the address to the Mathematical and Physical Section of the British Association by Major P. A. MacMahon, D.Sc., F.R.S.

† Its first place of meeting was the Monmouth's Head, Monmouth Street, Spitalfields. This street has long disappeared. From a map of London of 1746 it appears to have run parallel to the present Brick Lane and to have corresponded to the present Wilks Street.

scarcely possible, though much more might be done with advantage.

It is, I think, undoubted that science has been neglected in this country, and that we are reaping as we have sowed. The importance of science teaching in secondary schools has been overlooked. Those concerned in our industries have not seen the advantage of treating their workshops and manufacturing as laboratories of research. The Government has given too meagre an endowment to scientific institutions, and has failed to adequately encourage scientific men and to attract a satisfactory quota of the best intellects of the country to the study of science. Moreover, private benefactors have not been as numerous as in some other countries in respect of those departments of scientific work which are either non-utilitarian or not immediately or obviously so. We have been lacking alike in science organisation and in effective co-operation in work.

It has been attempted to overcome defects in training for scientific pursuits by the construction of royal roads to scientific knowledge. Engineering students have been urged to forego the study of Euclid, and, as a substitute, to practise drawing triangles and squares; it has been pointed out to them that mathematical study has but one object, viz. the practical carrying out of mathematical operations; that a collection of mathematical rules of thumb is what they should aim at; that a knowledge of the meaning of processes may be left out of account so long as a sufficient grasp of the application of the resulting rules is acquired. In particular, it has been stated that the study of the fundamental principles of the infinitesimal calculus may be profitably deferred indefinitely so long as the student is able to differentiate and integrate a few of the simplest functions that are met with in pure and applied physics. The advocates of these views are, to my mind, urging a process of "cramming" for the work of life which compares unfavourably with that adopted by the so-called "crammers;" for examinations; the latter I believe to be, as a rule, much maligned individuals, who succeed by good organisation, hard work and personal influence, where the majority of public and private schools fail; the examinations for which their students compete encourage them to teach their pupils to think, and not to rely principally upon remembering rules. The best objects of education, I believe, are the habits of thought and observation, the teaching of how to think, and the cultivation of the memory, and examiners of experience are able to a considerable extent to influence the teaching in these respects; they show the teachers the direction in which they should look for success. The result has been that the "crammer" for examinations, if he ever existed, has disappeared. But what can be said for the principle of cramming for the work of one's life? Here an examination would be no check, for examiners imbued with the same notion would be a necessary part of the system; the awakening of the student would come, perhaps slowly, but none the less inevitably; he might exist for awhile on his formulæ and his methods, but with the march of events, resulting in new ideas, new apparatus, new designs, new inventions, new materials requiring the utmost development of the powers of the mind, he will certainly find himself hopelessly at sea and in constant danger of discovering that he is not alone in thinking himself an impostor. And an impostor he will be if he does not by his own assiduity cancel the pernicious effects of the system upon which he has been educated. I do not, I repeat, believe in royal roads, though I appreciate the advantage of easy coaches in kindred sciences. In the science to which a man expects to devote his life, the progress of which he hopes to further, and in which he looks for his life's success, there is no royal road. The neglect of science is not to be remedied by any method so repugnant to the scientific spirit; we must take the greater, knowing that it includes the less, not the less, hoping that in some happy-go-lucky way the greater will follow.

EXPLORATIONS AT ZAKRO.

IN a paper read before the British Association Mr. D. G. Hogarth, M.A., wrote:—The excavation at Zakro in East Crete has been concluded so recently that I must confine myself to a plain statement of the raw material rendered available for study thereby. In estimating the final result it will be necessary to take account of positive and negative evidence not yet to hand from two other East Cretan sites lately excavated, Praesos and Gorynia. Zakro lies in the south-eastern angle of the island, and was chosen for research because it falls in the Eteocretan country, anciently reputed to be inhabited by aborigines, and because its safe bay must always have been a main port of call for craft sailing between the Aegean coasts and Africa. The small plain of Zakro, entirely hemmed in by rugged hills, is full of early remains, beginning in the later pre-Mycenæan period and ending with the close of the age of bronze. No implements of iron were found in it at all and no Hellenic pottery. The town therefore

owed its existence to a commerce which ceased or passed elsewhere from the Geometric age onward. The earliest settlement was on a rugged spur, and although almost all trace of its structures have disappeared, it has left abundant evidence of itself in the contents of a pit about 18 feet deep. This was found half-full of broken vases in stone and clay, largely of the singular "Kamâres" class, not previously found in Eastern Crete. These, however, are mainly of a highly developed technique, and their commonest schemes of ornament reappear unchanged on vases of distinctively Mycenæan fabric. In fact, Kamâres shapes and decoration are more closely related to Mycenæan at Zakro than had been suspected. But the absence of both Neolithic antecedents and the earlier kinds of painted ware from this site suggests that its civilisation did not develop on the spot, but was brought by colonists, perhaps partly Cretan, partly foreign. The fine quality of ware in this pit and the fact that, though of various periods, it was apparently all thrown in at one moment leads me to suspect that the pit contained the clearings of an early shrine.

At a later period the settlement extended over a lower spur nearer the sea, and there very massive and large houses were erected and inhabited till the verge of the Geometric period. Their outer walls are cyclopean, but their inner partitions are of bricks of unusual size. Complete plans were obtained of two of the largest houses, and parts of several others were explored, including the lower portion of what was probably the residence of the local chief or governor. These yielded a great deal of pottery, ranging from the acme of the Mycenæan period to its close, and the types furnish a better criterion of date than we have possessed hitherto in Crete. Numerous bronze implements were found, but these yield in interest to those from Gorynia. Two tablets in the linear "Cretan" script show that this system was known, though probably little used, and not indigenous, in East Crete. None were found couched in the pictographic system so often represented on East Cretan gems. Finally a hoard of 500 clay impressions of lost signet gems was brought to light. These display 150 different types and afford a priceless record of Mycenæan glyptic art and religious symbolism. Monstrous combinations of human and bestial forms occur in great variety, half a dozen, which are bull-headed, suggesting varieties of the Minotaur type. The comparison of all this mass of new material with the symbols of Egyptian, Mesopotamian and other cults, which cannot fail to be fruitful, has yet to be made. Cist burials were discovered in caves further inland, whose grave furniture seems to support certain negative evidence obtained in the Upper Zakro district and at Praesos, in showing that the aboriginal civilisation of East Crete was independent of both the "Kamâres" and Mycenæan civilisations. If these last were foreign to the Eteocretan country, it seems improbable that the Eteocretan language, as represented by the Praesos inscriptions, will prove to be that expressed by the linear script on the Knossian tablets, and the hope that these will be deciphered becomes fainter.

THE CHURCH OF ST. MARY, PULHAM.*

THERE is a certain amount of local evidence that there was Roman influence in this place. I am told that Roman coins have been dug up in a neighbouring field, and from time to time we unearth in the northern part of the churchyard pieces of pottery, which the late Canon Manning thought, from a cursory examination, might be British or Roman. At any rate they are evidence that our graveyard dates back to pre-Christian times, while there are a few bricks in the northern part of the church wall which experts would decide whether or no they are Roman. We are near enough—two miles—to the great Roman road from Colchester to Caister to be influenced by it. Blomefield tells us that in early times this manor belonged to one Waldchrist, a Saxon; that he forfeited it to King Edmund, from whom it passed as a royal possession to his brothers, Eldred and Edgar, who succeeded him as kings. In the time of King Edgar (958-75) lived Ethelwold, the great Bishop of Winchester, a pupil of St. Dunstan. This Ethelwold was keen on restoring religious houses devastated by the Danes, and especially that of St. Etheldreda at Ely. He therefore purchased the Isle of Ely from King Edgar, and among other manors thus of Pulham, for which he paid the king 40*l*. He made this property over to monks of Ely, and the church, advowson and manor remained a portion of St. Audrey's dower for nearly 700 years. This explains the presence of the arms of Ely (three crowns) being conspicuous on the porch and in more recent adornment. Pulham had to provide three days' supplies per annum to the monks of Ely. In her first year Queen Elizabeth practically stole Pulham from Ely, together with thirteen other manors, during the episcopate of Bishop Cox, and it remained in the

* From a paper read by the Rev. C. C. Wakefield, the rector, at the visit of the Norfolk and Norwich Archaeological Society.

hands of the Crown till 1631, when the manor was sold by Charles I. to certain London merchants to pay his son's debts, the advowson alone being retained. Our largest land-owners are now the trustees of Christ's Hospital. In 1244 it appears that there was a weekly market on Wednesdays, evidently at what is now Pulham Market. This market was ultimately removed to Harleston, but a trace of it remains in a fair which is still held at Whitsuntide. How long there have been two parishes of Pulham I cannot say. In 1250 St. Mary Magdalen is spoken of as a parish annexed. The two parishes were held together until 1858, the rectory house being in the mother parish. Since then each parish has properly had its own rector. Considering the high position held at the time, or, subsequently, by some of its rectors, Pulham must have been considered a benefice of some importance.

The first rector known was Henry de Wengham, appointed in 1257 Bishop of London. In the previous year he had refused Winchester, and was Lord Chancellor of England and Chamberlain of Gascoigne. In 1301 came Simon de Walpole, brother to Ralph de Walpole, Bishop of Ely, and before that Bishop of Norwich. In 1341 came Michael de Northburgh, who was consecrated Bishop of London in 1354. In 1357 was appointed William of Wykeham, who in time became Bishop of Winchester, Chancellor of England, the builder of Windsor Castle and the founder of Winchester College and of New College, Oxford. He resigned in 1361. He was never rector of Pulham as a priest, for it was only in the year of his resignation that he was ordained acolyte, between which and the priesthood came the lesser orders of sub-deacon and deacon. Whether Wykeham designed our beautiful south porch, as tradition affirms, I leave experts to judge. He might have done it for his successor and friend, Andrew de Stratford, for whom he obtained the benefice from the king, and who held it for twenty-three years. In 1465 the rector was Thomas Howes, who had been chaplain to Sir John Fastolf, and in accordance with whose will he spent much money on this church, inserting stained-glass windows, and, perhaps, building the tower. Much was done to the church in the time of John Morton, Bishop of Ely, in 1479, and afterwards Archbishop of Canterbury and Cardinal. He is said to have been connected with the parish by birth or family. Other rectors were Andrew Perne, D.D., in 1550, Dean of Ely, Master of Peterhouse, and afterwards chaplain to Archbishop Parker; Henry May, sometime Dean of St. Paul's and afterwards Chancellor of Ely; William Starkey, jun., buried in the chancel under a slab—his first wife was granddaughter of Bishop Hall, of Norwich. Wm. Broome, LL.D., was rector 1728-47. He was a great friend of the poet Pope, and wrote much of the poetry attributed to the latter, especially Books 8, 11, 12, 16, 18 and 23 of the Odyssey. The tradition is that Pope was often here the guest of Broome, and used to sit writing under the ancient mulberry tree still standing in the rectory garden. William Clagett, bishop successively of St. Davids and Exeter, was rector here in 1717, and the Hon. Edward Townshend, Dean of Norwich, in 1749.

The church speaks architecturally for itself, and better than I can describe it. It contains an almost complete sequence of the various styles of architecture, beginning with the Norman aumbry on the north side of the sanctuary, and continuing with the somewhat rare instance of so early a double piscina. Then follow the lancet windows in the north of the chancel, and so on until we come to the late Perpendicular window, with transoms, in the nave—a later insertion. The indented slab before the altar is to the memory of Simon de Walpole, rector in 1301. The beautiful panels in the screen were painted over with three coats of paint in 1804, at which time the chancel arch was filled in, as also the lower arches of the screen, in which act of vandalism was spent some 30*l*. The screen was recently restored in memory of Archbishop Trench, of Dublin. The window nearest the screen on the north side of the nave is, I am told, a valuable one, as showing the transition from Decorated to Perpendicular work. The stone altar slab still remains embedded in the floor at the east end of the south aisle, and two crosses are visible. I am anxious that it should be raised from its present unworthy position, and be again used as a side altar. The holy-water stoup in the porch always seemed to me to be unworthy of so beautiful an erection, until I obtained from the Augmentation Office an inventory of church furniture existing here in 6 Edward VI., when it appears that there was a stoup of bell metal inserted in the wall. On the north side of the church outside are remains of very early arcade work, probably from an older building. The north side door—devil's door—common to all East Anglian churches, is fifteenth-century, and from its marks of carpenters' tools and wheels was probably presented by a guild of wheelwrights. Where the vestry now stands was formerly the guild chapel of St. James the Apostle. Until discovered at the late restoration, the lancet windows and south door were built up and forgotten. The Guildhall stood in the field adjoining the churchyard on the north, and until early in the nineteenth

century was the parish playground, or "camping" field. In 1814 it was purchased by the then rector, and added to the glebe. Old people in the parish have told me he objected to the use of the field for the game of "camp" on Sundays. At the north end of the church, under the east window, is the tomb of Mrs. Watt, daughter and sole heiress of the notorious William Dowsing, the spoliator, who is said to be buried in Pulham Market. At the east end of the south aisle are to be seen remains of the consecration crosses or marks.

PETERBOROUGH CATHEDRAL.

THE restoration of the central gable of the west front of Peterborough Cathedral is now being proceeded with. It will complete the work over which there was so much controversy when the late Dean Ingram took it in hand. It has not been found necessary to take the gable down as was the case with the north and south gables. Auxiliary scaffolding has been erected right up to the great cross, by which means the huge statue of St. Peter, which for nearly eight centuries has overlooked the city, can be critically examined. It is in wonderful preservation, the right hand merely being missing. The outer label of the great arch is much withered, as are various fittings of Alwalton marble, all of which will be renewed. A radical restoration will have to be carried out also in the spokes of the great wheel window. On the whole, though there will have to be several renewals both of the inner and outer masonry, the central arch does not exhibit anything like the weakness which marked the sister arcading and gables, which, it may be remembered, were taken down and rebuilt stone by stone. The work has been entrusted to Messrs. John Thompson & Co.

THE NATIONAL PHYSICAL LABORATORY.

PLANS of the new institution now being erected at Bushey were exhibited to the members of the British Association by Dr. Glazebrook, the superintendent of the National Physical Laboratory, who gave a short history of the building, and described the objects with which it has been founded. The main building consisted of a substantial central block about 70 feet square standing on a vaulted basement. At each corner there was a large wing practically single-storeyed; the rooms in these were being fitted up for various special purposes. In the central building itself would be two general laboratories. There would be a large entrance-hall arranged as an apparatus room, and a library. The basement contained six rooms of fair size; the floor had been covered with a thick layer of concrete. The walls were very thick, so that they were extremely steady, and the temperature and conditions all favourable for steady work. In addition there were other smaller rooms on the basement; two of these were entirely surrounded by thick interior walls and arrangements would be fitted to maintain a steady temperature throughout the year. At the back was another wing containing a number of rooms suited for special researches, and there a lift had been fitted and also a mercury column having a height of about 50 feet. For the more delicate physical work the ground floor and basement of the old house afforded ample accommodation. For the engineering work a room, 80 feet by 50 feet, had been built, lighted from the north by a weaving shed roof. It was divided longitudinally into two bays by a series of rolled steel pillars. The one bay would contain a light travelling crane; along the other ran a line of shafting for driving the machinery and for experimental purposes. Adjoining this laboratory was a drawing office, while the engine-house and boiler-rooms were close at hand. Power obtained from a 60-kilowatt Parsons turbine would be distributed electrically to various parts of the laboratories; this form of engine was chosen for the express purpose of avoiding vibration as far as possible. The necessary tools were on order and in course of installation. The work which the committee hoped to attack in the first instance was that which had already been under the consideration of the alloys research committee of the Mechanical Engineers. Apparatus for the photo-micrographic examination of steel rails was being set up, and machines for testing the elastic properties of alloys were in course of construction. Pressure gauges and steam indicators would also be tested. The height of the building would not allow the mercury column, now being erected, to measure more than 200 lbs. to the square inch, but apparatus was being constructed for pressure in excess of that amount. Considerable attention was to be given to high temperature thermometry, the testing of platinum thermometers and the measurement of electrical quantities. Before the end of the year the committee hoped the laboratory would be fully and usefully occupied. Acknowledgment was made of the generosity of Sir Andrew Noble, who had given an excellent comparator, a dividing engine and some measuring apparatus of the highest class to the laboratory.

NOTES AND COMMENTS.

THE riverside buildings in Cologne are not all picturesque, and from some points of view the appearance of the city is, in consequence, unsatisfactory. It is also found that the full effect of the Cathedral, of which all are proud, is not everywhere manifest. It was lately decided to invite German architects to compete in the design of a building which the judges would consider as typical of what is required on sites near the Rhine. No less than 119 designs were sent in. The first prize has been awarded to Herr KARL ROTH, of Darmstadt, who suggests the late German Renaissance style as most suitable. The second prize was gained by the Brothers SCHAUPMEYER, of Cologne, who have combined the characteristics of more than one Renaissance period. Supplementary prizes were given to Herren THYRIOT, of Cologne; SCHMITZ & WIRTZ, of Trier; and WIGGERT, of Breslau. Herr PFLAUME, of Cologne, and Herr WEIMANN, of Duisburg, were awarded third prizes. The gainers of fourth prizes were Herren KUSTER, of Cologne; SCHUTTE, of Barmen; and KREMER, of Frankfurt. Taken as a whole free Renaissance was considered to be most eligible, but in some designs Gothic was utilised.

It is fortunate for Scotland that the difficulty about secondary schools which now disturbs educationists is there unknown, for when the system was first established there was no doling of knowledge. According to Mr. ADAMS, "public school" means in Scotland any school, whether primary or secondary, that is under the management of a School Board. By the Education (Scotland) Act, 1872, eleven schools were scheduled as higher class public schools. There are now thirty such schools, all of them placed entirely under the control of School Boards, "with a view to promote the higher education of the country." The fundamental difference between these and all the other public schools of Scotland is that the higher class schools are debarred from earning the annual Parliamentary grant. All the other public schools are usually referred to as "grant-earning." Voluntary schools are also grant-earning, since they receive all the grants of the ordinary public schools, with the addition of an annual grant of 3s. per pupil in average attendance. The higher class public schools are supported by contributions from the municipal authorities of the district, according to ancient custom, by certain endowments varying with each case, by fees and by the rates. If need be the School Board may charge all the expenses of a higher class school on the rates, except the salaries of teachers. The Board has great freedom in dealing with the higher class schools. It determines the qualifications to be demanded from the teachers, and has the power of causing candidates for the post of teacher to be examined. This power is rarely, if ever exercised. The qualification demanded is usually the possession of a university degree. These schools are examined annually by examiners appointed by the Board. As to the subjects studied, however, there is no rigid line marking off the grant-earning schools from the others. The tradition of the Scottish parish school is that each school is fit to prepare a lad to go direct from school to university, and in the north-east of Scotland—thanks to the DICK and MILNE bequests—the tradition is justified to this day.

THE horse-trough in Verona, which used to be shown as the sarcophagus of JULIET, was enough to take all the poetry out of SHAKESPEARE'S tragedy, for in Italy something which is beautiful is expected to be associated with a heroine. But the people who were shocked in Verona were satisfied when a big stone was pointed out to them at Helsingfors, on which the words "HAMLET'S GRAVE" were inscribed. That HAMLET was slain by LAERTES at Elsinore was recorded in the tragedy, and it was not difficult to imagine he was also buried there. Vague notions about rude stone monuments arose in visitors' minds, and it was not asked how long the stone had been supposed to be one of the most interesting of memorials. Care was taken of late years to prevent the removal of chip-pings, but several other stones were available for that purpose, and it was easy to suppose that, although they bore no inscription, they once formed part of the monument. The stone was not recognised as marking HAMLET'S grave until

modern times, and was, it is believed, dignified with that office in order to make a suburb of Helsingfors attractive to a class of visitors who are supposed to spend money freely. The local authorities have at last disclaimed all connection with the deception, and it is believed that those who have profited by the stone will try the experiment of removing it to another position.

At the Russian Imperial stone-polishing works of Jekaterinburg, in the Ural Mountains, a sarcophagus is now in preparation which has a tragic interest. It is made of the finest green jasper that can be procured in the territory. The sarcophagus is to be placed in the Atonement Church of St. Petersburg, and will contain the paving-stones on which ALEXANDER II. fell when he was assassinated on March 13, 1881. The stones are stained with the blood of the CZAR who abolished serfdom throughout his Empire. The church was commenced soon afterwards, and it is expected to be completed next year. The style is Russian. It will have a high bell-tower, besides six cupolas.

THE Brighton Town Council, having acquired possession of the Aquarium, propose to borrow 25,000*l.* to be expended in works that are almost equal to a rebuilding of the premises. For some time past the buildings have presented that poverty-stricken appearance which betokens the unsuccessful place of entertainment, especially at sea-side resorts. Now that the Aquarium is the property of the Corporation, they must assume a different character. It is agreed that the following works shall be undertaken, viz. the reconstruction of the concert-room; the reconstruction of the fernery and waterfall; the renewal of the roof; renewing ventilation and warming, and the installation of the electric light; the improvement of the tanks, besides general repairs and redecoration. The works will be under the direction of Mr. A. H. TILTMAN. When they are completed it will be necessary to make the collection attractive. It should be admitted that aquaria have ceased to be novelties, and if they are to become profitable it will be necessary to collect something else besides examples of commonplace fishes.

SALISBURY HOUSE, FINSBURY, E.C.

UNITARIAN CHURCH, BIRKENHEAD.

THIS new church, for the Unitarians of Birkenhead, is about to be erected on land adjoining their present premises on Bessborough Road. The plan consists of nave, transepts and chancel. By placing the side aisles next the outer walls uninterrupted view of the preacher is assured for the whole of the congregation. Access to each pew can be obtained from either end, and by placing the radiators under each window in these side aisles no cold air can find its way into the body of the church without passing over them, and thus the chilled feeling which so often occurs where the seats are brought up to the outer walls will be entirely obviated. The unusually large waiting hall or vestibule near the main entrance was desired by the congregation, and over it is a small gallery reached by a stair from the vestibule. Externally the building will be built of 2½-inch red Ruabon wire-cut bricks with thick white joints, and the stone dressings will be of local red freestone from Heswall quarries. The roof will be covered with small green Cumberland (Tilberthwaite) slates.

The interior will be faced with the same local freestone as the exterior in parts, and the rest plastered, whilst the roof and woodwork will be pitch-pine.

The work was submitted to competition amongst a limited number of local architects, and the first place was secured by Mr. J. JOSEPH TALBOT (WILSON & TALBOT), of Commerce Court, Liverpool, and Central Chambers, Bolton.

The exterior view, which was in this year's Academy, was published in our last week's issue.

TEMPLE BRUER.

IN a volume published in 1719 is the following entry:—
 "A Temple on an Heath. Here seems to have been a Preceptory of the Knights-Templars, for there is to be seen the ruinous Walls of a demolished Church, not unlike those of the New Temple in London."

The Rev. G. Oliver, in 1837, described the place, and the following extracts from the book appear in the *Lincolnshire Chronicle*:—

The tower of Temple Bruer, where the haughty knights of the Temple once had their princely residence, and were protected by a numerous train of armed retainers, the intermediate space being dotted by farmsteads, accompanied with the substantial appendages of barns and granaries and streets of corn stacks, all bespeaking opulence and comfort and exciting in the mind a train of ideas declaratory of Old English happiness, cemented by the exercise of British hospitality. I confess I gazed with admiration when I first beheld this scene, and stern reality for a moment gave way to poetic thoughts and pastoral musings, but the blissful delusion was soon at an end, and I passed on under the reflection that it was something to have enjoyed even a moment's unalloyed happiness.

The Preceptory of Temple Bruer was founded in the twelfth century by Matilda de Caux, or by the first William d'Esseby, for the testimonies in favour of both these claimants are very conflicting and uncertain. The latter, however, was one of its early benefactors, as was also Robert de Everingham, whose ancestor had succeeded to considerable property in this neighbourhood by marriage with one of the daughters and co-heirs of Geoffery Alselin, which he himself had further augmented by marriage with the grand-daughter and heir of the above Matilda de Caux. Great improvements were soon introduced on the estates with which the Temple had been endowed. Buildings rapidly arose and spread over the barren waste, a circular church was built on the model of the Holy Sepulchre at Jerusalem, with a tower towards the east, and a town rose rapidly on the extended heath. Royal charters were obtained for a weekly market, which was held first on a Thursday and subsequently on Wednesday, and an annual fair in the month of May. (Rot. Chart. 43 Hen. III. m. 4, for "maner' mercat' et feria.") And the disorders which preceded the reign of Edward I. made a patent necessary for fortifying the exterior gate of the Temple. The situation of this gate is still pointed out by two mounds where the flanking towers stood, and they go by the name of the "Bar Gates" to this day.

In the years 1832 and 1833 Mr. Chas. Chaplin, of Blankney, placed some workmen under my direction for the purpose of excavating the foundations which had been undisturbed on the north and west of the tower. The first excavation was made at the tower, as I confidently expected to find a vault in that situation, because the floor of the lower storey is elevated 5 feet above the ancient surface of the ground. Whatever space might formerly have existed here, it had been filled in, but we came to a narrow subterranean passage, which appeared to take its rise in this vault, and issuing under the north door by a winding direction eastward, passed on to the buildings in that quarter, the very foundations of which have disappeared. The walls of this passage are coated with plaster. There is a footnote to this effect:—"I am told that another passage exists in its primitive state. It is described as being formed of brick, about 4 feet in diameter and 6 in height, and arched over; perfectly clean and dry, and of sufficient capacity to admit a single person. It runs in a north-westerly direction, and is said traditionally to reach as far as Wellingore, a distance of two miles, but this is scarcely probable, although about six-and-thirty years ago it was opened and explored, and one of the workmen proceeded in with a candle to a considerable distance, until fear compelled him to return, after an expedition of more than an hour. We attempted to find the entrance of this passage from the recollections of those who saw it at the above period, but without success."

In our researches on the site of the church, continues the author, we discovered in a perfect state the ancient circular plinth and 4 feet of wall, but buried under a vast accumulation of rough and squared stones, a large number of them handsomely carved and polished. Norman columns and capitals, zigzag and other mouldings, earth and cement, and the tangled roots of large trees which grew amongst the foundations. These beautiful details of the original building, consisting of most of the varieties of Norman enrichments, were soon scattered over the Temple yard in great profusion, and the spectator possessing any portion of antiquarian feelings, on viewing these relics would be unable to repress the train of reflection arising in his mind on the primitive sanctity of the place, the peculiar order of the men who were its inmates, and the utter desecration to which it was ultimately consigned at the final dissolution of the military order to which it belonged.

The circular church is 52 feet in diameter within, and appears to have been supported by a peristyle of eight cylindrical columns, with massive bases and capitals, from which

sprang a series of circular arches profusely ornamented with bold zigzags and other Norman enrichments, occupying, together with the aisle or space thus formed, exactly one-half of the diameter. The outer face of the plinth which supports these columns is the segment of a circle, and measures 4 feet 6 inches; while the inner face is only 3½ feet, and the circular impost at the base of the column is 3 feet 2½ inches in diameter, and the column itself 3 feet 2 inches. A portion of the aisle on the north side had been used as a private chapel, in which were a tomb, an altar and a stone bench for the officiating priest. On the west was the principal door of entrance, with an ascent of stone steps and a magnificent porch, the foundations of which remain perfect; and in the floor are two coffin-shaped stones, one plain and the other charged with a cross bottonny fichée in relief. No interments, however, were found beneath them. A communication was formed beneath the church and the lower storey of the tower by means of cloisters; and this small apartment, which could have admitted but few persons as it is only 17 feet square, was fitted up for performance of high mass, and was probably used as a choir or chancel. Inserted in the wall on the east side of the south window are a pair of arches springing from cylinders with foliated capitals and surmounted by a crocketed canopy, which contain a piscina. On the other side of the window are two stone stalls to correspond; and in the west wall is a beautiful arcade of five massive retiring arches, handsomely finished with a rich and tasteful display of the torus moulding, now much dilapidated, and supported on cylinders having capitals ornamented with the trefoil leaf. Under each of these arches is a stone seat.

This tower owes its preservation to the taste and good feeling of Mr. Charles Chaplin, of Blankney, who has furnished it with a new roof, and otherwise effectually secured it against further dilapidations. It has four stages separated by string-courses, and stands on a massive basement, to which its preservation amidst the wreck of the main buildings may be in some degree attributed. The east side has a lancet window in each of the second and third storeys, and in the south a large window of three lights trefoil under a pointed arch and drip-stone resting on blank shields; above this is a plain circular-headed window, and the upper storey containing a square on each face. In the north face of the tower is an ancient doorway, with a circular arch over a large transom stone, placed as if intended to aid the arch in support of the superincumbent pressure, and on this account it is conjectured by King to be of Saxon workmanship; but it is now walled up, and to the eastward are a pair of small arches in the wall. At the north-west angle is a clustered column, from which a groined roof has evidently sprung, and about the centre of this face, at the same elevation, a bracket or impost remains, which has probably been inserted for the same purpose. At the north-west angle of the tower within is a capacious stone staircase much worn, which mounts to the rooms in the second and third storeys, as well as to the battlements.

Over the cloisters above-mentioned were dormitories, which appear to have been enlarged from their original dimensions at some subsequent period, probably when the establishment was transferred to the Hospitallers, the older works having evidently been removed to make way for the more recent, for there appear marks in the tower indicative of two separate roofs, the one a pitch roof, the other a shelving, and both of a date more modern than the tower itself, as is probable from the existence of an original window in this face, across which the added roof has taken its course so as to divide it into two unequal portions, the lower part being included in the chamber over the cloisters.

On the floor at the east end of the church was an encaustic pavement, and several glazed tiles have been thrown out, of diversified shapes and colours; some are triangular, some square and others oblong, and they were doubtless laid in such a manner as to compose some harmonious pattern. Beneath the church and tower was a perfect labyrinth of vaults and dungeons and intricate passages, arched over with stone, branches of which run under the doors of the church and tower and below the pavement of the cloisters.

The churchyard or cemetery was on the north side of the west porch, and the graves were placed in lines round the outside of the building. They are very numerous, and those which were unavoidably opened by the process of excavation contained skeletons, but no relics of coffins. The bottom of the grave was the surface of the limestone rock, the sides were lined with flat stones taken from the neighbouring quarry, and the whole was covered down with a rough stone of greater dimensions. They were, in fact, legitimate kistvaens. In these graves were found arrow-heads of iron, small ornamental brass buckles, and an instrument resembling the blade of a dagger, all corroded with the rust of time and damp; several silver coins of the early Edwards and Henries, one of Henry VIII. and another of Elizabeth; some Roman copper coins, one of which is a Theodosius, with several Nuremberg and Lombardic tokens; a gold ring set with emeralds; the head of a rosary

made of ebony; a small bell, which was probably fixed, with many others of the same kind, according to the custom of the time, to one of the knight's horse furniture. We also took up an antique Sheffield thwitel of great beauty, with an ornamental haft and a blade inlaid with silver in elegant devices, both on the sides and back, which latter is of great thickness; and two large keys of curious construction, the one plated with silver, the other with gold.

On the south side of the porch are several small rooms and narrow passages, which adjoined the church wall, and these appear to have been offices, for one of the rooms, which measures 14 by 14½ feet, was filled with pure lime. The walls of this part of the buildings are uniformly 2½ feet in thickness, while those of the church and porch are more than 4 feet; and the latter are built of stone, rough as when taken from the quarry, and entirely coated with plaster inside and out, except the plinth, which is handsomely squared and moulded.

THE NEOLITHIC SETTLEMENT AT KNOSSOS.

ACCORDING to a paper communicated by Mr. A. J. Evans, M.A., to the British Association, the hill of Kephala at Knossos, which contained the remains of the palace of Minos and early houses going back to the pre-Mycenæan or Kamáres period of Crete, proves to have been the scene of a much earlier and very extensive Neolithic settlement. The exploration of this by the author, in addition to the work on the later remains of the "Minoan" Palace, has been greatly aided by the grant from the Association in 1900. The remains were contained in a stratum of light clay underlying the later prehistoric buildings, and which seems to have been formed by the disintegration of successive generations of wattle and daub huts and their clay platforms. This clay stratum, which had been a good deal reused for later foundations, showed a mean thickness on the top of the hill of about five metres. In some places it was over seven metres thick and went down to a depth of about ten metres below the surface. It contained an abundance of primitive dark hand-made pottery, often punctuated and incised, and with white chalky inlaying, more rarely chrome-coloured. The ornamentation was angular and of textile derivation. Stone implements abounded of greenstone, serpentine, diorite, hematite, jadeite and other materials. Among these were over 300 celts or axes, besides chisels, adzes, hammers and other implements. The most characteristic implements, however, were the stone maces, the occurrence of which was especially important as bringing the Cretan Stone Age into near relation with that of Anatolia, and indeed of Western Asia in general, where, as in the early deposits of Babylonia, stone maces formed a marked feature. This characteristic was shared by predynastic and protodynastic Egypt. Another interesting feature among the remains were the small human images of clay and marble which supplied the ancestors and prototypes of the stone images found in the early Metal Age deposits of Crete and the Cyclades. Their Anatolian analogies were pointed out, and reasons were adduced for their ultimate derivation through intermediate types from clay figures of a Babylonia mother-goddess, such as those lately found in the very ancient deposits at Nippur.

The Neolithic settlement of Knossos was the first settlement of that period yet explored in the Greek world, and in many ways threw an entirely new light on the beginning of civilisation in that area. The contents showed a marked contrast to the earliest Metal Age remains, such as those from the deposit of Hagios Onuphrios in Crete, the date of which was approximately fixed by their association with Egyptian relics and the indigenous copies of them from 2800 to 2200 B.C. There were here no later vase-forms of the high-necked and spouted class, no traces of painted pottery or metal and no single example of the spiraliform decoration which in the early Metal Age deposits is found fully developed. This negative phenomenon strongly weighed in favour of the view that the Ægean spiral system was introduced during this later period with other decorative types from the Egypt of the Middle Kingdom, where it had already attained a high development.

The Neolithic stratum of Knossos itself actually underlay later buildings belonging to three distinct prehistoric classes:—(1) The "Kamáres," or Early Metal Age Period of Crete, illustrated by the contents of some of the earlier houses. The painted pottery in these was in some cases a mere translation into colour of the incised and punctuated Neolithic designs. This period is approximately dated from the relics found in the Hagios Onuphrios deposit and the Cretan vase fragments found in Egypt in a twelfth dynasty association from c. 2800 to 2200 B.C. (2) The Transitional Period, between the "Kamáres" age and the Mycenæan. It is probable that the earliest elements of the palace itself belong to this period, including an Egyptian monument ascribed to the close of the twelfth or early thirteenth dynasty, c. 2000 B.C. (3) The Mycenæan period proper, the flourishing epoch of which is approximately

fixed by the correspondence of some of the wall-paintings with those representing the Keftiu on Egyptian tombs, c. 1550 B.C.

Considering the distinct gap in development which still separates the latest elements of the culture represented by the Neolithic stratum of Knossos from the fully developed Kamáres style, it would be rash to bring down the lowest limits of the settlement later than about 3000 B.C. On the other hand, the great depth of the deposit must carry its higher limit back to a very much more remote date. The continued exploration of the Neolithic remains of Knossos is necessary for the full elucidation of many of the problems suggested by these discoveries.

MECHANICAL EXHIBITS IN THE GLASGOW EXHIBITION.

A PAPER by Mr. David Home Morton, C.E., on "The Mechanical Exhibits in the Glasgow Exhibition," states that to those who had studied the contents of previous great exhibitions on the continents of Europe and America, the first tour round the Machinery Hall and through the pavilions and spaces devoted to mechanical exhibits might produce a feeling of disappointment, not because the exhibits were lacking in number or variety, but because in many departments the international character to which the Exhibition, as a whole, laid claim was entirely wanting, because some of the most important developments of recent years were illustrated inadequately or not at all, and because, taking the Exhibition merely in its local aspect, the representation, magnificent in some departments, failed in others to give any full idea of the magnitude and variety of those enterprises which had made the city of Glasgow, with its surroundings within a radius of 30 miles, one of the world's great centres in metallurgy, mechanical engineering and shipbuilding. Nevertheless, there was abundance to provide the visitor with all the hard work, physical and mental, of which he was capable during all the time he could afford to give to the study of mechanical exhibits. The exhibition of ship models, historical and contemporary, in the Grand Avenue, was probably the finest demonstration of British, or, more correctly, Clyde naval architecture and shipbuilding which had ever been seen, and the four locomotive engines at the north end of the Machinery Hall, near the entrance, were almost perfect examples of their builders' art. Nevertheless, the dominant exhibits were the trophies in steel. The Exhibition might, indeed, be said to mark the triumph of steel, and particularly of cast steel. Having made an exhaustive criticism of the iron and steel exhibits, he passed on to the engineers' machine tools. The British tools displayed were worthy of their makers' reputation, but, in his opinion, they failed to convey any just idea of what was being done, either in the establishments of those who had exhibited or of those who had refrained. Another point he emphasised was that in an Exhibition erected practically adjacent to some of the most noted marine engineering establishments in the world, it was a matter for regret that marine engineering should be so inadequately represented. In view of the great developments in electrical traction, a more representative display of tramway material and equipment might also have been anticipated.

EXPLORATIONS IN CRETE.

A REPORT of the committee, consisting of Sir John Evans, K.C.B., F.R.S. (chairman), Mr. J. L. Myres (secretary), Mr. A. J. Evans, Mr. D. G. Hogarth, Professor A. Macalister and Professor W. Ridgeway, has been presented to the British Association. In order to present the results of the season of 1901 in their proper bearings the committee introduces its report with a retrospect of British exploration in Crete.

The Cretan Exploration Fund was formed in 1899 with the object of assisting British explorers and the British School at Athens to investigate the early remains of the island, which from indications already apparent seemed likely to supply the solution of many interesting questions regarding the beginnings of civilisation in Greece. To the furtherance of this work, begun in the spring of 1900, the grant of 145£ was made last autumn by the British Association.

Already in 1894 Mr. Arthur Evans had secured a part ownership (completed last year) in the site of Kephala at Knossos, which evidently contained the remains of a prehistoric building. Excavations, to which the fund has largely contributed, begun by him in 1900 on this site and continued during the present year, have brought to light an ancient palace of vast extent, which there is every reason to identify with the traditional house of Minos, and at the same time with the legendary "Labyrinth."

The result of the excavations of 1900 was to unearth a considerable part of the western side of this great building, including two large courts, the porticoes and entrance corridors, a vast system of magazines, some of them replete

with huge store jars, and a richly-adorned room, where between lower benches rose a curiously-carved gypsum throne, on which king Minos himself may have sat in council. The second season's work has uncovered a further series of magazines, the whole northern end of the palace, including a bath-chamber and an extensive eastern quarter. It was only towards the close of this year's excavations that what appear to have been the principal state rooms first came into view. A triple flight of stone stairs, one flight beneath another, here leads down from an upper corridor to a suite of halls, showing remains of colonnades and galleries. It was at this interesting point that, owing to the advanced season, Mr. Evans was obliged to bring this year's excavations to a close.

Apart from the architectural results already gained, the finds within the walls of the palace have been of such a nature as to throw an entirely new light on the art and culture of prehistoric Greece. Partly still clinging to the walls, partly on the floors of the chambers, were found the remains of a whole series of fresco-paintings. Among these the full-length figures of the cup-bearer supply the first real portrayal of a man of the Mycenaean age, while the miniature groups representing court ladies show a liveliness and expression far beyond any work of the kind in contemporary Egypt. Allied to this branch of art are the painted reliefs in *gesso duro*, showing a force and naturalism for which no parallel can be found till the great days of Greek sculpture some ten centuries later. To the remarkable bull's head discovered last year the more recent excavations have added parts of human figures, in which the muscles and even the veins are reproduced with a singular mastery of execution.

The marble mouth of a fountain in the shape of a lioness's head and a triton shell of alabaster, together with many other beautiful stone vessels and architectural ornaments, also evidence the high level already attained in the sculptor's art. Among the minor arts represented is that of miniature painting on the back of crystal and intarsiawork of ivory, rock-crystal, enamel and precious metals, of which a splendid example has been found this season in the remains of a royal draught-board. Other finds illustrate the connections with ancient Egypt and the East. Part of a small diorite statue from last year's excavations bears a hieroglyphic inscription fixing its date about the beginning of the second millennium B.C., while a more recently discovered alabaster lid bears the cartouche of the Hyksos king, Khyan. A fine cylinder of *apis lazuli*, mounted with gold and engraved with mythological subjects, bears witness to the early connection with Babylonia.

But of all the discoveries made within the palace of Knossos the most interesting is the accumulated evidence here for the first time afforded that there existed on the soil of prehistoric Hellas a highly developed system of writing some eight centuries earlier than the first written Greek monuments, and going back six or seven centuries, even before the first dated record of the Phœnician script. A whole series of deposits of clay tablets has come to light, many of the most important of them during last season's excavations, engraved with a linear script, often accompanied by a decimal system of numeration.

That these documents largely relate to the royal stores and arsenals is seen by the pictorial illustrations with which the inscriptions are often accompanied. Others, in which signs representing men and women frequently recur, probably contain lists of slaves or officials. Others again of a different class may, perhaps, ultimately reveal to us fragments of contemporary records or the actual formulas of Minoan laws.

Besides these linear tablets there was discovered a separate deposit of clay bars and labels containing inscriptions of a more hieroglyphic class. Although contemporary with the linear tablets, the script on these is apparently of quite distinct evolution, and in all probability in a different language. The characters answer, in fact, to the sign-groups already observed in certain seal-stones mostly found in the east of Crete. The hieroglyphs themselves present many parallels to the presumed pictorial prototypes of Phœnician letters.

Beneath the palace itself and the adjoining houses, and underlying the whole top of the hill, was also a very extensive Neolithic settlement. The relics found, such as the small human figures of clay and marble, supply the antecedent stages, hitherto wanting, to the Early Metal Age culture of the *Ægean Islands*.

In addition to the assistance given to Mr. Evans in his work at Knossos, the Cretan Exploration Fund has contributed towards various works of exploration in the island undertaken under the auspices of the British School at Athens. In 1899 the late director of the school, Mr. D. G. Hogarth, excavated a series of prehistoric houses in the lower town of Knossos. He found in these many remarkable painted vases, showing that a highly developed ceramic art flourished here already before the days of the civilisation known as Mycenaean. A large number of similar houses await exploration; in fact, the whole plan of the early town could probably be recovered. Mr. Hogarth further successfully explored the great cave of

Zeus on Mount Dicta, discovering remains of a prehistoric sanctuary and large deposits of votive bronze figures and other objects, among which the double axe, the symbol of the Cretan and Carian Zeus, was specially conspicuous.

During the present year Mr. R. C. Bosanquet, the new director of the British School, has carried out an exploration of the site of Praesos, in the easternmost region of Crete, in historic times the chief civic centre of the original Eteocretan element of the island. The remains on the actual site of Praesos proved to belong to the Geometrical and later periods. A remarkable inscription was found, however, the second of its class, written in Greek characters of the fifth century B.C., but composed in the old Eteocretan language. Two sanctuaries with votive deposits also came to light, and the remains of a large public building of Hellenistic date, which may have been an "Andreion" of the kind in which the Cretan citizens met for common meals.

This season Mr. Hogarth has also been enabled by a grant from the fund to explore an ancient site at Zakro in the extreme east of the island. He has there uncovered a small Mycenaean town with well preserved remains of the lower part of the houses and magazines, and a pit containing fine examples of early pottery. But the most important discovery was a deposit of clay impressions of Mycenaean gems and signets containing 150 types, some of them throwing a new light on the early cult of Crete. Among other subjects represented was the Minotaur, which also occurs on a seal impression recently discovered in the palace at Knossos. Furthermore, some interesting cist-graves were found in caves about Zakro. These yielded incised and painted pottery of the pre-Mycenaean age, including types novel in Crete but familiar in Cyprus and Egypt. The general result has important bearing on the origin and history of Mycenaean civilisation in Crete.

Other interesting sites, already previously secured for British excavation, remain to be explored. The executive committee of the Cretan Exploration Fund, however, are of opinion that, before devoting any sums towards breaking new ground, a sufficient amount shall be raised to enable Mr. Evans to complete his excavation of the palace of Knossos, a considerable part of the cost of which has already fallen on the explorer's shoulders. The large scale of the work, on which throughout the whole of last season 200 workmen were constantly employed, makes it necessarily costly, and in this case, in addition to many other incidental items of expenditure, a great deal has to be done towards the conservation, and in some cases even the roofing-in, of the chambers discovered. It is estimated that a sum of between 1,000*l.* and 2,000*l.* will be necessary for the adequate completion of this important work. The unique character of the results already obtained is, however, so widely recognised that the committee confidently trust that no financial obstacles will stand in the way of this consummation.

PROTECTION OF BUILDINGS FROM LIGHTNING.

A PAPER by Mr. Killingworth Hedges was read before the British Association, in which it was said that the last time the subject was brought before the members was at the Bath meeting in 1888, when a joint discussion of Sections A and G was held; but there has been no official report as to the effect of lightning stroke upon buildings protected by conductors since the Lightning Rod Conference of 1882. Interest in the subject has been again revived, first, by the *Electro-Technische Verein* of Berlin, who have this year published a set of rules; and, secondly, by the establishment in this country of the Lightning Research Committee, organised jointly by the Royal Institute of British Architects and the Surveyors' Institute. The author compared continental and American practice, and gave an account of his rearrangement of the system used at St. Paul's Cathedral, where the conductors, erected as recently as 1872, were found to be totally inefficient, both as regards the conductivity of the joints and the resistance of the earth connections. In the plan recommended, both for that installation and for the more recent one at Westminster Abbey, the number of ordinary conductors from air to earth has been greatly increased, and, besides these, horizontal cables are run on the ridges of the roofs and in other prominent positions so as to encircle the building, being interconnected to the vertical conductors wherever they cross one another. The horizontal cables are furnished at intervals with aigrettes, or spikes, which are invisible from the ground level, and are designed to give many points of discharge. At the same time they, in conjunction with the cables, would receive any side flash which might occur should any portion of the building receive a direct stroke of lightning.

The unreliability of soldered joints for conductors, whether of cable or tape, has led the author to design a special joint box, which can be applied for uniting any portion of the system together in such a manner as to give great mechanical strength.

as well as good electrical contact; at the same time any box can have points inserted so as to form an aigrette in any desired position. Owing to the difficulty of sinking an earth plate of sufficient area, on account of old foundations, a special form of tubular earth has been designed which takes up little space and has the advantage that if a suitable moist ground is not obtainable the desired low electrical resistance is attained by leading a tube in connection with the rain-water pipes, so that a portion of the rainfall is diverted to the tubular earth.

The author alluded to the immense amount of damage to property annually occurring which might be prevented if efficient conductors were installed. He mentioned that instead of every church having its lightning conductor not 10 per cent. are so provided; and in the case of other public buildings the percentage is not much larger, the reason in the case of the former class of buildings being that a vicar wishing to safeguard his church has usually to pay the cost out of his own pocket.

Architects, according to Mr. Killingworth Hedges, as a rule treat the question of lightning conductors in a very brief manner, and in their specifications seldom say anything as to the way in which they are to be run, or the necessity for good joints and good earth connections.

PREHISTORIC PALESTINE.

AMONG the papers read before the Anthropological Section at the meeting of the British Association was one by Mr. R. S. Macallister on the recent excavations in Palestine. During 1899 and 1900, he said, these excavations had been carried out by Dr. Bliss and himself, on behalf of the Palestine Exploration Fund, in four cities on the borders of the ancient territory of the Philistines. The main purpose of the excavation was the recovery of the long-lost city of Gath. Though this hope was disappointed, a large amount of archaeological material was accumulated, and much new light was shed on the culture of the inhabitants of Palestine at various periods. The historical period of Palestine was of such unique interest that it absorbed the attention of all who visited the country, so that hitherto the traces of the prehistoric period had not been sought for. The early pre-Israelite, the late pre-Israelite, the Jewish and the Selucidæ now demanded attention. He described the sites excavated, the chief of which was at Tel-es-Safi, a height overlooking the ancient valley of Elah, famous in Biblical history as the scene of David's victory over Goliath. He gave an account of the character of the buildings and of the remains found, which consisted largely of pottery. At a depth of 14 to 18 feet at Tel-es-Safi they found a building strongly suggestive of a place of religious worship, whose walls were afterwards adapted for domestic purposes, and there seemed every reason for regarding it as one of the "high places" frequently mentioned in the Book of Kings. It was difficult to draw a line of demarcation between the pre-Israelite and the Jewish periods in point of time, though differences were obvious. The Jewish people and the defeated Canaanite tribes seemed for a long while to have lived together, and probably the Jewish nomads utilised to the full the superior culture of the natives whom they conquered. But whether the change took place at the period of Joshua's conquests or at the chaotic period of the Judges, it was certain that a time came when pre-Israelite civilisation was practically annihilated. This was specially marked in the disappearance of coloured ornament on pottery and in the clumsy shape of the vessels. One of the most curious results of the excavations was the scarcity of objects of personal adornment. Hardly anything except beads were found. In their richest mine, but whose objects were not earlier than 500 B.C., beads in agate and other pretty coloured stones were found. In the whole period from pre-Israelite to Jewish they found only two objects of gold—one a little ring, apparently an earring, and an iron finger-ring or thumb-ring, with a layer of gold leaf. Writing made its appearance during this period. It was entirely confined to potters' stamps. Of greater interest were the stamps bearing a figure of a flying scarabeus, with above it a word signifying "To the King," and below it the name of a town, Hebron Ziph Shocho, mentioned in the Bible, and Memsbath, of which nothing is known. Some light was thrown on the pre-exilic religion of Palestine. Jars, bearing potters' stamps, some of them showing names like Azariah, Shebamah, compounded with the name Jahweh, were found side by side with terra-cotta plaques bearing naked goddess figures, or with yet grosser emblems of Phœnician nature worship.

Professor G. A. Smith testified to the value of the work done by Dr. Bliss and Mr. Macallister, and urged the importance of proceeding with excavation in Palestine as speedily as possible. He himself had just been back in the country on the east of the Jordan after a ten years' absence, and he found that most of the sites best adapted for the purpose of excavation had been robbed in the manner Mr. Macallister had described.

The site of the ancient Gadara in 1891 still had the amphitheatre well preserved, the people who lived in caves to the east not interfering with it. Within the last two years all had been changed. A village had sprung up on the site, and the ancient amphitheatre was fast being pulled to pieces. The sooner therefore the mounds of Palestine were explored the better. Every year the loss was becoming irreparable.

THE WIDENING OF PICCADILLY.

THE following letter from Mr. J. Wolfe Barry appears in the *Times* :—

Sir,—Owing to absence from London I have been unable to ask your leave to reply to some of the criticisms which have from time to time appeared in your columns of my proposal for a subway at Hyde Park Corner, as explained in my letters to you of August 5.

Nothing which has yet been said alters my view that any widening of Piccadilly must fail in relieving the congestion of traffic at the spot in question. It does not, in fact, touch the root of the matter, which is to be found in the two highly-important streams of traffic impinging on one another at right angles at the south end of Hamilton Place; and I see that the Chief Commissioner of Police has reported that at certain times of the day about one-half of the traffic passing between Hyde Park Corner and Hamilton Place turns into Hamilton Place. No widening will alter these facts; and, though an increase in the width of Piccadilly opposite Hamilton Place might afford more space in which the police could pack the rows of opposing vehicles while waiting for each other, one stream must still cross the other, however broad the street be made.

We have seen by experience that the bell-mouthed widening at the upper end of Constitution Hill, made in 1882, for which Mr. Shaw Lefevre, who was then First Commissioner of Head Office of Works, is responsible, though it cost a great deal of money, had simply the effect of clearing the way to Hyde Park and Knightsbridge from Grosvenor Place, and effected but little relief of the congestion of Piccadilly. It removed the block of vehicles from the north end of Grosvenor Place to the south end of Hamilton Place, where it is as bad as ever.

The proposed widening of Piccadilly at the south end of Hamilton Place will do still less, for it affords no new route for any description of traffic; and I therefore venture to prophesy that it cannot be even so beneficial as what Mr. Loftie in his letter to you of August 7 somewhat irreverently terms "Mr. Shaw Lefevre's clever imitation of Hampton Court maze," which, at any rate, enables carriages to enter and leave Hyde Park more easily.

As for the widening of Piccadilly by taking land from the Green Park eastward of Down Street, it must be by now obvious to any one who knows London that it is uncalled for. The roadway and footpaths are there ample, and this is specially the case as there are houses on one side only of the thoroughfare. Thus we are brought to the comparative advantages and disadvantages of the County Council scheme, limited to a widening opposite only to Hamilton Place, which has the powerful support of Mr. Shaw Lefevre as chairman of the improvements committee, and to the *pros* and *cons* of my proposal. With these general considerations I approach the points raised by various correspondents in their letters to you in criticism of my suggestion.

Before replying to the semi-official pronouncement of Mr. Shaw Lefevre, may I point out to your correspondent "Offside" that, as my proposed sunken road and subway would become the main arterial roadway east and west, there would be no crossing of the road for any but comparatively little traffic to get to its proper side, and this, of course, would be done by means of the existing roads, which would be undisturbed? The main stream, as I have said, would be by the sunken road, and would flow along it just as it now does, though by a new route and at a lower level. Consequently at its west end the only crossing would be traffic from Knightsbridge seeking Grosvenor Place or Constitution Hill, which, in fact, has now to cross all traffic coming from the east; and the only crossing at the western end would be traffic coming from the south side of Piccadilly and going into Hyde Park, which, again, has now to cross all traffic coming from the west. Neither of these sources of traffic is comparable in importance with the main north and south streams of vehicles between Park Lane, Mayfair and Paddington on the north, and Westminster and Belgravia on the south, which the main Piccadilly stream has now to encounter at Hamilton Place. With regard to another critic, Mr. Hume Williams, who fears congestion opposite Wilton Place, where he lives, may I suggest that my scheme doubles the width of the roadway opposite Wilton Place, and that it is unreasonable to suppose that doubling the width of a road will in itself make a block of vehicles? So far as he demands the extension of

he widening westward into Knightsbridge, I am entirely with him; but, as Mr. Rudyard Kipling says, that is another story, and it has nothing to do with the sunken road. For the rest of your correspondents I can only say that I recognise with great satisfaction that many of them, though their ideas differ as to the mode of cure, admit the truth of my proposition that the only effectual mode of relieving the congestion of London traffic at crowded spots like Hamilton Place is by crossing the opposing streams of vehicles and pedestrians over or under each other. I begin to hope that before long it will be realised generally that this necessity is a matter quite apart from the widening of arterial thoroughfares, which have become too narrow for the requirements of the present day.

I now come to Mr. Shaw Lefevre's remarks on my proposal, and here let me say first that I am pleased to see that he at least considers it practicable, as it certainly is. But he couples it with an alternative scheme for a subway, pointing north and south from the north end of Hamilton Place to Grosvenor Place, which I beg leave to observe is rather like trailing a red herring across the scent. A north and south subway differs in essentials from one which would point east and west. For, as I pointed out in my original letter to you, the levels of Piccadilly, which fall rapidly in both directions from the gateways of Hyde Park, are extremely favourable to the subway which I suggested, whereas the gradients of a north and south subway are distinctly unfavourable, seeing that Hamilton Place rises towards the north, so that any road carried thus under Piccadilly must rise with a long and steep gradient before it can join Park Lane. Moreover, a sunken road from the north end of Hamilton Place must involve important interference with private property of the most valuable description, whereas my proposal does nothing of the kind. By mixing up the two suggestions Mr. Shaw Lefevre is able to throw at our heads an estimate of 250,000*l.* for the north and south subway, which he prefers for some undisclosed reason; and though he admits that the east and west subway would not be so expensive he gives no corresponding estimate of it. I should have thought that this might have been possible for him, as he says that my scheme (foreshadowed by me two years ago at the Society of Arts) was before his improvements committee last year. At any rate, it seems probable from what he says about the levels that my proposal must have been examined in a perfunctory way at Spring Gardens. Many of the public who have read Mr. Shaw Lefevre's letter have no doubt run away erroneously with the idea that something like 250,000*l.* would be involved in the cost of my suggestion. Mr. Shaw Lefevre merely says it would be extremely costly, and twits me with not having considered this matter. I submit, on the contrary, that the cost will be moderate compared with its utility, consisting wholly of works and not involving claims for property or compensation, and that I had carefully in view these circumstances when I made the proposal.

When it comes to naming a trustworthy estimate it is necessary to prepare detailed studies from which to take out quantities, both of which are somewhat lengthy processes at any time, but especially during the vacation. However, since I wrote to you last month I have made these more detailed studies of a subway with inclined roads of a width of 60 feet, which on full consideration seems to be ample; with the result that I find that I can greatly improve the original sketch, and can shorten the subway to a length of 210 yards, that the length of the inclined roads will be less than I indicated, that the gradients can be at least as favourable as those which I described, that there is ample room for water and gas mains above the subway (another difficulty suggested by Mr. Shaw Lefevre), and, lastly, that the cost need not exceed 110,000*l.*

I think these explanations answer the engineering criticisms of Mr. Shaw Lefevre, and we may now consider his æsthetic objections. Mr. Shaw Lefevre says "deep open cuttings would be very unsightly and objectionable for many reasons," and Mr. Akers-Douglas in Parliament repeated the cry against deep open cuttings and brick walls, and suggested engineering monstrosities. With regard to the "many reasons," I take it from what followed that Mr. Shaw Lefevre supposed that the levels which I quoted were wrong; which, as I have explained, is not the case. And so we come back in both cases to "deep open cuttings" being the real cause for æsthetic protests. From the words used it seems probable that both gentlemen had in their mind's eye something like an ordinary railway cutting, of which I do not know what depth, either with unsightly slopes or brick-retaining walls, made without the slightest attempt at artistic treatment. But there is nothing so easy as to raise a bogey, and not only affect to be frightened at it, but to try also to frighten other people. The sunken road which I proposed can scarcely be called deep, as it would not be more than 19 feet at its deepest part, and would be level with the street at its other end. It would be entirely different from a railway cutting, as the sides would be upheld by retaining walls faced ornamentally with stone, panelled, arched, or pilastered, and white glazed bricks might be used in the panels if found to be architecturally congruous.

I have never heard that the retaining walls of Trafalgar Square or New Palace Yard are ugly, and, in fact, they are not. At any rate, such works admit of any amount of artistic treatment. The whole would be surmounted by a stone balustrade such as we see on Waterloo Bridge or in Trafalgar Square, or on the terrace of Somerset House, or by ornamental wrought-iron railings, as in New Palace Yard. All this I indicated in my original letter, but it is calmly ignored by the two official critics whom I have mentioned. I venture to ask why should such things be ugly at Hyde Park Corner in the future any more than they are eyesores now at the places which I have mentioned? and I assert boldly that they need not be in the least unsightly under proper architectural advice.

Another example occurs to me which is still more to the point. The French for the Paris Exhibition erected a beautiful and very wide bridge across the Seine, named the Pont Nicholas II., and they wisely carried the roadway (a very important one) on the north bank of the river, which is at right angles to the axis of the bridge, under the bridge by an inclined road and subway instead of crossing the two streams of traffic at right angles to each other. The walls on each side of the roadway are anything but unsightly, being executed somewhat in the way which I have mentioned. Why cannot we do as well or better at Hyde Park Corner? There can in truth be no difficulty in the matter if, following the example of the Parisians, who have reason to be proud of their public works, we associate with the engineer of the County Council any one of half a dozen well-known architects, the names of whom will occur to anyone.

Before leaving my æsthetic critics who curiously enough propose to destroy a number of trees between Down Street and the Wellington Arch, I should like to say that I find (thanks to a plan published by the *Daily Chronicle*) that by bowing the sunken road about 40 feet to the south almost all the trees in question could be preserved and remain between the sunken road and the existing thoroughfare of Piccadilly. The additional abstraction of land from the body of the Green Park might not be too high a price for the preservation of the trees, and the land between the old and new roadways, though partially severed, would remain with its trees and grass as a screen between the two roads.

If, then, we wish to do the thing which is necessary, viz. separate the conflicting streams of traffic at Hamilton Place, it can be done very easily by a subway, and so that the work may be an ornament to London rather than the opposite. If, on the other hand, we deliberately adopt the half measure of a mere local widening and are content to prepare another failure, it is better to boldly tell us that we must take the cheaper but inefficient expedient because it is cheaper, than to condemn the complete proposal for cure by inferentially exaggerating its cost, by calling in question without full investigation its engineering features and by lifting up hands of holy horror about ugliness which need not exist.

Mr. Shaw Lefevre, lastly, says let us try the widening of Piccadilly first and see what it will do. I ask what purpose, except a mistaken economy looking very like extravagance, can be served by embarking in a scheme which is foredoomed to failure. Why should we waste some thousands of pounds on a proposal which will still leave the north and south traffic to jostle its way across the east and west streams of vehicles?

If the County Council and His Majesty's Office of Works are in earnest in the question, let me submit that they should carefully study the scheme of a subway without any foregone conclusions against it, because it is a new departure or because it will cost more than widening Piccadilly; and that they should try by a model prepared under good advice how the sunken road could best and most artistically be done, for it stands to reason that it is the only complete solution of a question urgent enough now and getting worse every year.

STREETS AND TRAFFIC.*

AT this the first meeting of the British Association of the new century I wish to lay before you some of the interesting problems presented by recent developments in means of locomotion on land which demand the best thoughts not only of our engineers, but of everyone interested in the improvement in means of travelling and in the more rapid transit of goods. A rather curious speculation presents itself to us. This is whether the need for rapid communication between town and town may not eventually be supplied by high-speed motor-cars on roads specially prepared for them. Mr. Wells in his interesting forecast in the *Fortnightly Review* seems to think that the time is not far distant when all passenger traffic will be carried on special roads on motor-cars. That the advantages of carrying your family and loading up your belong-

* From an address to the Mechanical Science Section by Colonel R. E. Crompton, M.Inst.C.E., president of the Section.

ings at your own door, in your own or a hired car, and transporting them without any change or handling of your baggage right up to the point where your journey ends, will be so great that even for comparatively long journeys travellers will prefer it to the railway, and that our railways will eventually be relegated to carrying minerals and heavy goods. But without going so far as Mr. Wells, it does seem probable that if only a few passengers require to travel between two business centres such as Manchester and Liverpool, and to occupy only half the time from door to door at present taken by the railway and the two terminal cab rides, it might be better to provide one of Mr. Wells's improved roads on which private owners could run their own cars, paying toll for the road, and on which a public service of cars would provide for those who did not own cars themselves.

I now propose to deal at somewhat greater length with what I think is a most important problem in locomotion, viz. that caused by the congestion of street traffic in our towns and by the undoubted difficulties which exist in carrying our workers to and from their homes in the country to their places of employment in our towns. A large proportion of the workers who during the latter half of the last century lived and worked in the country are now working in towns, although some of them still live outside in order to obtain the advantages of lower rents and of a healthier life for their families, and this last class is likely to largely increase. Those who have been responsible for the enlarging and improvements of our towns have done so much to make town life preferable to country life that the country is gradually being depopulated.

It must be remembered that the laying of tram rails not only blocks ordinary traffic, but in our most crowded streets it introduces dangers to all wheeled vehicles not on rails, motor-cars and cyclists by the skidding of the wheels when they cross the line of rails, and these dangers are daily causing, and are still likely to cause, very serious accidents.

The increased road and street traffic and the development of new means of road locomotion have made imperative some modification of our existing system of roadway administration. Cycles, motor-cars and electrical tramcars have been invented and put on roads which are maintained and worked exactly as they were seventy years ago at the commencement of the railway era, when the population of the United Kingdom was half its present figure and that of the large towns one-tenth of the present figure. During the 150 years previous to the railway era the ancient tracks were gradually improved into tolerably efficient roads for coach and waggon traffic, but after the introduction of railways there was a complete cessation of improvement, as for fifty years after the railways started the old roads were equal to the farmers' and local traffic which the railways left for them; but for the last twenty years the roads near to the great towns have been inadequate, and now that the cyclist and motor-carist travel over the whole of the roads of the country the neglect of our ancient roadway system is very apparent.

Although the urban populations have so greatly increased, the old coaching roads are still the only ones that exist; no main roads parallel to the old ones or alternative to them have ever been made. Towns which are now joined by railways grew out of small rows of houses built facing the main road; in fact in many cases the road made the town. During the early part of the railway era, when the roads were so little used from coaching falling into disuse, encroachments on the roadway took place in and near the towns, such roads being now actually narrower and less suitable for traffic than in the coaching days; so that these towns which owe their existence to these roadways now put every impediment and hindrance to their use by the travelling public. What is needed is that towns situated on our main through roads should provide alternative routes, so that through travellers could, if they desired, avoid the crowded streets of the town. One method of providing such relief roads would be by by-laws providing that all building estates should set aside land for main roads. The building estates which are developed around our great towns never provide a road which can be used as a main line of thoroughfare, although by their very act of building additional houses they cause additional congestion to the main roads. They lay out their roads to obtain quiet for those who live on the estate, and take every possible means to prevent their estate roads from taking a share of the main thoroughfare traffic.

Parliament must take in hand an improved administration of our highways by a comprehensive scheme. Far too many ancient main lines of thoroughfare, already too narrow for the traffic which is on them, are being blocked by having tramways laid on them; these cause the development of building estates, which throw additional traffic on to these thoroughfares. Apart from the roads themselves, the complicated conditions of street and road traffic demand careful regulation. Street traffic should be carried as far as possible by lines of vehicles driven as nearly parallel to one another as possible. The rule of the road, as it is called, and which is embodied in an Act of Parliament, 5 & 6 of William IV., which is com-

monly called the Highways Act, says that every vehicle is to keep as close as possible to the left or near side of the road, except when overtaking another vehicle going in the same direction, and then it is to keep to the off side of the overtaken vehicle as closely as possible. As a matter of fact, everybody knows that this rule is habitually neglected by drivers who, whenever they get a chance, drive down the centre of the road, so that others who overtake them dare not do so on the wrong or near side, but must pass out far to the off side of the road, and consequently interfere with the traffic coming in the opposite direction. This neglect of the rule of the road causes a great waste of space immediately behind every vehicle, and is one of the chief causes of the limited carrying capacity of the streets in cities where the police do not attend to this important matter. It can be remedied by the existing police regulations being adhered to and insisted on by fixed-point constables, or by constables moving about on motor-cars or bicycles. Slow moving and frequently stopping vehicles are another cause of congested traffic. A great deal might be done by arranging that during certain hours much of the slower moving traffic is shunted into alternative routes so as to be kept by itself. An increase in the speed of the street traffic is desirable, for the faster the vehicles travel the less the street is occupied by them. Motor-cars can safely travel at sixteen miles an hour, and therefore need only take half the time and occupy only half the street surface that an omnibus does when travelling at eight miles per hour. Such high speeds as these, which are desirable and perfectly safe for motor-cars, cannot, however, be obtained unless some regulations are made as to the use of the roadways by foot-passengers. There is no rule of the road for foot-passengers—they pass one another on the footpath, or vehicles in the roadway, just as they please. No driver of a vehicle in the road who sees a foot-passenger stepping into the roadway can ever tell with certainty what his movements will be. It will be no hardship to foot-passengers to insist on their movements being regulated.

AN AMERICAN ENGINEER.

DOWN in the heart of commercial New York traffic suddenly ceased for a time, says the *Engineering Record*, and the hurrying crowds of business people, deeply touched by the sad sight, stopped to stand with bared heads while nine companies of regular troops marched slowly to Trinity Church with the body of one of their most gifted officers. A little later a bugler within the church softly sounded "Taps," and the people waiting outside knew that the last military honours had been paid to General William Ludlow, a public servant of the highest type.

He came from a family of considerable standing in New York and Long Island. His military bent of mind was evidently an inheritance from his father, who was breveted major-general for services in the Civil War, and it is worth noticing that a brother, Nicol Ludlow, is a rear-admiral on the retired list. This inheritance of military spirit and the training at West Point, where he was graduated when nineteen years old as eighth member of the class of 1864, was confirmed and moulded by a gallant part in the Civil War. At an age when boys to-day are in the lower classes of colleges and technical schools he was chief engineer of the twentieth army corps and marching through Georgia with Sherman. In a few months he was chief engineer of the army of Georgia, and later because assistant engineer of the entire army under General Sherman. He was in a number of battles, and when given his first leave of absence in April 1865, he had won by gallant and meritorious services the brevet rank of lieutenant-colonel. All these facts are important as showing under what strenuous conditions his inherited character was strengthened and fixed along soldierly lines at an early age. The only adverse criticisms from reputable people which have been made against him came from those unable to appreciate the essential difference between military and civil ideas of promptness, activity and obedience to orders from a superior.

At the close of the war he took up the usual duties of an engineer officer in times of peace. In 1867 he was raised to captain, and five years later was made chief engineer of the Department of Dakota. From 1876 to 1882 he was assistant under Colonels Kurtz and Macomb, and then served about six months as engineer secretary of the Lighthouse Board. During these years of routine engineering service his scrupulous honesty, unusually attractive personality and engaging frankness of speech won the friendship of all public-spirited and broad-minded people with whom he came in contact, and eventually led to his receipt of the greatest compliment paid to an engineer officer since the Civil War.

In the winter of 1882-83 the people of Philadelphia rose in wrath against the officials of the city. Under the leadership of a committee of 100, so-called new officers were chosen, and an attempt made to improve the administration of public affairs. The water department particularly was the subject of

criticism, and there was an urgent demand for an intelligent executive engineer at its head. By a common impulse the committee turned to Captain Ludlow, who was widely known among the leading citizens. He agreed to accept the task if a leave of absence could be procured, so the committee appealed to Congress, then in session, and by a special Act, passed on February 28, 1883, secured his services for three years. Here his executive ability and freedom from the indirect methods of politicians soon reduced chaos to order, shiftlessness to business, and jobbery to clean administration. The problem of the extension of the waterworks was turned over to Mr. Rudolph Hering, with orders simply to find the best source for an additional supply, and in every other direction broad-gauge, earnest and intelligent work, with specialists' assistance, was done for the public service.

While holding this office an attempt to bribe him was made, which is now a well-known story, but is worth telling again as illustrating the cutting scorn he showed toward dishonesty in any form. A contractor called at his office, and during the conversation placed in a conspicuous place a bank note of large denomination. The talk continued quietly, and the contractor was offered a cigar from the commissioner's private box. Pleased at the success of his little deal he accepted with complacent self-esteem, which soon changed to fright when he was handed the bill, burning, to light the cigar.

When the three years at Philadelphia were finished, with much credit to himself and advantage to the city, Major Ludlow became engineer commissioner of the district of Colombia. Service for five years on the Lighthouse Board succeeded his term in Washington, and he then went to London as military attaché. While serving there he was called back to perform one of his most important public services, an examination of the Nicaragua Canal project, in which task he was associated with Messrs. M. T. Endicott and Alfred Noble. At this time everyone believed that the power over Congress of the Maritime Canal Company was so great that the country would be committed to its scheme without proper investigation. The Ludlow Commission stopped this absolutely by a report which is one of the most creditable examples of professional literature, produced under adverse conditions, that we have had in recent years.

Of his work in Cuba after the Spanish war so much was printed in the *Engineering Record* last year that it is unnecessary to review it here. Havana was a charnel house when he took charge of the city; it compared favourably with many cities in the United States when he left it. With his little staff of devoted officers and civilian assistants he fought the battle of cleanliness as valiantly as he had fought that of humanity, and faced the storm of abuse and filthy innuendo from the riffraff of the city with as little concern as the bullets of an enemy in arms. It was a grand achievement that was his, not generally recognised at its full importance in the States nor in the Cuban capital, but one which should be commemorated in enduring bronze in a conspicuous place in that city.

On his return to America he was commissioned to organise the Military War College, and for the purpose visited the headquarters of several European army departments. When the work was finished he was ordered to the Philippines, but consumption had seized him before he arrived out, and he was invalided home immediately. It was characteristic of the man that none of the usual hopefulness of the consumptive was shown by him. On the return voyage he discussed the disease calmly with the surgeon, talked over the quality of the creosote he was taking, and freely expressed a decision to die peacefully at home rather than among strangers in some distant sanitarium. And so he passed away as he wished, on August 30, in the home of a son-in-law. Honoured by the army, respected by those who respect what is just and true, loved by all who knew him well, he has left behind a record which may well be held up as a model for the American soldier.

CONGRESS ON TESTING AT BUDAPEST.

THE Congress of the International Association for Testing Materials was held at Budapest from September 9 to 14 under the presidency of Professor L. von Tetmajer, and was largely attended by engineers from all parts of the world. The delegates present included four from England, forty-one from Austria, three from Belgium, nine from Denmark, two from the United States, thirty-six from France, 152 from Hungary, seventy from Germany, three from Norway, twelve from Italy, twenty-six from Russia, one from Roumania, three from Spain, one from Servia, ten from Switzerland and five from Sweden. After an inaugural presidential address and address of welcome from the Hungarian authorities, a representative of each country was elected an honorary president of the congress, Mr. B. H. Brough being chosen for England, and Professor H. M. Howe for the United States. The other English and American members present were:—Sir William H. Bailey (Manchester), Mr.

Bertram Blount (London), Dr. C. J. Renshaw (Ashton-on-Mersey) and Dr. R. Moldenke (New York). In addition to the various reports of committees dealing with technical problems, the following papers dealing with metals were read and discussed:—"On the Measurement of Internal Tension," by Mr. Mesnager (Paris); "On the Forms of Carbon in Iron," by Baron Jüptner (Leoben); "On Brinell's Researches," by Mr. A. Wahlberg (Stockholm); "On the Testing of Metals by Means of Notched Bars," by Mr. H. Le Chatelier (Paris), by Mr. G. Charpy (Paris), and by Professor Bebelubsky (St. Petersburg); "On Micrographical Researches on the Deformation of Metals," by Mr. F. Osmond (Paris); "On Metallography," by Mr. E. Heyn (Charlottenburg); "On the Testing of Railway Material," by Mr. E. Vanderheyem (Lyons), and "On the International Iron and Steel Laboratory," by Professor H. Wedding (Berlin). Several papers dealing with stone and mortars were also read, and an interesting lecture on the iron industry of Hungary was delivered by Professor Edvi-Illes (Budapest).

TESSERÆ.

Roman Art.

WHEN the whole collective history of civilised man (with the exception of India) was concentrated in Rome, so likewise was that of art. But this was solely the result of the political supremacy of Rome, not of her artistical talent. The Romans, although intimately allied to the Greeks, were made of a sterner, harder and less finely organised stuff. Their minds were constantly turned toward those external relations of men by which their actions are generally regulated and determined (or, as we should say, to practical life); at first, more to those which regard the community (*i.e.* the political); afterwards, when freedom had perished, to those which concern individuals in their intercourse with each other, and especially to those grounded on the relation of men to worldly possessions. To maintain, to increase, to secure the *res familiaris*, was nowhere regarded so strongly in the light of a duty as here. The careless ease, the playful freedom of mind which, abandoning itself absolutely to internal impulses, gives birth to the arts, was a stranger to the Romans. Religion, too, in Greece the mother of art, was among the Romans, both in her earlier form of an emanation from Etruscan discipline, and in her later, when the deification of ethico-political ideas prevailed, systematically practical. This practical spirit was, however, connected in the Romans with a grandeur of mind which contemned everything petty and half-formed, which met all the necessities of life by vast and effective undertakings, and hence maintained the glory of at least one of the arts—architecture.

Religion and Art in Greece.

The Greeks were in a certain sense fortunate, that long before art had a visible existence, the genius of the people had prepared the way for the artist and had prefigured the whole world of art. That mystical element which is so essential a part of religion—in which we dimly conceive and feel the divine nature as infinite and absolutely different from the human—as incapable of all representation and the subject only of faint and imperfect suggestions—this element was not wholly excluded indeed—for that is impossible—but thrown into the background, especially by poetry. The ancient legends which describe the secret influences of the universal powers of nature had, even as early as the Homeric age, nearly lost all meaning to the Greeks; the festal rites which sprang from this root continued to be observed as venerable and traditional ceremonies; but poetry followed her inevitable course—to fashion everything after the analogy of human life; and with this a simple piety, which conceived the Deity as a human protector and counsellor, a father and friend in every time of need, was perfectly consistent. The bards, who were themselves only the organs of the universal sentiment, gradually rendered their descriptions more individual and precise, as we see that Homer did not attain to the same degree of sensible distinctness which characterised the poets of the most flourishing age of plastic art. When, however, plastic art had succeeded in representing the outward forms of life in all their truth and significance, there remained only for her to give substance to the ideal images which the imagination had already individualised. And although this could never be done without an entirely original conception, without inspiration, and an exertion of genius on the part of the artist, yet the general conception of the god entertained by the whole nation was there, and served as a criterion of the accuracy of the representation. If the established and distinct conception of the god, and the exquisite sense of the Greeks for the character of forms, were completely satisfied, a normal image arose, to which all succeeding artists conformed, though with the living freedom of genius, evincing that peculiar taste and judgment of the Hellenic nations, equally removed from Oriental stiffness and servility, and from the modern rage for originality, which

is the mere offspring of vanity. Statues of gods and heroes were produced which possessed not less internal truth and distinctness than if the gods and heroes had actually sat to the artists. This state of things the world has beheld but once, because it was only in Greece that art was the business of the nation.

The Architect and His Works.

With the higher order of artists we see the most striking proofs that man can least appropriate to himself that which most completely belongs to him. His works leave him as a bird the nest in which it was hatched. The lot of the architect is herein strange above all others. How often does he turn his whole mind and soul to the construction and perfecting of rooms from which he must be for ever shut out. The royal halls are indebted to him for a splendour the full effect of which he is never to enjoy. In the temple he fixes an impassable barrier between himself and the Holy of Holies. The steps which he has laid for the celebration of the heart-elevating mysteries he must never venture to ascend; as the goldsmith looks with distant reverence on the sacred chalice, to the gold and gems of which he has given shape and brilliancy. With the keys of the palace the architect delivers up to the rich man all its conveniences and enjoyments of which he is never to share in one. Must not this gradually estrange the art from the artist—that his work, like a full-grown child, no longer reflects its influence on its father? And how much would the art advance if it were occupied almost exclusively with the external, which belongs to all, and in common with all, to the artist himself.

Oolitic Limestone.

Oolitic limestones stretch across the country as escarpments or hills from Gloucestershire, where they form the Cotswolds, to Yorkshire, where they form the moors. A few seams of clay intervene, the chief being the fuller's earth. The limestones are richly fossiliferous, and, like the lias, may be divided into zones, each characterised by a particular ammonite. Ammonites, brachiopoda and corals are of frequent occurrence, with a vast number of other shells. The egg-like structure which gives these limestones their name of oolite, or roe-stones, from their resemblance to the roe of a fish, is a remarkable one. The grains consist of crystalline calcite, and in them can be observed both a radial and a concentric structure, arranged usually round a grain of sand, a fragment of a shell or some foreign body. By some this is supposed to have resulted from the deposit of carbonate of lime from solution in water round grains of sand and shell fragments drifting about between tide marks; by others the growth of calcite is supposed to be due to the action of a small organism which builds minute tubes of carbonate of lime. The similar but larger grains which occur in the pisolite or peagrit of the inferior oolite seem to be undoubtedly due to the growth of such an organism. Oolitic limestones not only occur in the lower oolites, but in the corallian rocks and in the Portland stone, so famous for building massive structures of Classic design like St. Paul's Cathedral. The inferior and great oolites also yield splendid building stones in Somerset, Gloucestershire and Lincolnshire which are much used for Gothic architecture.

"Theatrum Orbis Miraculum."

The Theatre of Parma is commonly supposed to have been the work of Palladio and finished by Bernini, but neither of them had the smallest share in it. Gio. Battista Magnani, an architect and engineer, and Leonello Spada, a painter, were employed by the Duke Ranuccio Farnese to construct and embellish that famous theatre. Its form is semicircular, to which are added two straight sides. Its length from the wall to the front of the stage is about 125 feet, and its breadth, reckoning from the wall behind the boxes, about 93 feet. Around the pit, which is about 48 feet broad, is erected on a basement, with balusters between the piers, a gradation of fourteen rows of seats, with two entrances at the sides and a large ducal balcony in the middle. Each entrance is furnished with a large winding staircase. Over these gradual seats are raised two stately boxes, one Doric and the other Ionic, each with a gradation of four rows of seats. The upper decoration of the boxes is sustained by enchased pillars, between which are arches supported by other pillars, smaller and insulated, which causes a confusion of appearance in the architecture and a great impediment to the view of the spectators who are in the boxes. A worse effect is produced by the two great lateral entrances which are between the seats and the stage, as the two orders with which they are ornamented, instead of uniting in the best manner, divide and rudely clash both with the theatre and with the stage. In the middle of the upper arch of these entrances, on a very high pedestal, is an equestrian statue, which seems determined to rush headlong to destroy all rules of propriety. Great projections and unmeaning arches hurt the stage and the orchestra. But the greatest inconvenience is in the front of the stage being excessively narrow and distant from the seats, whilst with the

greatest ease it might have been constructed wider and much nearer the spectators. From the aforesaid inconvenience and the above-mentioned strange figure of the theatre result this very great evil, that the spectators who are at the sides can see but a very small part of the stage; in compensation for which they hear surprisingly well, as the structure, whether by design or accident, is such that a person whispering in one part, another situated at the opposite side distinctly hears him. This great theatre has no external decoration, and by being such a length of time out of use is in such a ruinous state as scarcely to be visited without danger.

GENERAL.

M. Poilpot has received a commission from the French Government for a painting which will represent the arrival of the Czar at Dunkirk.

The Ancient House known as "The Hall-i-th'-Wood," Bolton, which had its origin in Tudor days, and which more than a century ago was the home of the Lancashire inventor, Samuel Crompton, has been judiciously restored, and is to be used as a public museum.

Mr. Lawrie, burgh engineer, has prepared plans for a fever hospital which is to be erected in Bo'ness at a cost of 6,000*l*.

The Committee for the collection and preservation of geological photographs received during the past year 240 examples, exactly the average for the past eleven years. It is proposed to publish three sets, the first of which will be issued shortly.

The British Association will meet next year in Belfast, under the presidency of Professor James Dewar, and for 1903 Southport has been selected.

The Late Mr. Herbert Richard Lloyd, aged thirty-nine, architect and surveyor, of Birmingham, who resided at Redditch, was accidentally poisoned on Thursday in last week. He had been suffering from illness, and was ordered to inhale carbolic acid. Mrs. Lloyd gave him a dose from the bottle containing the acid, and he died in great agony twenty minutes afterwards. The jury at the inquest returned a verdict of "Death by misadventure." He had a well-established business connection in Birmingham, and was architect of the Redditch Technical Schools, the recently-erected Redditch United Methodist Free church, and several other public buildings.

An Isolation Hospital is to be erected in Bexhill, and a design is to be obtained through a competition. The Urban Council have resolved that "the position of the hospital buildings be left to the competitors to deal with as they think best."

The Society of Arts announce that next year the six prizes for designs for household furniture, carpets, wall-papers and hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones, will be awarded.

The Autumn Art Exhibition in the Walker Art Gallery, Liverpool, was opened on Saturday. Among the paintings are M. Benjamin Constant's portrait of Queen Victoria, Mr. Holman Hunt's *Finding of the Saviour in the Temple* and Mr. Watts's *Slumber of the Ages*, besides works by forty-three members and associates of the Royal Academy.

The New Church in Dundee, which is a memorial of George Wishart, a forerunner of the Scottish Reformation, has been opened. It was designed by Mr. T. Martin Cappon.

In the Exhibition to be held next year at Cork, it has been decided to have an art gallery. The idea is to have a loan collection of Irish pictures up to the end of the last century. The project is excellent, and it is to be hoped that it will receive the support it deserves.

As a Memorial of the late Queen Victoria, a handsome chancel screen, richly carved in oak, has been erected in the parish church of St. Nicholas, Great Bookham. It has been dedicated by the Bishop of Winchester, and numbers among its subscribers nearly every resident in the parish.

The Marquis of Salisbury has subscribed 50*l*. towards the 2,200*l*. required to complete the restoration of St. Mary's Church, Charing Cross Road.

An Arbitration Case is now before Mr. G. F. Deacon, C.E., relating to a claim by Messrs. Holme & King, Liverpool, who constructed for the Merthyr Tydvil Urban District Council extensive waterworks at Neuadd, Breconshire. The amounts sought are for work done other than that provided for by contract, 6,744*l*. 18*s*. 6*d*., and for extra expenditure caused through the Council's delay, 23,427*l*. 3*s*. 9*d*.—total, 30,152*l*. 2*s*. 3*d*.

Mr. Douglas Strachan has completed the decoration of St. Machar's Church, Bucksburn, N.B. In the chancel are introduced four wall-paintings of the Adoration of the Magi, the Transfiguration, the Crucifixion and the Resurrection.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

SHEFFIELD.—Sept. 30.—Designs are invited for a Memorial to Her late Majesty, Queen Victoria, on the site now occupied by the monolith in Fargate, such Memorial to include a statue of Her late Majesty. Prizes of 100l., 50l. and 25l. respectively will be awarded to the three best of the unsuccessful competitors. Messrs. Wm. E. Clegg & George Franklin, honorary secretaries, Town Hall, Sheffield.

CONTRACTS OPEN.

ALDERSHOT.—Oct. 1.—For opening, filling and making good trenches for electric-light cables and mains. Mr. W. E. Foster, clerk to Urban District Council, Council Offices, Aldershot.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

BARKING.—Oct. 9.—For erection of an entrance-lodge, tool-house, building, and cart-shed at the recreation-ground, Longbridge Road, Barking, Essex. Mr. C. F. Dawson, surveyor, Public Offices, Barking.

BARNLEY.—Sept. 26.—For erection of five cottages in Stanley Road, Stairfoot. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

BARNSTAPLE.—Sept. 23.—For extension of the Imperial hotel. Mr. W. C. Oliver, architect, Bridge End, Barnstaple.

BERWICK-ON-TWEED.—Sept. 24.—For erection of a villa at Norham. Mr. J. L. Murray Sherrieff, East House, Norham.

BEXHILL.—Oct. 4.—For erection of coastguard buildings, consisting of houses for an officer and twelve men, boathouse, watchroom, &c. Contract particulars may be seen at the Coastguard station at Bexhill.

BIDEFORD.—Oct. 5.—For sewerage works in connection with the sewerage and disposal of the sewage of East-the-Water, Bideford. Mr. Baldwin Latham, Parliament Mansions, Victoria Street, Westminster.

BIRMINGHAM.—Oct. 8.—For erection of receiving wards, porter's lodge and new pavilion, stores and offices, workshop, at the workhouse, Selly Oak. Mr. Edwin Docker, clerk to the Guardians, 10 Newhall Street, Birmingham.

BRIGHTLINGSEA.—Sept. 24.—For alterations to the reading-room, Brightlingsea, Essex. Messrs. Start & Rowell, architects, Colchester.

BRISTOL.—Sept. 25.—For wiring of the Avonbank electric-lighting station. Mr. H. Faraday Proctor, city electrical engineer, Temple Back, Bristol.

BRISTOL.—Sept. 30.—For erection of an infants' school and special class centre at Wilson Street, St. Paul's. Messrs. Philip Munro & Son, architects, 6 St. Stephen's Chambers Baldwin Street, Bristol.

BROMLEY.—Sept. 24.—For alterations and additions to the mortuary buildings at the sick asylum at Devons Road, Bromley, Middlesex, E. Messrs. J. & S. F. Clarkson, architects, 136 High Street, Poplar, E.

CAMBORNE.—Oct. 1.—For erection of a dwelling-house at Barripper Road, Camborne, Cornwall. Mr. J. F. Pearce, Camborne.

CANNOCK.—Sept. 25.—For erection of entrance walls, with boundary wall and palisade, repairs to fences generally and alterations in the wards for fire exits at the workhouse. Mr. Ashton Veall, architect, Wolverhampton.

CARLISLE.—Sept. 25.—For erection of two houses in Norfolk Street. Mr. H. H. Hodgkinson, architect, 9 Lowther Street, Carlisle.

CARLISLE.—Sept. 25.—For erection of a Primitive Methodist church at Upperby, Carlisle. Mr. Isaac Longrigg, Lazonby, R.S.O.

CARLISLE.—Sept. 30.—For erection of four houses, Courtfield Gardens, Warwick Road, and two houses in Close Street. Messrs. Briggs Bros., Market Street, Carlisle.

CASTLEFORD.—Sept. 24.—For erection of houses in Globe Street. Messrs. Garside & Pennington, architects, Wesley Street, Castleford.

FRIEZE, THE CENTURY THEATRE.

CATHEDRAL SERIES.—CHICHESTER: NORTH AISLE
LOOKING WEST.

SALISBURY HOUSE, FINSBURY, E.C.

UNITARIAN CHURCH, BIRKENHEAD.

VARIETIES.

NEW chapel, erected on a spot adjacent to the post office in Barry Island, in connection with the Wesleyan denomination was opened last week. The cost of erection amounted to £1,000.

THE new mission church of St. Hilda, in the parish of St. James's, Latchford, Warrington, was opened on the 12th inst. The building has accommodation for about 350 persons, in addition to a reading-room and two vestries. The total amount expended on the land, building, fittings, &c., up to the present time is £367. 10s.

THE ancient parish church at Wingrave, Buckinghamshire, has been thoroughly restored. The tower has been restored to the base, and the structure has been raised by five yards to provide for an adequate ringing chamber and a clock chamber, and an entirely new turret has been built. The cost of the restoration has been about £6,000.

IN view of the steps which the Dover Corporation are taking to obtain an extension of the borough boundaries, the inhabitants of St. Margaret's Bay have sent a petition to the Corporation requesting that the neighbouring resort may be included in the application. Five-sixths of the ratepayers of St. Margaret's signed the memorial. The Overcliff scheme will connect Dover and St. Margaret's by a broad road over the cliffs, and several estates are already laid out. The proposed boundary scheme would double Dover's sea frontage.

THE Congregational church, Lewisham High Road, has been renovated and decorated throughout and the electric light installed. The stonework of the spire has been repointed in

cement and treated with a solution of "fluat," and a new lightning conductor fixed. The repairs and decoration have been carried out by Messrs. J. O. Collingwood & Co., Brockley, S.E., from the designs and under the superintendence of Messrs. G. & R. P. Baines, architects, 5 Clement's Inn, Strand, W.C., at a total cost of about £1,300.

THE Garden City Association has invited the London borough councils to appoint delegates to attend a conference at Birmingham and Bournville to-day to consider the experiment of Messrs. Cadbury in removing their works from Birmingham to Bournville, and the desirability and practicability of a combined movement of manufacturers and co-operators to new areas, so that new towns may be established on land to be purchased for the community. In this way, it is suggested, overcrowding in towns might be relieved and workmen provided with healthy homes in rural garden cities.

A NEW Board school which the Halifax School Board have erected at Sunnyside, in the north-west portion of the town, at a total cost of £22,500, was opened on the 16th inst. In the mixed department accommodation is provided for 350 boys and 350 girls. The infants' department, which forms a separate building, contains accommodation for 108 scholars. Belonging to the former department there is a gymnasium, a cooking kitchen and a manual instruction-room, fitted with fourteen benches. The school has been provided throughout with the electric light. There are also special rooms for the drying of the clothing of the scholars in wet weather.

AT a meeting of the Congleton Corporation held at the town hall last week the mayor (Councillor G. Pedley) reported that the borough surveyor and himself had called at the Local Government Board offices to endeavour to expedite matters in connection with the application of the Town Council for sanction to borrow £16,953 for the purposes of sewerage and sewage disposal, and the town clerk read a letter from the secretary of the Local Government Board, as a result of the interview, in which he stated that the Board were now satisfied that there was no risk of pollution of the water-supply by the construction of the proposed works, and that the Corporation's scheme of sewerage and sewage disposal was otherwise generally satisfactory, except as regarded the area of land proposed to be used for the treatment of the effluent from the secondary bacteria beds, the Board considering that an additional two acres should be acquired and laid out for the purpose indicated. It was resolved that the mayor, Councillor Carson and the

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light, and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

town clerk should see Sir Walter Shakerley's agent and endeavour to arrange for the purchase of additional land.

A MUNICIPAL technical college which the Sunderland Corporation has had erected, at a total cost of 27,000*l.*, was opened on the 16th inst. The building of this handsome structure was made possible by the action of the Government of 1890, which set apart what is known as the "whisky money" for the use of county and county borough councils for the purposes of technical education, and Mr. Storey recalled the circumstance that it was he who moved in the House of Commons the amendment which, though defeated by four votes, induced the then Chancellor of the Exchequer to thus allocate these funds. The proceedings were attended by all the local authorities, and many eminent professors at various universities. Towards the cost of the college the Corporation have provided the interest and sinking fund on the capital sum of 10,000*l.*, the estimated balance required. As at present equipped, the college will cost about 4,000*l.* per annum, and the technical education committee expect to receive sufficient from "whisky money," grants and fees to carry it on without any call upon the rates, though the Council have power to levy a rate of 1*d.* in the pound for the purpose.

ELECTRIC NOTES.

THE Wednesbury Corporation have requested Mr. Warden-Stevens, consulting engineer, of Westminster, to advise them regarding an electrical distribution undertaking. The Corporation a short time back obtained a provisional order entitling them to establish works for the supply of electricity, but at present it is proposed that the power shall be obtained in bulk from an adjoining local authority or from a power company.

FOR many reasons it is sometimes convenient to adopt alternating current circuits, but difficulties arise in connection with the lamps. The General Electric Company, Ltd., have after many experiments and tests produced an enclosed arc lamp which will be known as the "Angold." It possesses several advantages in being rainproof and weatherproof, having a peculiarly neat arrangement of the globe and a choking coil in the lamp case. No pumping is needed at starting, and the burning is absolutely steady and noiseless. The company have also perfected a balancing and other coils which can be used with the arc lamp.

WE mentioned last week that the Electric Lighting Board, Limited, of 7 Pall Mall, had executed a number of important commissions in connection with the Czar's visit to France, and telegrams to hand yesterday give particulars as to the extent of the work done through the company's French agents and contractors in the very short time available. The whole of the official electrical illuminations at Compiègne were done on the E. L. B. system to the exclusion of all other electrical work. The illumination devices alone carrying 12,000 lamps, whilst not less than 500 garlands of lights were also provided, and further, 3,000 yards of illuminated festoons. The whole of the official electrical illuminations on the Prefecture Buildings and the Town Hall at Dunkirk were done on this system, the illumination devices alone carrying 3,000 lamps. The Transatlantic liner, *La Gascogne*, was lit up on the same system, as well as one of the cruisers of the French fleet, the latter as an experiment for future illumination of the French men-of-war. A Paris innumerable decorative schemes were carried out for business firms on the E. L. B. system, but the most interesting was a design at the Orangery, in the Tuileries Garden involving 4,000 lamps.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester have just supplied their patent Manchester grates to the new Cottage Hospital, Abergavenny.

THE Shire Hall, Haverfordwest, has been fitted with improved low-pressure hot-water heating apparatus by Messrs John King Limited, engineers, Liverpool, who are employing their Rahnee radiators.

THE heating of the new museum, Albion Street, Hull, is to be by Spencer's patent "Ventilo" radiators, of which the patentee and sole maker is W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, E.C.

MR. JOHN LAIDLAW, of Dundas Street, Glasgow, informs us that the co-partnership carried on by the Messrs. Mirrlees, Watson & Co., engineers, and John Laidlaw, engineer, under the firm of Watson, Laidlaw & Co., engineers, in Glasgow, was dissolved on December 31, 1900, by mutual consent, and that he has taken as partners Mr. James Wright Macfarlane and Mr. Andrew Robert Robertson, who for a number of years past have been connected with the management of the business, of which he has acquired the whole assets and goodwill.

and which will continue to be carried on under the name of Watson, Laidlaw & Co.

THE "Empress" combination bath, recently introduced by Messrs. Wright, Sutcliffe & Son, of Halifax, is a light, rustless and strong bath made in tinned steel, tinned copper and aluminium. It requires no casing, can be decorated in any style, adapted to any kind of fittings, and every part is open and accessible. The patent "Empress" lavatories are made with basin, table top, patent standing waste-pipe, soap and rush trays in one piece of porcelain, with fittings for hot and cold water. These are so arranged that there is no brass plug or chain inside the basin. The waste-pipes and drain-holes are adjusted to give a quick discharge. The basins are made of the finest sanitary earthenware produced, and are supplied white, ivory, gilt, blue printed, or decorated in various styles.

BUILDING AND BUILDERS.

NEW Wesleyan chapel is to be erected at Coytrahen at a cost of 450/.

MEMORIAL-STONES of new Board schools were laid on the 14th inst. at Rise Carr, Darlington. The buildings are estimated to cost about 8,500/.

THE town clerk of Bridlington has received a letter from the Local Government Board sanctioning the borrowing of the extra 2,000/., making 8,000/., for the carrying out of the sewerage works.

A SITE for a crematorium has been secured at Golder's Green, Hendon, adjacent to the terminus of the proposed tube railway from Charing Cross to Hampstead. Extensive excavations and building operations have already commenced.

THE foundation-stone of St. George's chapel of ease, Clonliffe, which is to be built instead of the temporary building at Clonliffe, in St. George's parish, is to be laid on October 9.

THE Pudsey Town Council having decided to provide public baths, steps are being taken to get information as to the working of such baths in towns of similar size to Pudsey, and a special meeting will be called to deal with the question.

THE memorial-stones of the Walton Park Congregational church, which is in course of erection at a cost of 5,500/., in Rice Lane, Liverpool, were laid on the 14th inst. The

architects of the new building are Messrs. Briggs & Wolstenholme, and the builder Mr. W. Mather.

THE eighth annual convention organised by the National Association of Master House Painters and Decorators will be held at the Temperance Hall, Leicester, on Tuesday, Wednesday, Thursday and Friday, 1st, 2nd, 3rd and 4th prox.

PRINCESS HENRY OF BATTENBERG has expressed herself as in favour of the Solent tunnel scheme, and it is expected that Her Royal Highness will cut the first sod at Freshwater, a ceremony which is not likely to be much longer delayed.

THE six selected candidates for the office of clerk of works in connection with the erection of the new market hall for Leeds came before the markets committee on Monday, and Mr. James Reid, Glasgow, received the appointment at a salary of four guineas per week. The market hall, which will be built from plans prepared by Messrs. Leeming & Leeming, architects, will cost about 100,000/.

THE directors of St. Anne's (Lancs.) Land Company have decided to obtain powers to widen St. Anne's-on-the-Sea pier and erect a concert pavilion, for which 25,000/., new capital will be raised. Messrs. Garlick & Sykes, engineers, of Preston, have been instructed to proceed with the complete scheme at once. The pavilion, which will be of Oriental design, is estimated to seat 800 persons.

AT a special meeting of Bridlington Town Council a plan for the extension of the sea-wall, the construction of a marine drive and the erection of bandstand and shelters on the extension, was discussed for over two hours. At the close a resolution approving of the plan was defeated. The scheme was estimated to cost 35,000/., was prepared by Mr. Matthews, surveyor, and it was intended to call in Wagnall & Littlewoods, Manchester, to construct the pavilion on lines shown in the prize design of last year. The scheme will be further considered subsequently.

TENDERS have been accepted for the erection of a new covered market in the Main Street, Bingley, Yorks. The proposed structure will span the open space between two shops in the centre of the town, near to where the old market-house stood. The length of the new building will be 78 feet, from back to front 37 feet, and the height to the eaves 12 feet. It will abut on the Main Street, and will be open the full length at the front and walled at the back, save for 18 feet, to make a through road to the land at the rear. The building has been designed by the surveyor, Mr. H. Bottomley, and will be of a

neat but inexpensive style. In addition to serving the purpose for which it is intended, it will make an admirable shelter for the visitors to the town in wet weather.

THE memorial-stones of the new Wesleyan chapel which is being erected in High Street, Tisbury, Wilts, were laid on the 12th inst. The new chapel will be of Geometric Gothic architecture, and will accommodate 300 people. A schoolroom is also being built 40 feet by 20 feet with a movable partition, so that when necessary the two buildings can be thrown into one. Two vestries will be built and the entrance will be through a spacious porch with a tower 60 feet high above. The building will be of Tisbury stone with relief work and dressings of Bath stone. There will be an open varnished roof in the interior; the pews are to be of varnished red deal and the windows of tinted glass. The building will be heated with hot-water apparatus and will be lighted with gas pendant lamps. The total cost is estimated at 1,600*l*. The architect for the building is Mr. T. Wnacott, of Southsea, and the builder, Mr. F. Huish, Street.

A PUBLIC inquiry was held on the 11th inst. at the Wolverhampton town hall by Major C. E. Morton, inspector to the Local Government Board, respecting an application by the Town Council to borrow several sums amounting to 34,026*l*. for public improvements. Mr. H. Brevitt (town clerk) explained that the money was required for the purchase of Messrs. Harley's liquor vaults and other properties at the corner of Queen Square and Victoria Street to widen those thoroughfares. The Corporation had also bought the building at the corner of Cleveland Road and Bilston Street, hitherto a coffee-house, for the purposes of a branch police-station, and they had decided to extend the town hall buildings. The particulars of the different schemes having been furnished to the inspector, and there being no opposition, the proceedings ended.

IN a letter read at the Middlesbrough Ferry committee on Tuesday afternoon, Mr. Charles H. Gadsby, consulting engineer, Westminster, offered to supply a preliminary design and estimates for a proposed transporter bridge across the Tees at Middlesbrough, and in the event of the scheme being proceeded with and his being retained as engineer for its construction, he said he would agree to the fee counting as part of his ultimate remuneration. Referring to the Shields Bridge scheme, he said the Bill was thrown out by the Commons committee on the opposition of the Tyne Commis-

sioners, after an eight days' fight, chiefly on the ground that in case of war a foreign navy could knock the bridge down and so block the Tyne, which was the chief naval arsenal on the east coast. Councillor Ward proposed and Councillor Poole seconded that the offer of Mr. Gadsby be accepted. Alderman Scupham opposed on the ground that they would meet with opposition from Stockton, and after incurring considerable expense they would share the same fate with their Bill as the Shields promoters. The Chairman said they were differently situated. The Tyne Commissioners opposed the Shields scheme because they were partly owners of the Shields ferries; at Middlesbrough the ferries were owned by the Corporation. In reply to Dr. Hedley, the Chairman said their steam ferry-boats were old, and they would have to have new ones in the course of the next four or five years. The motion for the design and estimates as proposed was carried.

A MANIFESTO has been issued by the Hull Operative Building Trades Federation in relation to the strike of slaters in that city. The circular states that on August 6 a code of rules was posted in the Hull yards, which were said to be those agreed to by the representatives of the Yorkshire district on the one hand and the master slaters on the other, and in this code the Hull men were asked to accept the following conditions:—(1) $\frac{1}{2}$ d. per hour reduction on out-of-town work. (2) The abolition of extra pay for overtime when asked to work at night. Saturday afternoons, Sundays and Christmas days only to count as overtime. Saturday afternoons to be paid for as time and a half. Sundays and Christmas days as double time. (3) The introduction of labourers to do slate-holing, slate-pointing and to dress slates, whereas labourers in Hull have been content with carrying up the material required, and have never handled tools in any way. (4) That they shall leave the Hull Building Trades Federation (for this is what rule is really means), and thus lose the support of the other sections of the building industry in Hull, and practically become of no effect as a trade union. This, the Federation venture to think, is a large pill to be asked to swallow at one dose, and no one could wonder that the Hull men have struck work against such rules. The action of the E.C. in accepting such conditions, without even submitting the proposals to a vote of the members, and after promising that the rule relating to labourers should be deleted or qualified in the interests of the Hull men, is only surpassed by refusing these men financial support, and even going to the extent of advertising for unionists to take the place of the men out on strike. The Federation think that,

oking at both sides of the question, the Hull men have a just se, and it has therefore been decided to support them nancially as well as morally. They therefore ask that l slaters and tilers should be dissuaded from accepting nployment in Hull until the dispute is closed, and that ntributions should be obtained for the support of the men hilst they remain out on strike.

THE AUCTIONEERS' INSTITUTE.

HE members of the Auctioneers' Institute of the United ingdom have held their autumn meeting in Edinburgh this ar.

At the meeting of the Council, under the chairmanship of r. W. Bennett Rogers (London), Mr. J. A. H. Townsed reen, chairman of the finance committee, reported that after oviding for payment of all accounts to July 31 last there mained a substantial balance in hand, in addition to 2,700/. vested. The benevolent fund, which is a separate account, owed a balance at the bank of 2157/, in addition to invest- ents in Consols amounting to 950/. The report was con- sidered satisfactory and adopted. The general purposes com- mittee reported that the actual number of members of the nstitute was 1,337. A large number of applications for mission to the Institute were considered, when eighteen new llows, fifteen associates and one student were elected. In e evening the members and friends, numbering over 100, ined together in the Royal Hotel, Edinburgh.

PROPOSED ENCROACHMENT ON REGENT'S PARK.

CCORDING to Dr. J. Fletcher Little, member of the London ounty Council for East Marylebone, Lord Howard de Walden as laid a proposal before the London County Council and the Marylebone Borough Council which, if it is carried out, will nvolve a serious diminution of the air and space on the north ide of Regent's Park. His lordship is improving that portion f his estate called Portland Town, which abuts on the north- west side of Regent's Park. He asks to be allowed to advance ae building line on the forecourts in Albert Road from High treet (St. John's Wood) to Culworth Street to an extent arying from 10 feet to 26 feet on an average of 15 feet, and it

is understood that, should this be granted, a further demand will be made to continue the encroachment for a long distance further in the direction of Primrose Hill. The object in view is that there may be more room for the erection of blocks of residential flats in Albert Road overlooking Regent's Park. This scheme will take a large slice off the width of Albert Road, which, in its present state, is capable of being converted into a magnificent boulevard, and will cause a serious diminu- tion of the amenities of the park. This proposal has received the approval of the works committee of the Marylebone Borough Council.

PIETERMARITZBURG TOWN HALL.

THE new town hall, which was formally opened by the Duke of Cornwall and York, surpasses every building of the kind in the colony, not alone for the commodiousness of its interior, the number of offices it contains, and the ample accommoda- tion it offers to all municipal functions, but also for its design and the technical perfection of the plans on which it has been built. It is a very large building, extending 158 feet 11 inches on Commercial Road by 176 feet 11 inches on Church Street. It contains three storeys and a clock tower of 165 feet, fitted with four clock faces and a complete set of chimes. From outside the building dominates all its surroundings; it gives a fine and majestic finish to the centre of the town, and is in itself a magnificent structure, in all respects worthy of the capital of the colony.

At the main entrance on Commercial Road the portico extends beyond the pavement, and is pierced athwartships, as it were, by a double arch. The entrance is closed at the inner end of the portico by a sliding grille of wrought-iron. From this portal inwards one walks on a pavement of polished Italian marble. Just within the gate a tablet is inserted in the wall, marking the locality of the foundation-stone laid by the mayor. This stone was originally laid for the old hall by the Duke of Edinburgh, then Prince Alfred, in 1860.

Folding doors of glass and teakwood admit one into the vestibule, a fine hall supported on four pillars of Carrara marble. On the right another tablet catches the eye. It is a solid block of grey marble, sculptured to represent a mourning female figure weeping over the inscription that perpetuates the memory of those Natal Volunteers who fell in the war. Above is a scroll bearing the arms of Natal.

EMBOSSSED, GLAZED,
PRINTED, PAINTED,
MOSAIC & ENCAUSTIC.

MOSAIC & C.

AW & CO. will forward their Pattern Books, or Special Designs, with Estimates for every od of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,
Messrs. W. B. SIMPSON & SONS, 97 & 99 St. Martin's Lane, W.C.

The walls of the vestibule are marble faced to a height of eight feet or so, and are surmounted with a frieze in a foliage design. The door of the main hall is at the end. Between the two pillars on the right the grand staircase ascends to the first storey, from which the gallery of the main hall is reached.

On ascending the staircase is seen a stained-glass window 16 feet in height. The staircase is polished marble underfoot; the balustrade is of worked iron with a hardwood rail. There is a landing half-way up before the first storey is reached.

On the first floor the landing is bounded on one side by the main hall, and on the other by a broad balcony running out over the portion. Large glass doors, arched, admit daylight, and a corridor leads on either side to the numerous rooms and offices.

On the right are the banqueting-room and the council chamber, two fine, well-lighted apartments looking out on to the Market Square and Longmarket Street. The former is a spacious chamber, with barrel ceiling and windows rather high above the floor. The council chamber is rather smaller than the other, and its ceiling is pierced in the centre with a dome-shaped skylight. At the end of the corridor, behind the council chamber, is a staircase leading up from a side entrance to the hall. The corridors are lofty and 9 feet wide, lighted from above by electric lamps.

On the other side of the main hall on the first floor are numerous spacious offices, some opening on to balconies, and all planned to accord exactly with the idea that dominates the architecture of the whole structure. The entrance to the clock-tower is on this floor.

The third floor contains offices.

The main hall is best viewed as a whole from the gallery, to which access is obtained by eight doors on the first floor, corresponding to eight others on the lower floor. These doors are of teak and ground glass, with brass fittings. The broad, sloping gallery runs round three sides of the hall, with four tiers of folding chairs so arranged as to comfortably seat 460 persons, and allow each one easy access to his seat. The walls are alternately panels and columns, the latter of the Corinthian type, with moulded capitals. A broad cornice runs round the wall near the ceiling, and above it are stained lead-lights. The gallery is supported on cantilevers, thus obviating the use of pillars and allowing a clear floor to the hall below. The dimensions of the hall are 127 feet 6 inches in length by 60 feet in breadth by 54 feet in height. The hall is lighted at night by sun-lights.

The floor of the hall is of narrow oak boards, 3 inches in breadth by 1½ inches in depth. Thick pads of india-rubber intervene betwixt the planking and the girders on which they rest. The seating capacity of the floor has not yet been tested but at a moderate estimate at least 800 people could be comfortably accommodated on the lower floor, beside the 460 in the gallery.

The choir-gallery, with its orchestra platform and the organ are opposite the chief entrance to the hall. The choir gallery has nine rises, to seat some 150 persons. The platform is 10 feet wide, but a movable front enables this to be increased by 5 feet. The steps up to the platform are on either side, but for the purposes of the function a special front stair has been erected.

The architect is Mr. Street Wilson and the contractors Messrs. Mowat & Still. The clerk of the works was Mr. H. Light.

RED-GUM PAVING BLOCKS.

THE following report has been addressed to the agent for the West Australian Government by Mr. Herbert Stone, an expert who is engaged under instructions from the Colonial Office in investigating the commercial woods of the Empire:—

To the Hon. H. B. Lefroy.

Sir,—I have pleasure in reporting upon my visit with you on September 2 to the various places where Alcott's red-gum paving blocks have been, or are now being laid.

As regards the former, I consider that the length of time, viz. two years nine months, the longest record red-gum paving can show in London, is far too short to afford a basis for an opinion upon its merits.

In the experimental areas at Bridge Street, Westminster, laid two years ago, it has worn well compared with the neighbouring white oak and deal, but does not present the even surface of the doweled jarrah paving, especially on the west side of the road. With the exception of some unevenness in the middle of the road, where, I understand, a change in the system of laying was made, the surface of the jarrah is perfectly good. The soft wood (deal) compares rather badly here, as it has worn sufficiently for a channel across the road to be noticeable adjoining the jarrah, upon which the traffic impinges with great severity without producing much impression. All the four kinds of paving may be said to be in good condition.

BLACKFRIARS WORKS, MANCHESTER.

The paving at the Post Office, Charing Cross, where jarrah and red gum are laid together, appears to favour red gum, as so do the three strips of red gum, karri and white oak in Piccadilly Circus. In the latter case the white oak has suffered severely, but if the positions of the woods had been reversed I imagine that the pavement would wear in precisely the same places, as the destructive action of the starting of the omnibuses must be the severest test possible. The contrast is not pronounced in the middle of the road where the traffic is uniform.

In Waterloo Place jarrah and red gum again adjoin. The former has been down for two years and the latter since last November. With the exception of one or two depressions where the two woods meet the jarrah is in the better condition of the two. At the back of the statue the red-gum wood is covered with green algae, which are not injurious in themselves, but testify to the absorbent nature of the wood.

The karri paving in East Pall Mall is bad, and was evidently laid with unseasoned wood. The blocks have cracked and gaped widely, but show few, if any, cracks and little evidence of wear.

The blocks of red gum now being laid in Whitehall were carefully examined, and whatever durability the best selected blocks may possess those now being used are quite unfit for street paving or any other purpose. Although the number of blocks is extremely large, I am of opinion that 90 per cent. of those laid at the time of my visit should not have been passed—firstly, on account of the large quantity of sapwood (unripe wood); secondly, because of the wet and unseasoned condition of many of the blocks. A large proportion of these have been cut from young stuff, *i.e.* small trees in which the wood has not commenced to mature. The characteristic durability of woods belongs to the mature wood alone, the sapwood being perishable to a much greater degree. The worst feature, however, is the wet condition of the great proportion of the blocks, which can be clearly seen when one is cleft in two.

I understand that, on the attention of Mr. Alcott's representative being called to this, he stated that the moisture was due to the "gum." That this is not the case is obvious on comparing a wet block with a dry one, which is readily done as the laying proceeds. The practice of the men is to pick up the blocks with the tip of an axe, which compresses the wood and squeezes some of the moisture to the surface on each side of the cut. A dry block simply shows the clean cut. In addition, the "gum" does not saturate the tissue of the wood

uniformly, but is secreted in minute globules in the vessels or pores, and which give the wood its frosted or sparkling appearance on a cleft or plain surface.

A piece of a block (a portion of one cleft by one of the workmen) exposed a surface wet enough to moisten the fingers. It became apparently dry in the course of half an hour. Its weight on the evening of the same day was 11.7 oz. After drying at a temperature near, but below boiling point, it has lost 3.92 oz., or 33½ per cent. of its original weight.

There are wormholes in this specimen, which is partly sapwood and partly heartwood.

No user of wood would employ timber in this condition for any purpose whatever, and unless allowed to dry naturally before sealing up it must naturally decay. The blocks at Whitehall will require at least nine months' seasoning before they will be fit for use, even if otherwise suitable.

The manufacture of the blocks has been carelessly done, as they are irregular in size. Apart from those already rejected from this cause, those now laid vary as much as 1 inch in length and ¼ inch in breadth.

I am of the opinion that the pavements laid in the experimental areas above mentioned were selected blocks of mature wood similar to the sample block sent me by Mr. Alcott in December last. Careful search amongst those laid in Whitehall did not reveal more than one block equal to this in density and ripeness. The durability of this wood will be over-rated if the experimental areas be taken as a standard.

The specimen block alluded to was received by me on December 5, 1900, and, though apparently seasoned, became rapidly covered with mould on the end of the grain. Wishing to avoid error, I removed it to a drier location, after planing the surface clean, when the mould appeared again. The block was on each occasion placed with the end of the grain (where the annual rings appear) in contact with the desk, but was otherwise ventilated all round. It was upon this lower surface that the mould appeared. This, I consider, in connection with the green growth on the pavement at the back of the statue in Waterloo Place, to be evidence that the wood is appropriate pabulum for vegetable parasites. Further, the block, which was quite rectangular when received, has sunk on three sides.

The specimen taken on September 2 weighs, when dry, 39 lbs. per cubic foot.

To sum up, my conclusions are:—

1. That the blocks being used at Whitehall are not of the same quality by far as those used in the experimental strips.

2. That whatever durability the best of the mature wood may possess when sound and properly seasoned, it is valueless in the condition in which it is being supplied at Whitehall.

3. That as the mature sample supplied to me by Mr. Alcott shows the liability of the wood to the attacks of vegetable parasites, the wet and sappy wood must be liable to a much greater degree.

4. That the blocks laid will open in a multitude of cracks when exposed to the sun in a similar way to those at the back of the statue in Waterloo Place, and each crack will admit moisture and become a focus of decay.

All this ignoring the blocks already rejected for more obvious defects—I have the honour to be, your obedient servant,

Little Hay House, near Lichfield:
September 4.

PROPOSED NEW ISOLATION HOSPITALS FOR LANCASHIRE.

A LOCAL Government Board inquiry was held at the Manchester assize courts last week by Mr. W. W. E. Fletcher, M.B., into the application made to the Board for sanction to the borrowing by the Lancashire County Council of the sum of 16,000*l.* for the provision of an infectious hospital by the Horwich, Westhoughton and Blackrod joint hospital committee, to be erected at Fall Birch, on the north side of Chorley New Road. There were present at the inquiry, which was held in the grand jury room, Messrs. John Unsworth (chairman of the hospital committee), Herbert Barker, James Howarth and William Pilkington (members of the committee); Mr. J. P. Muspratt (deputy clerk to the County Council), Dr. Sergeant (county medical officer of health), Dr. G. H. Whitaker (medical officer to the Horwich District Council), Mr. J. B. Crompton (vendor of the land), Mr. P. M. Crompton (solicitor to the vendor), Mr. Thomas Partington (clerk to the hospital committee) and Mr. C. Cressey (Messrs. Cressey & Keighley, architects, Horwich and Morecambe). The inspector asked if there was any opposition to the proposed scheme, and Dr. Sergeant replied that there was not the least, the desire being that it should be proceeded with as rapidly as possible. The inquiry then resolved itself into an examination of the plans and the various details in connection with the new hospital.

The following details were supplied as to population, rateable value, &c. :—

	Population.	Rateable Value.	Amount of Rate <i>rd.</i> in the <i>l.</i>
Horwich . . .	15,083	57,600	235
Westhoughton . . .	14,377	64,726	259
Blackrod . . .	3,871	17,444	68

It was stated that the building, which is expected to cost about 16,000*l.* exclusive of site, will consist of five buildings in all, accommodating twenty-two beds for scarlet fever patients, twelve for typhoid sufferers and six for diphtheria cases. There will be an administrative block three storeys in height, and a laundry equipped with the usual disinfecting chambers and apparatus. The style of architecture will be English Renaissance, and the materials brick with stone dressings and green slate roof. The buildings will be ranged on each side of a central avenue. The cost per bed will be 430*l.* (with site), as compared with 306*l.* at Farnworth, which has thirty-two beds. Tenders will be advertised for in about a month hence. The inspector, among other matters, referred to the size of the ten bedrooms, and said that if they were intended for single bedrooms they were very large.

Mr. Unsworth said they were not, except in the first instance.

The inspector said trained nurses objected to sharing rooms. The inspector asked for an undertaking that smallpox cases would not be dealt with in the institution, and it was given. He then examined the plans in detail, and expressed his satisfaction with them.

Later in the week Mr. Fletcher concluded an inquiry at the county offices, Preston, into the application of the Lancashire Council to lend 15,000*l.* to the Preston, Fulwood and Longridge Joint Hospital District for the construction on a site behind Fulwood Barracks of an isolation hospital for infectious diseases.

Mr. Clarke, clerk to the joint hospital committee, stated that the original site at Pinfold was abandoned owing to its unsuitability, the present site being selected on the recommendation of the county medical officer of health. The new site effected a saving to the committee of 1,500*l.*

The inspector thought the present site, having been purchased out of a loan, ought to have been the subject of an inquiry. If the County Council had applied to the Local Government Board for power to lend the money, he did not think the Board would have given their sanction without an inquiry as to the

tness of the site, which investigation would have given residents an opportunity of objecting. He would have to raise the point, and leave it with the Board to decide.

SEWAGE AND BACTERIA BEDS.

A PAPER by Professor E. A. Letts, D.Sc., Ph.D., and Mr. R. F. Blake, F.C.S., F.I.C., on "The Chemical and Biological Changes occurring during the Treatment of Sewage by the so-called Bacteria Beds," was read at Glasgow. It was, he said, generally assumed that the so-called "bacteria beds" acted as oxidising agencies, absorbing oxygen from the air during their periods of rest, and subsequently transferring it to the constituents of the sewage when the beds were filled with this latter, the transfer being effected by micro-organisms which had established themselves on the surface of the material with which the beds were filled. It also appeared to be generally taken for granted that the micro-organisms mainly concerned in the purification process were the nitrifying organisms. Hence if these views were correct, the effluent from the bacteria beds should contain nitrates and nitrites equivalent in amount to the unoxidised nitrogen which disappeared during the treatment. But on examining the results obtained by chemists in investigation on sewage purification it would be found that comparatively small amounts of nitrate and nitrite were produced in relation to the unoxidised nitrogen disappearing. From results obtained in Manchester, Sutton and Leeds it was found that the nitrogen disappearing as "free" or "albuminoid" ammonia was 1.634, 7.185 and 1.528 grains per gallon respectively, while the nitrogen found in the effluent as nitrate or nitrite after double contact with the bacteria beds was 0.636, 1.100 and 0.11 grain per gallon respectively, showing that the percentages of nitrogen disappearing were respectively 39, 15 and 7. It was quite evident, therefore, that a considerable portion, and in most cases the greater part, of the unoxidised nitrogen which disappeared must be got rid of in some other form, and the question arose as to how this might occur. In all probability there were two—and only two—alternative ways in which the nitrogen could be lost, viz.:—(1) It might escape in the gaseous state as free nitrogen, or possibly as oxides of nitrogen; (2) it might pass into the tissues of animals or vegetables, the former of which might escape from the bacteria beds, and the latter (and possibly the former also) might remain permanently in the beds. In other words, there might be either

a chemical or a biological explanation, or both together. In an investigation on the effects of double contact with bacteria beds on screened and settled sewage the authors made analyses of the dissolved gases present, both in the original sewage and in the effluent from both beds, the samples being collected in such a manner that they did not come into contact with the air. The general results of these analyses were as follows:—(1) Practically no oxygen was present either in the sewage or effluents; (2) the effluent from first contact always contained considerably more carbonic anhydride than the original sewage, and with two exceptions the effluent from second contact also contained an excess of that gas; (3) in eleven out of twelve series of analyses the quantity of nitrogen in the effluent was in excess of that present in the original sewage, and, generally speaking, it was in larger excess in the effluent from double contact than in that from single contact. As the first six series of analyses only were made under exactly the same conditions the authors found that, taking them as the basis of calculation, on the average the excess of nitrogen in the effluent from second contact over that present in the sewage amounted in weight to 0.272 part per 100,000, while the loss of unoxidised nitrogen which had occurred in the sewage (by Kjeldahl's process) amounted to 2.2 parts, or that 12 per cent. of the nitrogen lost from the sewage during purification was thus accounted for, while in one particular case it amounted to 31 per cent. In all probability only a fraction of the free nitrogen actually evolved would be retained by the effluent, the rest escaping into the air. As regards the possibility that nitrogen was lost biologically—i.e. was absorbed into the tissues of animals or plants which feed on the sewage—there could be no doubt that a portion did escape in that way. The bacteria beds at Belfast and elsewhere swarmed with minute insects (*Podura aquatica*). These, escaping in myriads, often formed a thick layer on the surface of the effluent, which looked like soot. There could be no question that in thus escaping these animals carried with them some of the nitrogenous constituents of the sewage which they had devoured, but as yet the authors had formed no estimate of the quantity so removed. There were also species of worms always present in the bacteria beds in considerable numbers, which no doubt also fed on the sewage.

Professor Glaister said that he had been taking an interest in the Barrhead installation of bacteriological treatment of sewage, and he must confess that those results of Professor

Letts had been somewhat staggering. He had not found exactly the same results as Professor Letts had, but he had noticed that depending upon the age, and therefore the efficiency of the bacteria beds, you got different proportions of nitrogen in the fluids and the effluents. So long as the age of the bed was of importance, so long would any investigation of nitrogen at the inlet and the outlet be somewhat unsatisfactory.

Dr. S. Rideal said he believed that the main portion of this black-soot-like substance to which Professor Letts had referred was not living at all, but dead, inert nitrogenous matter which was formed in the breaking-down of the organic nitrogenous substance of sewage, and contained, roughly, 7 per cent. of nitrogen. He pointed out that the loss of nitrogen in bacteria beds, which was not accounted for by the cover formed, and gaseous nitrogen evolved was in part due to a black humus substance allied to peat, which, he had found, was formed in all the different methods of bacterial disposal which he had examined. This substance contained 7 per cent. of nitrogen, and was very stable, so that it did not decompose or give rise to any smell even if it was broken.

THE CRITICAL POINT IN ROLLED STEEL JOISTS.

A PAPER was read by Mr. E. J. Edwards in the section of engineering at the meeting of the British Association.

In selecting rolled steel joists for floors there are two elements which determine the section to be used with a given load per square foot of floor area. First, the stress per square inch produced by the load. Second, the deflection produced by the same load. At first, particularly with small spans, it is the stress per square inch which is the governing element; this stress must not exceed safe working limits. As the floor span is increased the deflection becomes the ruling element, the stress per square inch falling into the background. The deflection must not be sufficient to crack the ceiling where there is one, nor sufficient to be unsightly where there is none.

In the diagrams exhibited two curves were shown, one in black and the other in red. The former is the curve of a given maximum stress, and shows the loads a steel joist will carry for various spans. The red curve gives the loads which produces a deflection which is a constant given fraction of the span, viz. 1-200. The curves cross each other, and the point of crossing the author calls the critical point. At this point the

distributed load produces the given stress and given deflection. Before the critical point is reached the load produces the specified stress, but is insufficient to produce the limiting deflection; after the critical point is passed the distributed load produces the specified deflection, but is insufficient to produce the specified stress; in other words, the limit of deflection is reached before the limit of stress. Examples are given of various sizes of steel joists with the limiting stresses and deflections.

Generalising, up to the critical point the stress curve is the more important; beyond this the deflection curve is more important. The two important parts of the curves taken together are called the curve of loads, which is a curve with a kink in it. The first part of curve is drawn from the formula

$$W = \frac{128 I}{9 L d} \text{ and the second part from the formula } W = \frac{32 I}{L^2}$$

Explanations showing how the equations are arrived at are given in the paper. With a factor of safety of 3 and a breaking stress of 32 tons per square inch, and a deflection of 1-200 span, the critical point is at a span of twenty-seven times the depth. For this particular deflection it is shown that the factor of safety multiplied by 9 gives the critical point.

If the deflection in percentages of the span are calculated a series of curves of deflection can be plotted. At 1 ton per square inch and 1 per cent. of deflection the critical point is 576, the depth at 2 per cent. of deflection, the critical point is 288 times the depth, or 9×32 . As at 1 ton per square inch, 32 is the factor of safety. The values were tabulated and shown graphically by diagrams.

Returning to the special object of the paper, the selecting of rolled steel joists for fireproof floors, the principal step is to determine the pitch or spacing apart of the joists. These pitches are tabulated for various sections of joists for the loads of 1 cwt. and $1\frac{1}{2}$ cwt. per square foot of floor. A formula is deduced for a loading of 1 cwt. per square foot:

$$p = \frac{20 W}{L}, \text{ and for any other loading } p_x = \frac{p}{x}, \text{ where } x \text{ is the cwt.}$$

of load per square foot, p = pitch in feet, L = span in feet, and W = distributed load in tons, the rolled steel joist will carry safely. A final result is that the pitch varies inversely as the square of the span when the stress per square inch is considered, i.e. up to the critical point, and varies inversely as the cube of the span when the deflection is considered, or beyond the critical point.

2 GOLD MEDALS PARIS EXHIBITION, 1900

The Architect.

THE WEEK.

WHEN the project of a cathedral in Liverpool assumed some consistency, and a definite site was suggested, we offered a few remarks about the design for the contemplated building. We maintained that the case should be treated without any reference to the former project, which was a failure. When a cathedral was contemplated on a site near St. George's Hall, the intention was to dominate that building as much as possible, in order to make it plain to all Liverpool that the Church was supreme in the city. There is no doubt that one of the causes of the collapse of the scheme arose from the recognition of that intention. It would then be unfitting that any design which was produced to meet the circumstances of that unlucky case should be furbished up and made to serve for a building on a site of a different character, and where there was no secular building to be overawed. What we said gave offence to some of our readers. There is an effort to rule the profession of architecture through organised cliques, and one at least of them assumed that they could dictate to the cathedral committee the appointment of an auxiliary as architect. The efforts which were tried to make it appear that only one design was eligible, and that under no circumstances could another approaching it in merit be produced, were a revelation of the system which is now in force, and through which the interests of architects in general are sacrificed for the benefit of a few. It will be seen from the articles which we reprint this week from the *Liverpool Courier*, the leading journal in that city, that the selfish attempts have been frustrated, and that a design is likely to be obtained in the customary and most legitimate way. Not one of the designs produced in the last competition was sufficiently beautiful to induce the Liverpool people to make the least sacrifice for its realisation, and it would be absurd to believe that any of them would be more attractive now.

THE cathedral of Rheims must have a peculiar interest for sovereigns of all countries, for, like our Westminster Abbey, it has witnessed many coronations. It was in a predecessor of the existing building that St. REMI baptized CLOVIS and his warriors, and it was consequently the cradle of catholicism in France. In 401 a cathedral was built, but it was supplanted by one erected in 846 under the direction of ROMUALD, the architect. That building was destroyed by fire in 1210. The plans of the present edifice were prepared by ROBERT DE COUCY. Everyone knows the beautiful effect of the interior, especially towards the decline of day, when the light passes through the stained-glass windows and produces a chromatic charm which words fail to express. When the Emperor of RUSSIA visited the building on Thursday in last week the afternoon reflections had vanished and the interior was allowed to be unilluminated except by the lamp of the sanctuary. When Cardinal LANGÉNIEUX conducted the CZAR and CZARINA within the building the darkness was suddenly transformed into a blaze of light by electric power. This was a theatrical effect which was not suited to a cathedral, but it was characteristic of French ideas. At the same time a march of GOUNOD was sounded. Apparently the contents of the cathedral treasury were as interesting to the Imperial visitors as the building itself. Among the objects preserved, the three copes which were worn at the coronation of LOUIS XIV., LOUIS XVI. and CHARLES X. appeared to exercise most attraction.

AT Engelholm, on the west coast of Sweden, Professor MONTELIUS, of Stockholm, has revealed three ancient graves. One is supposed to be about forty centuries old, and has the characteristics of the Stone Period. The body it contained had almost entirely mouldered, but beside the remains was a flint weapon. The later graves, which were placed above the lower one, belonged to the Bronze Period, but the covering, which was a large stone, was derived from the earlier grave. In one of them a bronze dagger was found, and in the other a bronze sword enveloped in bark, which, however, fell in pieces when it

was taken up for removal. It is believed the two weapons date from about twelve centuries before our era. In the vicinity three graves were afterwards explored, also belonging to the Bronze Period, but of a later date. They are all supposed to have been the burial-places of Huns, and to mark a place of observation near the earliest colony of the invaders.

THE examinations of the Surveyors' Institution have imparted an impetus to the revival of land surveying. The maps of the Ordnance Survey were generally thought to have given the ancient science its quietus, at least as regards the measurement of estates. Railway surveying was a modern variety, and as it was unknown to the old Egyptians and mainly depends on optical instruments, some would say it had no right to be regarded as surveying. The Surveyors' Institution does not apparently attach much value to trigonometrical surveys, and we believe a student could pass the examinations without having once taken an observation through a theodolite. The latest treatise on the subject, entitled "Land Surveying: its Theory and Practice," by SAMUEL SKRIMSHIRE, F.S.I. (London: F. P. WILSON), professes in the author's words "(1) To supply in a handy and accessible form the exact knowledge required by candidates for the professional certificates; and (2) to give the necessary information in such an order that the work may form a clear and easy book of reference on the whole subject to the busy practical man." The aim of the author is therefore modest; the book mainly relates to work with a chain, and to such levelling as would be required in dealing with a building site. The instructions are given in simple language and are amply illustrated by diagrams. From what is said about instruments it is not necessary to have a separate treatise on the subject, and for all the purposes required by the Surveyors' Institution we have no doubt Mr. SKRIMSHIRE'S treatise is adequate. One piece of advice should be borne in mind in all offices where good drawings are prized, viz., "avoid stencil plates in the case of all except unimportant work." The words will show the care taken by the author with all varieties of routine.

THE late CHARLES JAMES RICHARDSON, who died in 1871, produced several books, and for a time they were referred to as authorities on Elizabethan and Jacobean architecture. He prepared designs for gates, ceilings and other works for manufacturers who were connected with building. He was a link between the time of SOANE and the new era. But he was too devoted to his art to become wealthy, and was unable to enrich his family. His daughter, Mrs. ADA GILES, is now an applicant for assistance from the Architects' Benevolent Fund. She is largely dependent for the support of her children on music lessons, but her piano has had to be pawned, and she appeals for aid to redeem it before all her pupils are lost. The case is a sad one, and if all our readers who have used Mr. RICHARDSON'S books would contribute a shilling or two, it would remove a great anxiety from his daughter. The committee of the Architects' Benevolent Fund will, no doubt, do all they can with the help of resources on which there are unhappily many demands.

It was generally considered that ARY SCHEFFER as a painter had lost all interest for Frenchmen. His name suggested his Germanic origin, and he was the favourite painter of the family of LOUIS PHILIPPE. Few care to recall that he was the painter of *Christ, the Consoler*, and *Christ, the Avenger*, which at one time were accepted as incarnations of the religious spirit in art. His name has, however, been revived by the presentation of some of his portraits to the Versailles Musée. The subjects will recall the variety of friends possessed by ARY SCHEFFER. They represent M. and Mme. DE BARANTE, who were notabilities in the political world; General CAVAIGNAC, who gained a reputation in Algiers and who was for a very brief period President of the Republic; HORACE VERNET, the military painter; TAGLIONI, the danseuse, and GOUNOD, the composer. SCHEFFER'S greatest defect was his indifference to colour. The Paris wits used to say he employed only snuff and green soap in making up his palette, and his portraits are not exempt from the artist's weakness.

IRISH PAINTERS.

AN appeal has been issued by Mr. A. HILL, architect, as secretary for the Fine Arts Committee, requesting owners of pictures by Irish artists to lend them for exhibition in Cork. It can hardly be expected that the display will equal what is seen in Glasgow, but there is little doubt that good examples of the painter's art would be appreciated in the Munster capital. That reason alone should be a sufficient recommendation of Mr. HILL's effort to increase the interest of the Exhibition of 1902.

The question has, however, been asked by many lovers of painting, Who were the Irish artists whose works are considered to be worth sending to their own country? There is no Irish painter at the present time who is an Academician or an Associate of the Academy. What is more remarkable, it is very rarely a picture is to be seen in Burlington House which has come from any Irish studio. In some of the late exhibitions Irish skill was represented by no more than one or two portraits. It is, therefore, pardonable if English amateurs should imagine that Ireland is at present without artists, and that in past years they were also absent. Further inquiry would establish the fact that although there is a Royal Hibernian Academy it is in a moribund condition, and the usual conclusion in such a case is that the failure must be owing to the inability of the members to produce attractive works.

Ireland has produced artists who, under favourable conditions, would probably have executed works deserving of comparison with those by natives of other parts of Great Britain. There is no reason against such a conclusion. It is impossible to discover through what conditions, artists appear in any country, for they may belong to the humblest classes; but as nature is fairly impartial it would be erroneous to believe there is any obstacle in Ireland which would make that country excluded from arrangements which are accepted as being universal. It is more just to conclude that the germs of art appear in the island, but as circumstances are not propitious to them they never attain their full growth. All that GRAY the poet has said about the waste of genius when it appears like a gem in unfathomed ocean caverns, or a fragrant flower in a desert, is as applicable to Ireland as to the village of Stoke Pogis.

It will be replied that art has flourished in countries where the surroundings were as unfavourable as in Ireland. SYDNEY SMITH showed acumen when he proposed as a motto for the *Edinburgh Review* a sentence of his own, which although in Latin announced that he and his fellow-contributors cultivated literature on a little oatmeal. He knew that Scotsmen and, indeed, all sensible people would be consequently more appreciative of what was written than if he had said the articles in the Review were to be composed by aristocrats for aristocrats. Scottish artists do not profess to spring from a higher class of men than JEFFREY'S writers, but already they have created a school. Their works win approbation in every continental exhibition, and examples are purchased by foreign Governments as permanent adornments of foreign galleries.

If we ask what is the difference between Ireland and Scotland, we find in the first place that the Scottish painters know they are living among men who are honestly sympathetic, and who are willing to expend money in the purchase of pictures. In Ireland there is a more effusive sympathy, but it begins and ends in words. The total sum laid out on the purchase of works from an exhibition of the Hibernian Academy is far less than is sometimes given for a single water-colour drawing in Edinburgh or Glasgow. The Irish painter soon learns the value of the praise he receives, and the prospect of the patronage which awaits him is enough to deprive him of all delight in his art. The verbose admiration of which he may be the subject is only a mockery, and he must feel it would be as advantageous for him to be applauded by chattering apes.

The experience which so many undergo, for in Ireland as elsewhere art will always have its deluded victims, corresponds with what is known about the relations between artists and the Irish people for more than a century. No Irish artists were ever successful unless they emigrated to another country. The greatest among all modern Irishmen, EDMUND BURKE, with his keen insight realised that fact as if it were a natural law. He was not satisfied with

talking and writing about works of art. He felt it to be a duty as far as his limited means allowed to give substantial support to artists. In his capacious mind there was no separation between art and the artist, and as he admired the former he was convinced that the producer had a claim upon him. Accordingly we find that when he was secretary to a secretary in Dublin, he visited an exhibition of pictures and was struck by a historical painting of BARRY'S. At his own expense BURKE brought the artist to London, sought out patrons for him, and, in order to have the young man's talents fully developed, arranged to make him an allowance while he was studying in Italy. In those days there was no man in Great Britain who could be so eloquent over art as EDMUND BURKE, but his practical wisdom convinced him that what was needed was not words, but gold. GEORGE BARRET was another of BURKE'S protégés, and in a financial sense his landscapes were more successful than the heroic figure-pieces by JAMES BARRY. BURKE'S protection was not withdrawn when BARRET became one of the foundation members of the Academy. We need not inquire whether the two painters realised all that was anticipated of them; what we say is that BURKE acted after the manner of his times, and set an example which noblemen and wealthy merchants could imitate. In our time the conditions of patronage are altered, and if BURKE were living now he would show his sympathy with artists in a different but no less efficacious way. MARTIN SHEE had also the advantage of BURKE'S protective power. As a painter he was inferior to BARRET or BARRY, but he could paint a passable portrait, while he was also competent to express his thoughts readily and gracefully in prose or rhyme, or by spoken words. SHEE in consequence became president of the Royal Academy. If he had remained in Dublin there is no doubt he would have been a humble portrait-painter leading a precarious existence.

MULREADY came to London when he was a child, and he was therefore unaffected by the evil influences which await young artists in Ireland. By many experiments he discovered for what kind of work nature had adapted him, and not even MICHEL ANGELO could have been more assiduous in study, which he continued until the end of his life. The night before his death he was working in the life school of the Academy with as much interest as he showed when he was a lad of sixteen. MULREADY'S example is a convincing proof that the Irish nature is not necessarily doomed to be inexact, idle or over ambitious. MACLISE, whose name is usually coupled with MULREADY'S, was, however, much the younger of the two, and unlike the elder artist, he had no uphill climb, for when he came to London he conquered even the critics. He was seventeen when he entered the schools of the Royal Academy; three years afterwards he obtained the gold medal, and in nine years he was an Academician. MACLISE, in spite of his success, always exemplified the difficulties which beset an artist who received a part of his training in Ireland. Until he arrived in London we do not believe he had seen one satisfactory picture. His education consisted solely in the drawing after plaster casts. The result was he became a magnificent draughtsman, but generally failed as a colourist. ELMORE was another Irishman who was indebted for success to London schools. FRANCIS DANBY belonged to the MULREADY period. He realised from his experience in Dublin that unless he abandoned art he must seek a living somewhere else. For a time he resided in Bristol, and there found the success which was denied him in Ireland. But he likewise exhibited at the Royal Academy, and in 1825 he was elected an Associate. Then he came from Bristol to London. Owing to the admiration for his poetic landscapes, DANBY would certainly have been elected an Academician in due course, but after a few years he quarrelled with his fellow artists and left England to live in Switzerland. Among the Irish painters, the artists we have named may be considered the most successful. BARRY'S works were generally too large for private galleries, and with the exception of an occasional portrait ascribed to him, paintings from his brush are unknown in the market. But the other artists produced numerous works in England, and some at least should be obtainable by Mr. HILL. Paintings have to submit, like meaner things, to the law of fashion, and with the exception of MULREADY'S, none of those artists' works are now as much prized as formerly. The

optical investigations by which it was established that MULREADY, like TURNER, suffered from defects of vision in his later years, have of course diminished the value of some of his paintings, but they have sufficient excellence to compensate for the defects which arose from an excess of devotion to art.

Many other Irish artists gained popularity which has not been enduring. It is difficult to escape from the consequences of defective training, and to become inspired by hope through the mere arrival in a strange country. We see a late example of the difficulty of accommodating an artistic nature to new conditions by the comparative failure of the late Sir FREDERICK BURTON. He adopted a new style of drawing, and conscientiously endeavoured to attain the highest standard in his art, but he could not get rid of the depression which is common with strangers, and it was a misgiving that he was in a false position which made him turn his knowledge of art into a new direction. A most competent director of the National Gallery was secured; but, on the other hand, an artist of original genius failed to reveal all his power.

When we take into account the long list of comparative failures which was the fate of so many Irish artists, we are afraid that England will not be able to supply as many works as are desired to the Cork Exhibition. It may be imagined that the dearth of Irish works arises from a dislike among Englishmen. That is not, however, the case. If Irish pictures were seen in London of equal merit with those from Edinburgh or Glasgow, or from Liverpool, Manchester or Birmingham, they would attain all the success they merited. But either from the defects of the teaching or the absence of courage on the part of the artists, Irish works are handicapped in the struggle for success. On that account we suppose there are few Irish pictures in England which were produced within the last half century, but if any can be discovered it would be doing a service if they were placed at the disposal of Mr. HILL for the Cork Exhibition.

ITALIAN DOORWAYS.*

ALTHOUGH we are supposed to be on the high road to communism, when personal distinctions are to be ignored, it is still evident that many men do not care to be confounded with the crowd, and they wish their belongings to have as far as possible some peculiarities by which they can be also distinguished. Hence we see of late years in some of the long streets and terraces of London that doors are here and there painted in the most brilliant yellow or red or blue colour which can be obtained, and form a contrast with those near them. Not long ago a white door was accepted as a singularity, and was supposed to be a sign of refinement, but the colour has become too common, and has therefore lost its interest. The yellows, reds and blues will no doubt share the same fate. The innovation cannot be condemned in all cases. If it is contrary to etiquette to put a red lamp over a physician's door, people who are in search of medical assistance will be glad of another sort of indication, and a messenger who is in a hurry may be contented to learn that in the first house he sees with a large yellow hall-door he will find what he requires. The numbers on houses are rarely legible at a distance, and where fifty houses may be alike in external appearance it is well to have a clue which will serve as a landmark, if it were only glaring colour.

The adoption of a different colour from those usually employed should be considered as expressing more than mere location, or as an aid to identification. It indicates that people are beginning to realise the importance of the doorway, which can be made an expressive feature in a house, and as such deserves more artistic treatment than the English love of plainness and simplicity has bestowed upon it. Just as church doors, especially abroad, were made wide with capacious porches, as if to signify the catholicity of the building in which all the world was welcome to enter, narrow doorways revealed apprehensions on the part of owners and inmates. From its use it becomes the most characteristic part of the house, and is the best remembered. This may be seen, to take one

case, by TENNYSON's reference to the doors of the house in which his friend HALLAM lived:—

Dark house, by which once more I stand
Here in the long unlovely street,
Doors, where my heart was used to beat
So quickly, waiting for a hand,
A hand that can be clasp'd no more—
Behold me, for I cannot sleep,
And like a guilty thing I creep
At earliest morning to the door.

The various aspects under which doors could be regarded are so numerous, it would take long to deal with them in the briefest manner. This is not the place for such an inquiry, nor can we now trace the course of the development of the doorway, although it was not without effect on architecture. It is sufficient to state that when the Renaissance occurred there must have been many doorways in Italy which were more or less allied to Classic examples, and were employed as models. We have a hundred of the Renaissance doorways which were derived from them represented by photographs, geometrical drawings and sketches in a volume published in connection with the *American Architect*. They are divided into ten groups, according to the treatment of the upper part, as square-headed, round-headed, decorative architrave, lintel over lintel, triangle over lintel, arc over lintel, lintel over arc, triangle over arc, arc between lintel, &c. Rome and Florence supply many illustrations, but subjects are taken from Venice, Genoa, Bologna, Milan and other cities.

The ornament on the sides of doorways could also be taken as constituting a variety of methods of treatment. Through the influence no doubt of older examples, or from some principle which we cannot now understand, a great many of the doors can only be described as forming imperfect frames. The lines are carried down from head to foot, and then appear as if about to be carried across from side to side, if the opening for entrance had not disturbed the arrangement. Even BRAMANTE in the doorway in the Cancellaria of Rome has adopted this system, and it is not unreasonable to imagine that a frame for a panel was converted into part of a doorway. An older example is from the Lucca chapter house, and the treatment is sanctioned by its adoption by most able architects. But no authority can make wrong become right, and as a door framing can only have a top and two sides it is absurd to suggest that at one time it had been a quadrilateral.

We need not say that although Italian doorways may be formed into ten or a lesser number of groups they are not repetitions of ten patterns. It can with truth be said that no two of the examples in the series before us are exactly alike. There is always some difference which imparts a special character. The best examples prove that mechanically exact copying was not approved by the Italian architects. The first illustration, for instance, represents a doorway from ALBERTI's fine church of St. Andrew in Mantua. The principal entrance, which is by ANTONIO and PADO MOLA, shows a beautiful design of scroll-work springing from vases near the ground, carried along the architraves and meeting in the middle of the lintel. The main curves are similar, and the leaves, flowers and birds have so much correspondence, they are generally assumed to be identical, but examination shows there is much difference in the details, and the sculptors would probably be unable to repeat their own ornament without introducing alterations. There are several other instances which show a desire for novelty as well as its attainment. The spirit of unity prevailed rather than the mere letter of the law. The general effect is at least equal to any slavish repetition, while the details throughout the composition can be examined from beginning to end with admiration for the invention of the designers.

In the example from the Ducal Palace at Mantua, instead of an attempt to rival the ornament of St. Andrew's, circular reliefs are introduced along the sides, which must have been exquisite works of art in their original condition; unfortunately they are now defaced. The Italian architects were generally able to command the services of sculptors, and thus we find several reliefs which are admirable as compositions and give a crowning glory to the doorways. An example from the Palazzo Doria, Genoa, almost attains the ideal; the building was erected from the designs of MONTORSOLI, who came from Rome for the purpose. But

* *Italian Renaissance Doorways*. Boston: American Architect and Building News Company. London: B. T. Batsford.

owing to the importance which was attached to doorways in Italian cities, artists were allowed to make independent designs for them. In this case PERINO DEL VAGA, who had been one of RAPHAEL's principal assistants in the Loggia of the Vatican, was enabled to have his way. He introduced a pilaster on each side, covered with delightful ornament. Below are trophies of arms on the pedestals, and over the doorway is a frieze of ornament and antique heads. The composition is fittingly surmounted by a panel, on which is engraved "Senat. Cons. ANDRÆ DE ORIA, Patria' Liberatori, Munus Publicum." It is a tribute to an admiral, but suggests that art can have its victories as well as war.

The use of columns to flank doorways is excellently exemplified by illustrations taken from the Palazzo Albergati, Bologna; the Palazzo Vecchio, Florence; the cloister doorway, Santa Croce; S. Pudenziana, Rome (where the shafts have a spiral treatment); and St. Rocco, Venice, where the doorway by means of columns is well united with the whole façade. In the church of S. Alexandra, Lucca, the doorway is surmounted by a very massive semicircular hood supported on consoles; it was intended for the preservation of the beautiful relief by CONSANI of the Blessed VIRGIN with cherubs, and owing to the precaution the sculptor's work continues to be in a perfect state, and still charms by the beauty of the expression. The hood, however, has the appearance of an afterthought, and we prefer the treatment seen in the Certosa of Pavia and other buildings, where the sculpture appears in a recess, as if it were contemplated from the beginning. The entrance to the Arsenal, Venice, although included in the book, seems like a Triton among minnows, with doors of houses, chapels and sacristies. According to the story, the character of the design was determined by the two marble lions brought from Athens, which it was desired to introduce. They, however, look like puppies when compared with the Lion of St. Mark which is above the arch, and which, however necessary as a symbol, puts the remainder of the sculpture out of scale. The figure of a saint which surmounts the pediment becomes inferior to the Venetian lion. But the effect of the sculpture was imposing, and made every spectator feel the greatness of the Government of the city.

Many of the Italian doorways opened into a colossal hall or into a courtyard. They became in consequence more like gateways than ordinary doors. But the general type was supposed to answer in all cases. Among the examples selected there are very few that can be looked upon as barriers for defence. When we see windows transformed into cages we know there was danger of attack, as well as of loss, when any of the young inmates thrust their heads into the public streets to gaze, as SHYLOCK says, "on Christian fools with varnished faces." But there are no signs of any of the ponderous devices which were sometimes necessary to keep out invaders. There is a marked difference between the security presented by the windows and the doorways. Bronze doors may have originated in days when timber would not serve, but in those which were constructed by Renaissance sculptors it was the enduring character of the material to express artistic forms which inspired their adoption.

For the student of architecture it is an advantage to have special series of different parts of buildings like that just issued. Usually the general effect of a building remains most clearly in the memory, and it is well to have records of parts which often are more successful than a building taken as a whole. In some cases the doorways, as we have said, were independent compositions, and although that is not always a recommendation, they can be judged for their special interest as works of art. The selection has been inspired by knowledge and good taste, and the work can become as useful to English architects as to those in America. The plates form suggestive precedents.

Mr. W. Emden has proposed that the Council of each Metropolitan borough, the Common Council of the City of London and the London County Council be invited to appoint one or two of their members and their engineer or surveyor to attend a conference to be held at the Westminster Town Hall, at a date to be hereafter fixed, for the purpose of considering the best materials and means of paving the streets of London.

DURHAM CATHEDRAL.

THE members of the Durham City Field and Research Club last week visited the cathedral church of Durham and its monastic buildings. They were favoured by the guidance of the Rev. Dr. Greenwell, M.A., F.R.S., who, notwithstanding his many disclaimers, is still, says the *Durham County Advertiser*, the very highest authority on all that relates to the magnificent fane that crowns the wooded slopes of the winding Wear.

Dr. Greenwell, who spoke from the lectern, succinctly sketched the establishment of Christianity in Bernicia, the episcopacy of Cuthbert and the settlements at Chester-le-Street and Durham with the latter's body. Canon Greenwell then went on to impart much interesting information respecting the congregation of St. Cuthbert. There was a bishop at the head and a body of monastic people, more or less monks—a celibate clergy who lived in common, presided over by the bishop, who was an integral part of the congregation, but had no separate establishment and no separate estate. The bishopric was removed to Durham in 995, and there could be no doubt as to why the congregation selected the site on which the present cathedral stood. It was naturally a strongly defensive position. It was a flat plateau of land almost surrounded by water and high rocky precipitous banks. Before the introduction of artillery they could not possibly have had a more strongly defended place than Durham. There was only one means of access to it, and that by a steep ascent from the Market Place to the foot of Queen Street. But the latter was fortified by the throwing of a wall across and a moat, &c. Immediately on settling here Aldhun commenced to build his cathedral, which no doubt occupied the site of the present structure. He thought it quite possible if systematic excavations were made upon the site of the nave they would probably find the foundations of Aldhun's church. That had never been done up to the present, hence they were unable to say what was the size of the old church. There could be no doubt it was smaller than the present church. Things went on until the time of the Norman Conquest. Walcher came there when William the Conqueror established his power in England, but did not reign as bishop very long. He was murdered by the people of Gateshead because it was stated his officials had oppressed the people. Not at all unlikely, because, as they all knew, officials were very much in the habit of oppressing people. After Walcher came Bishop William Carileph, who was a Benedictine monk. When he came to Durham, the monastery was still in the hands of the congregation, the bishop having no separate estate. This was repugnant to the notions of Bishop Carileph. But something was still more repugnant to him. The congregation of St. Cuthbert, originally a body of celibates, had become married. There was a great tendency at that time for the Saxon Church to have not only a married clergy, but to become hereditary more or less. At Hexham, where there was a great monastic establishment, the monks not only became married, but became hereditary. Son succeeded father and so on. If that had gone on the whole of the country would have come under the influence of an hereditary clergy. They would have had a body of people separated from the ordinary mass of the public in a very marked way, and in his opinion it would have been an extreme evil. He did not like rule by clergy. They were the worst people to rule anything in the world. They had got their use and their position, and he would not say it was a bad one; but the more they kept the clergy from administering civil affairs and ruling over people, that was irrespective of the religious feelings of the people and religious institutions, the better. When Bishop Carileph came he found the congregation of St. Cuthbert gradually drifting into a married body and an hereditary clergy, and getting the land of the country into their own hands. Bishop Carileph being a Benedictine monk disliked this order of things. Hence in 1083 he dispossessed the whole congregation, established a Benedictine monastery, divided the estates into two portions, and separated the bishop from the monastery. He gave certain lands to the monastery and kept the others in his own possession. And that division had come down to them in the present day, the great revenues being still divided between the Bishop and the Dean and Chapter of Durham. Of course the sums received had been very much cut down by the Ecclesiastical Commissioners, who a good many years ago took the estates of such bodies into their own hands because the bodies referred to were becoming far too rich. Of course the clergy least of all were liable to be spoiled by riches. Most of them had not too much money to be spoiled by. At the same time it was better that bodies like bishops and deans and chapters should have reasonable incomes to live upon, and not the gigantic estates with which they were endowed up to the time of the Commissioners. The latter had made good use of the funds coming into their possession. They had endowed small livings, created new livings and increased the incomes of poor livings. They would excuse this digression. Well, Carileph established a Benedictine monastery at Durham, and to his credit, be it said, he gave the congrega-

tion the option of remaining there as Benedictine monks, or of going away and living with their wives, giving them sufficient to live in comfort. Not one of the monks accepted Carileph's offer. Everyone went away and took his wife with him. He thought those present would agree with him in saying that that was very creditable indeed on the part of the congregation.

In 1093 Carileph returned to his see from exile in Normandy with the intention of building a new church. Aldhun's church was probably too small, or not convenient for the new body of monks, and it was accordingly taken down, and in 1093 Carileph laid the foundations of the new church. The building progressed so rapidly that when in 1099 Bishop Flambard came to the episcopal throne of Durham, Simeon told him he found the church finished up to the nave. "Up to the nave." That must have included the tower. Now they would see that if the tower, a heavy structure, was built, there must have been something to buttress the two great piers to the west. He did that, in Dr. Greenwell's opinion, by building the first two bays of the nave to the west. The details of those two arches corresponded with the details of the arches in the choir, but did not correspond with the details of the remainder of the building towards the west. Dr. Greenwell mentioned other facts in support of this contention. Therefore he concluded that in 1096 the church was completed up to the two first bays of the nave. It seemed a great deal of work to have been done in three years, but he did not see any difficulty in that, supposing they had money and men. Although it seemed a large building up to the nave, he saw no reason why it should not be built in three years. A great many people thought Carileph only built up to the choir, but Dr. Greenwell thought Carileph built up to the first two bays of the nave. The only question was what did the monks do in the interval between the death of Carileph and the coming of Flambard? Did they build the portion in question? There was an agreement between the bishop and monastery that the bishop should build the church and the monks the monastery. Simeon told them that between the death of Carileph and the coming of Flambard that agreement was neglected, and the monks went on building the church. What Dr. Greenwell thought they built was the west side of the transept. It was quite out of character with the architecture of the rest of the church, plainer and therefore likely to be built by people who had not got the same means at their disposal that a bishop had. He attributed the west side of the transept and probably the roof to the monks during the interval referred to. Then Flambard went on, and built the church no doubt on the same lines as were laid down by the architect of his predecessor. It was quite possible that the architect who prepared the original plan still lived on into the time of Flambard, and continued to build upon the lines of his original plan, as he naturally would, until he completed the church to the west end. Architecture was then a living thing, not like the architecture of the present day, which is merely the copying of old things, and really not a living thing at all. Architecture at that time was growing just as one grew from childhood to manhood. Thus that cathedral was built from 1093 to 1128, when it was finished. If the same man had charge he would naturally be affected by the change which was taking place in the growth of architecture. Therefore there was nothing surprising in finding towards the west end of the church details which were in accordance with the development of the great Norman scheme of building then being carried out here. At all events, they were told by the chronicler that Flambard died in 1128, he having finished the church up to the roof.

Now "up to the roof" had occasioned a great deal of difficulty till quite lately. How any person ever conceived such an extraordinary notion he could not imagine, but it was held that the roof of the nave was of about the same date as the roof of the choir, and put on in the middle of the thirteenth century. Well, the architecture itself told them distinctly that it could not possibly have been put on in the middle of the thirteenth century. One was as different from the other as could possibly be. It possessed all the characteristics of the early part of the twelfth century. The only difficulty which had caused people to take the extraordinary view referred to was that there was a pointed arch. Pointed arches came into use some years before that roof was put on. Therefore he had no doubt, taking into consideration what the chronicler told them, Flambard finished the church up to the roof, and that the monks in the interval between the time of Flambard's death and the coming of Galfrid Rufus finished the nave. Therefore there was nothing left except the roof to put on. Hence they might put the roof at 1130. Now they had got the whole church completed.

The Galilee or lady chapel was built by Bishop Pudsey. The latter commenced to build at the east end, but did not carry out his work there. He (Dr. Greenwell) did not know why. St. Cuthbert was said to have shaken it down. That was one of the stories told, and those present could believe it or not. St. Cuthbert was said to have had a more

than ordinary dislike of women. He believed there was not a word of truth in it, because some of St. Cuthbert's greatest friends were abbesses, therefore to say he had an aversion to ordinary women seemed absurd. However, the story was that Cuthbert would not allow Pudsey to build a lady chapel near to where his bones rested, and told him to build at the west end, which Pudsey did. And there they had the magnificent and exquisite Galilee chapel, one of the finest monuments to the architecture of that period to be found anywhere. Thus they had the great church of Durham, the grandest building in the world. He did not think there was any building superior to it. Of course, he might be thought to be prejudiced, but having seen all the great buildings in Italy, France, Germany, he had not seen a building which impressed him nearly so much by its solemnity and grandeur as the church of Durham. He did not care where they went, they would not see a church which surpassed Durham.

Returning to the east end, what they saw at present was not the original termination of the cathedral. The original termination was in a semicircular or apsidal form, the foundations of which would be pointed out to them. Soon after it was built the roof, particularly at the east end, gave way. That up to a certain time was held to have been caused by the foundations not being good. That idea had now been proved to be entirely fallacious. He had himself held the same view, which only showed how foolish it was to speculate when there was an opportunity of testing. The original foundations at the east end went down to the solid rock, 14 feet thick, good enough to stand till the crack of doom, which very likely they would do. What he believed to be the cause of the shrinkage was this. A roof was put on to the Norman choir in 1104. Architects were supposed to know everything about architecture. But his opinion was that architects knew no more about architecture than doctors knew about doctoring and lawyers about law. He had heard architects say no man ever put a roof on a building so large as that as early as 1104. That was a stone roof. They said a wooden roof. He was talking to a very eminent architect the other day, and he urged that view. Well, replied Dr. Greenwell, it was perfectly true there was no other church he knew of in existence where there was a stone roof put over such a width as at Durham, and which he claimed was done in 1104; but how many churches have been utterly and totally destroyed? There might have been such roofs put on as early as 1104, but no longer existing. But putting that aside, why should not Durham be the first church, though it be so large, to have a stone roof? That was unanswerable. His friend admitted that Carileph's architect was a very great man, one of the greatest architects that ever lived. Then, why should not one of the greatest architects that ever lived have been so far before or up to his time as to put on a stone roof? His friend could not answer him, and Dr. Greenwell chimed in with "He did it." He believed the cause of the shrinkage was this. The great man referred to had the courage to do something which no one had ever done before, and that was to put a stone roof over so wide a space, but he had not equally as much skill as he had courage. He put the roof on, it stood for a certain time, and then began to give way. He had not calculated on the forces likely to act against it. In 1242 they took down the east end, and replaced it with the beautiful chapel of the Nine Altars, one of the very finest specimens of thirteenth-century architecture that existed anywhere. If those living in Durham wished to make themselves acquainted with the architecture of the thirteenth century they could not have a better text than the chapel of the Nine Altars at Durham.

The party was then conducted over the cathedral by Mr. Freeman, head verger, who in many instances furnished details to what Dr. Greenwell had already said. Proceeding to the shrine of St. Cuthbert, Mr. Freeman pointed out the foundations of the original apsidal termination of the cathedral, remarking that the work was now as good as it ever was. Many interesting particulars were given respecting the shrine of the patron saint of Durham, and what was discovered in the grave when recently opened. Much interest was evinced in a rich altar frontal over 200 years old, and brought here by Canon Body. After hearing much of value respecting the beautiful chapel of the Nine Altars, Mr. Freeman conducted the party to the choir. Bishop Beaumont's monumental brass, 18 feet long, and the bishop's throne came in for special attention. The restored chapter-house was next visited, and the graves of Flambard, Rufus and William de St. Barbara pointed out. By way of the cloisters, built by Bishop Skirlaw, the Galilee chapel was reached; the remains of the ancient frescoes on the east wall, the tomb of the Venerable Bede, and the old well-house at the west end seemed to attract most attention.

The party was next conducted to the chapter library, where Dr. Greenwell again took charge. He said the room in which they were now assembled was the dormitory, or sleeping place, of the monastery. The other part of the library was the refectory. Originally a partition ran down the centre of each

window, and another partition midway between each window, making a small cell where the monk had his bed. That was the only place he had in the monastery. All the monks slept in the monastery, and they all dined together. The whole of their time, except when sleeping in their little cubicles, was spent together. There were something like seventy monks in the monastery besides novices and certain lay people more or less connected with the domestic arrangements. All slept in that room. There was an open space up the centre, along which one of the older monks walked during the night to rouse the monks to attend the several offices of the Church fixed for the early hours of the day, and also, no doubt, to keep order and prevent them playing pranks. After the Dissolution the Dean and Chapter converted that room into a prebendal house, and he remembered it as such, and occupied by Dr. Wellesley. Dr. Greenwell having given particulars as to how the dormitory was then arranged into rooms, went on to say that when the number of prebends was reduced from twelve to six there was no longer occasion for so many prebendal houses, hence the partitions and temporary floors were removed and the room added to the chapter library. In every respect, with the exception of the new windows and the removal of the partitions of the little cells which the monks occupied, the room was exactly in its original condition. The fine old roof which they saw was finished in 1404. The timber, roughly squared oak trees, was cut in the woods of Bearpark, which belonged to the prior and convent of Durham. The latter had extensive woods in various parts, but the wood which produced the best timber was Bearpark. They would scarcely believe that when that room was cleared out and made into a library, the chapter of that day wished to take off that roof, which they said was so mean and contemptible, and put on a high-pitched roof made of pine. Fortunately, they employed an architect, a man of large private means; consequently, not like most architects nowadays, who generally cared most about their percentages, and he refused to do it. Through that architect's refusal that roof was saved. They would all agree that there could not be a finer roof, which had lasted now for 600 years, and would last for as many years more. It was perfectly sound. He did not think there was a single plank in that roof bearing the slightest signs of decay. Dr. Greenwell then proceeded to describe the sculptured and inscribed stones in the library, mostly headstones and grave covers. The remains of three memorial crosses (of about the year 800) from St. Oswald's, Durham, proved that there must have been a settlement on the opposite side of the river before Aldhun came in 995. The Acca and Ruthwell crosses, heads of crosses found in the chapter-house, grave covers, &c., were all described in detail. Dr. Greenwell said these stones had come from various places, and had been got together by himself. When he first became connected with the library there was not a single piece of stone of that kind in the place. He had got them together by buying, some had been given, and others, he was sorry to say, had been stolen. He would tell them the circumstances under which he was induced to steal. He was driving with two friends through the North Riding of Yorkshire to see some churches. They went into a certain churchyard and saw a very pretty grave cover for a child all covered with beautiful ornamentation. His two friends urged him to take it back to Durham with him. No, he said, he had never stolen yet, and hoped to keep honest as long as he lived. Well, he went and saw the parson, and acted very foolishly. He praised this stone. He should have spoken of it otherwise. He found, however, the parson would not treat, but promised to put the stone inside the church. Three years afterwards his friends and himself were again driving through the same district and went to see this stone. It was neither inside the church nor in the graveyard, and on inquiring they found the sexton's wife had powdered it into sand. He declared that the next stone like it he saw he would carry off. He had since carried off three, but would not tell which they were. Dr. Greenwell next referred to St. Cuthbert's coffin, his patient labours in piecing together the fragments found in the tomb, what the carved figures symbolised, and so on. We are sorry that lack of space forbids more than this bare mention. The same applies to the relics in the adjoining portion of the library—fine embroidered work, a cross and a portable altar, believed to have been personal relics of St. Cuthbert, a stole, a maniple, the rings of Flambard, Rufus and William St. Barbara, Flambard's pastoral staff, and illuminated manuscripts of the twelfth and fourteenth centuries, and which the members spent some considerable time in examining.

At the close Mr. Brock proposed a hearty vote of thanks to Dr. Greenwell, which was carried by acclamation.

In his reply Dr. Greenwell promised the members an address on Ancient Britons, showing the progress made from the implements they used until the present state of civilisation was attained. He thought he could show them things that belonged to a time 2,000 or 3,000 years ago, and which they would admit were as well and as beautifully made as anything could be at the present time.

LIVERPOOL CATHEDRAL.

THE influential and representative body of Churchmen charged with the erection of Liverpool Cathedral are now, writes a special correspondent of the *Liverpool Courier*, approaching important matters, upon which they will do well to consult public opinion before they come to irrevocable decisions. Unlike their predecessors, who fixed upon a site and obtained designs, but failed to raise subscriptions, they, probably having learned much from that sad experience, first of all induced a liberal flow of donations, and then with wonderful unanimity and commendable promptitude chose a site to which no serious objections have been urged. That site, St. James's Mount, belongs to the Corporation of Liverpool. The application of the committee to buy enough land for the cathedral is now under the consideration of the finance committee and of the parks committee, and while no bargain has been struck, there is no reason to think that the City Council will refuse to sell on reasonable terms for the erection of a building which will be one of the most attractive features within its administrative area.

The next questions which the committee have to consider are connected with the building itself, what shall be its style, who shall be its architect? For that purpose a building sub-committee has been appointed. Much of its success may depend upon a wise selection of its chairman, and on looking at its composition one name naturally suggests itself for that position. Mr. Robert Gladstone has been the foremost, if not the first, advocate for the selection of the St. James's Mount site. He is a gentleman of much administrative and business capacity—his chairmanship of the Mersey Dock Board testifies to that fact—and if he were to accept the position the public would rest satisfied that he would devote himself wholeheartedly to a successful issue.

When the sub-committee has chosen its chairman let it walk warily. There has been much advice already given. An attempt has been made to persuade the committee and the public that the former are in honour, though not probably in law, bound to take up the design prepared by Mr. W. Emerson, of Westminster, which Mr. Ewan Christian reported upon in 1886 as being the best of the three then submitted, or to give the work of preparing a new design to that gentleman. The mention of a few facts will be sufficient to show how untenable is this contention. The site—St. John's Churchyard—was admittedly a circumscribed area, with very different levels, and dominated by St. George's Hall and other buildings in the Classic style. Competing architects were told to have regard to the proximity of such buildings, and Mr. Christian, in his report on their designs, again and again refers to this proximity as affecting details. Orientation was observed; important parts of each design depended upon the differing levels. The new site is altogether different. It would be unwise, ridiculous, stupid, to take a sixteen-year-old design and try to fit it to the new locality. For St. John's Churchyard site Mr. Christian thought it would have to be "carefully and judiciously revised." The "revision" the new site might render necessary, not only in adaptation of details, but in change of general appearance, would practically amount to a new design.

Then as to the committee being bound in honour to employ Mr. Emerson as the architect, he received 300 guineas for his design, and no promise was made that it should be accepted or he engaged, and each of the two other competitors—Mr. Brooks and Messrs. Bodley & Garner—is in exactly the same position as to payment and absence of promise. Indeed, the advertisement for competitors declared "the committee to be absolutely free to accept or reject any or all of such designs after such payment." The death of the scheme for a cathedral on St. John's Churchyard site, with the discharge of all financial undertakings by the old committee, gave any future cathedral committee an absolutely free hand.

The sub-committee therefore need not trouble themselves about the old designs. Fifteen years have elapsed since they were submitted, and many things have happened in that time which should help them to a proper conclusion. The Liverpool Architectural Society have made a series of suggestions to the cathedral committee which may be reproduced.

Choice of Architect, by Competition or Otherwise.

1. A limited competition is not advisable, as such competitions are only suitable when there is a recognised number of men possessing special expert knowledge. Very few architects in England can be said to have the necessary qualifications in this instance. 2. Two courses, in our opinion, are open to the committee:—(a) They can appoint their architect without competition, if they choose asking certain architects beforehand to submit drawings of executed work. (b) They can institute an unlimited competition, open to all English architects. 3. This is the course we particularly recommend, and in the event of its being adopted we make the following suggestions:—(a) That two competitions be held, one preliminary the other final. (b) The drawings in both to be sent in without name or motto, and numbered as they arrive. (c) The

drawings of the first competition to be to a scale of 1-16th of an inch to the foot. No perspectives to be submitted; the drawings to be in black and white; no colour allowed; no internal fittings to be shown; and only such drawings required as are absolutely necessary to explain the design. (d) That from the first competition not less than six nor more than ten be selected for the final. (e) That the authors of these designs be paid each the sum of, say, 300*l.*, on submitting final designs. (f) That assessors (not less than three), representing different schools of architecture, be appointed to draw up the instructions before they are sent out to architects, to select the designs for the final competition, and to advise the committee on the final decision. (g) That six months at least be allowed for the preliminary competition, and twelve months for the final. (h) That the question of style be left open. (i) That the successful competitor be employed to carry out the work.

Style to be Adopted.

We submit for your consideration:—1. That a modern cathedral should be representative of the art of the day, and not a copy of a bygone style. 2. That the word "style" is generally wrongly applied. It is not chiefly the detail that makes a style, but the method of construction employed. 3. That buildings may be carried on many and small points of support, as in the Greek and Gothic; or on few and large points of support, like the Byzantine and Renaissance. 4. That either of the latter permits of open unencumbered floor space, so necessary in a new cathedral. 5. That those who hold that Gothic is the only style suitable for churches forget that the Byzantine is the first of the great Christian styles, that Romanesque comes before Gothic, and that the largest church in Christendom and the cathedral of London are Renaissance. 6. For these reasons we recommend that, as before mentioned, no instructions be issued to competitors regarding the style to be adopted.

The Site.

That the disposition of the building on the site be left open to the competitors, they being informed that the St. James's Cemetery can be encroached upon if considered necessary.

The recommendations as to the choice of architect differ from the procedure on the former occasion. Then professional architects, and even amateurs who had given special attention to ecclesiastical structures, were invited to submit working drawings, not of a cathedral, but of buildings for whose architecture they had been responsible. Each competitor was limited to submitting a portfolio containing three complete sets of such drawings. No fewer than 101 portfolios were sent in. The heavy task of going through these fell to Mr. Ewan Christian, who selected forty-one for the committee's inspection, and subsequently twelve of these were picked out as the best. Mr. Christian regretted his inability to put any Liverpool architect in that list. Ultimately four were asked to submit designs for a cathedral. Three of these have already been named. The fourth, Mr. J. L. Pearson, R.A., was too busy with other work to accept the invitation. Each of the three who did compete was paid for the design submitted, after Mr. Christian had again reported. There is a feeling that in the unlimited competition proposed by the Liverpool Architectural Society, for which not past work but a specially prepared design is to be asked, architects of eminence, busy with other and paying work, would decline to take part; that such a contingency which has already been hinted at as probable would be prejudicial to the success of the competition, and that the better course may be to select a limited number of experienced architects who have proved their powers, and ask them to compete, offering each 300 or 500 guineas for their designs, whether approved or rejected. It rests with the committee to say what should be done; they need not rush at a decision but should weigh well what is to be said on both sides.

As to style the ultimate decision, no doubt, must rest with the committee. It may be that both English church tradition and natural situation of site will determine most architects to adopt the Gothic rather than the Classic, and it may also be that the individual members of the committee incline to that style. With the unlimited competition advocated by the Liverpool Architectural Society, there could be no harm in allowing each architect unfettered discretion as to style, but if the competition be narrowed then something may be said in favour of a certain indication of the committee's preference. But this is another subject upon which there should be careful deliberation.

As to the final suggestion of the Liverpool Architectural Society, there will be a general feeling that it would be unwise to encroach upon the cemetery if by that is meant a building across the valley, for such an encroachment is unnecessary, and would provoke much public feeling. The report recently made by Mr. Bradbury shows that a magnificent building can be erected on the solid rock in the northern portion of St. James's Mount, and that fact should be a determining point in the instructions to competing architects. It may also have its consolations to those zealous and jealous guardians of our

open spaces, for it means that the greater part of the gardens would remain at the unrestricted service of the public.

In the *Courier* of Tuesday the following leading article appears:—The Liverpool Cathedral building committee has entered upon its task without undue delay. Such an undertaking will not stand being rushed, and, on the other hand, evidence of continued progress is essential to success. The committee would seem to have hit upon the happy mean. Two important steps were taken yesterday. In the first place, Mr. Robert Gladstone was elected chairman. As a special correspondent of the *Courier* suggested, no man is better fitted, alike by business capacity, sound taste, local patriotism and devotion to the cause, for this extremely important position. Everybody felt that much would depend upon the chairman of the building sub-committee, and there will be practical unanimity of assent to the statement that the best possible selection has been made. Next the committee tackled the difficult question of the style of the proposed edifice. Many people feared that this might prove a hurdle in the path, as difficult to negotiate as the matter of the site itself. The recommendations of the Liverpool Architectural Association alone suffice to show how varied opinion on such a subject may be, and if the decision of the committee had been delayed it is virtually certain that contentious recommendations would have poured in upon it to an embarrassing, not to say bewildering, extent. Some may think that a point so vital should not have been disposed of out of hand, but our conviction is that in the circumstances the action of the committee was wise and prudent. As we understand, the adoption of the Gothic style does not amount to a declaration that Byzantine, or the Renaissance, or any other style is objectionable in itself, or as being non-ecclesiastical, but simply that Gothic is the style appropriate to the site. No one will dispute that in deciding a question of architectural style regard must be paid to the situation to be occupied by the building. The site may, indeed, be a determining factor, and it can hardly be doubted that it was the dominating consideration yesterday. It will have been observed that the suggestions of the Architectural Association involved a large extension of the building area, and this would practically have meant a reopening of the site controversy, now happily closed. That a cathedral in the Gothic style is best suited to the position as defined on St. James's Mount can hardly be seriously disputed. There is, of course, Gothic and Gothic, and in that sense much remains to be settled, but the appointment of a responsible committee carries with it the delegation of necessary powers, and in our view it would have been impolitic to leave open the broad question.

With the decision arrived at all possibility of utilising any of the designs sent in fifteen or sixteen years ago as a matter of course goes by the board. That must have been so in any case. There is no obligation. The claims of the competing architects for the abortive scheme were clearly defined, and it need hardly be said that designs suited to St. John's Churchyard, with its peculiar levels and special surroundings, are not obviously the best conceivable for St. James's Mount. But, however beautiful, ornate and imposing the best of those designs might be, the verdict in favour of a Gothic structure imperatively requires that the procedure with reference to plans be gone through afresh. Nothing definite is said as to whether or not the committee has resolved to act on the suggestion to have two competitive trials, but the decision to call upon architects to send in portfolios of Gothic buildings they have erected indicates a single and final competition on the part of those whose work is most highly approved of. Our hope is that what has been done will receive the loyal support of all interested in the scheme, not only in the city, but throughout the diocese. The Lord Bishop's earnest desire, as we know, is to see erected in our midst a minster church worthy of the great city of Liverpool and of the high purpose to which it is to be consecrated. We know from bitter experience that to satisfy every individual taste is impossible. One man's leaning is towards Byzantine or Romanesque; another holds that Gothic alone is truly ecclesiastical. If the committee were to attempt anything of the nature of a plébiscite, hopeless strife and confusion would be the result. We should have battling enough and advice in nauseating copiousness, but no cathedral of any sort or kind. The person who gives counsel on such a subject is profoundly convinced of the duty of other people to sink their personal opinions and prejudices. He alone ought to be allowed to dictate, and the name of this individual is Legion. To us it seems that the proper attitude is to believe that a beautiful and worthy cathedral in almost any style may be erected, and to repose faith in the taste and judgment of the men to whom has been confided the onerous duty of acting for the subscribers in the matter. With the Lord Bishop are associated the Earl of Derby, the Hon. Arthur Stanley, Sir W. B. Forwood, Mr. Robert Gladstone, Mr. Douglas Horsfall and many other "men of light and leading," known and tried by the community in many departments of activity.

NOTES AND COMMENTS.

THE expenditure on the excavations at Silchester during the year 1900 amounted to 550*l.* 3*s.* 7*d.* It is proposed during this year if possible to begin the systematic exploration of a grass field in the centre of the town, which may be as productive as any of the insulae. Taken as a whole, the results of the season's work were fully up to the average, both in the character of the buildings uncovered and the variety and number of objects found in and about them. The quantity of pottery and the hoard of smiths' tools are also quite exceptional. The objects in bronze, bone, &c., include many which are interesting. The coins found were as numerous as usual, but not very important. A house of large size with several mosaic pavements was uncovered on the east side of insula xxiii., and in the mouth of its courtyard was a small square building which may have been devoted to sacred purposes. This had been built up round a small and earlier structure of the same character. The other traces of buildings in this insula, despite its size, were singularly scanty, but the rubbish pits and wells were unusually productive in objects of interest. In pottery these yielded upwards of a hundred whole vessels of all kinds and sizes, and from one of the wells was recovered another great hoard of iron tools, mostly a smith's. Another house in insula xxiv. was of unusual interest from the peculiarity of its plans and the number of mosaic floors. Traces of several structures were found in insula xxvi., one of which was represented by a solid circular platform with a cement floor 27 feet in diameter, enclosed apparently by woodwork or half-timbering.

ILLUSTRATIONS.

ABBESS GRANGE, HANTS.

THIS house has been erected by practically pulling down the old house which formerly occupied part of the site, and by rebuilding it according to the accompanying plans. It is most picturesquely situated on a plateau between two steep escarpments, and is surrounded by excellent scenery. The ground floor consists of a large staircase, hall and inner hall, drawing-room, dining-room, library and offices. A billiard-room, crowned by a copper-covered dome, forms the eastern wing, and serves as a screen

to the kitchen approach. The exterior is in a quiet mullioned type of design. The whole of the ground floor has been panelled in oak to a height of about 9 feet, and also in oak are the mantelpieces of the principal rooms. Modelled plaster has been used for the ceilings and oak parquet borders for the hall and borders of the principal rooms. The general contractors for the whole of the work were Messrs. GOUGH & Co., of Hendon.

The panelling and fireplaces were by Mr. J. P. WHITE, of Bedford, the main staircase of oak by Messrs. ELLIOT, of Newbury, the leaded lights by KELLY & Co., the door and window furniture by Messrs. ELSLEY. The hot-water system and electric-light work, drainage and water supply by Messrs. RAWLINGS. The drainage has been carried out on the most approved principles of collection and disposal. The electric-light plant has been installed, and it is worked by a 10 horse-power oil-engine, the latter being also used for pumping the well water to a reservoir on the hill above the house. The works have cost about 17,000*l.* The whole of the works have been carried out according to the designs and detail drawings and under the superintendence of the architects, Messrs. BANISTER FLETCHER & SONS.

CATHEDRAL SERIES.—CHICHESTER: TOWER AND SOUTH TRANSEPT.

TUNKESBURY ABBEY: SOUTH AISLE, LOOKING WEST.

THE NEW CATHEDRAL, WESTMINSTER.

PROPOSED HOUSES AT HAMPSTEAD: LYSS, HANTS; AND WALTON-ON-HILL, SURREY.

THESE houses are intended to be mainly covered externally with white cement rough-cast, any portion not so covered to be faced with red brick. The whole of the roof to be covered with Broseley tiling. Any half-timberwork to be left black, as a strong contrast to the white rough-cast walls. All windows will be fitted with cast-iron casements and filled with glazing in leaded lights.

Internally in each house the hall and staircase has been made a special feature, being so arranged that the hall can be used as a lounge or smoke-room, with the staircase opening out of it, and a gallery running round the upper portion of hall and the principal bedrooms opening from same.

The two Surrey houses and also the Lyss house are intended for very picturesque and beautifully wooded sites of several acres each. Mr. J. W. COBB is the architect.

UNITARIAN CHURCH, BESSBOROUGH ROAD, BIRKENHEAD: GROUND FLOOR PLAN.

(J. Joseph Talbot, Architect, Liverpool and Bolton.)

The above plan was referred to in the description of the building which was printed in last week's *Architect*.

EDUCATIONAL BUILDINGS, WESTON-SUPER-MARE.

THE new museum in the Boulevard, Weston-super-Mare, is of red brick with Bath stone dressings and facings. The interior is divided between the free library section and the museum department. The latter is splendidly equipped, and though somewhat small there is ample ground space in the vicinity for considerable development. As regards accessibility and light it is as perfect as could be wished, and the hon. curator (Mr. W. H. Palmer) has been able to arrange the con-

house and museum were added in 1868. In addition to collections from South Kensington, others have been added since the opening ceremony. Mr. G. E. Weare both directly, and as the channel of other donors, has made many gifts, and though all are interesting, some of them call for especial mention. There is a curious stone, showing the distinct profile of a man's face, that was picked up at Anchor Head. Also some fossil wood excavated at Albert Road, Weston-super-Mare, 10 feet below the surface. Another local relic is a lock from Brean Church, left in the hands of Mr. Weare by the late Mr.

MUSEUM AND LIBRARY.

tents in a satisfactory way. The nucleus of the collection was some natural history objects and curios well known for so many years past as that of the Albert Memorial Museum. This was commenced in a very humble way about forty years ago by Mr. Mable, and was the result of classes held by him for boys and lads in connection with a night school which was established in the Emmanuel parish of Weston-super-Mare. This collection and his class work rapidly increased, and it was soon found desirable to erect buildings for a night school in 1863. A superintendent's

John Palmer for presentation to the public museum. Mr Weare also contributes some trade cards of some of the first established tradesmen in Weston-super-Mare, together with one relating to the general shop at Worle, from which the supplies for the inhabitants of Weston were formerly obtained. There are newspaper cuttings from *Farley's Bristol Journal* and other information relating to the stage coaches, mails and the "twopenny post" established between Bristol and Weston-super-Mare, and there is an amusing caricature of the return of four Weston fishermen after an unsuccessful sail in quest of

sprats by the late Sir A. H. Elton. There is a small collection of the organic remains of pleistocene mammalia (cave bears, hyænas, bison, wild horse, &c.) found in the caves at Uphill in 1898, including breccia with bones and teeth protruding, together with some nodules of flint, wrought-flint implements and a few rounded stones (quartzites) found in excavations on

&c., of a reindeer which were excavated from a gravel quarry on the road to Bleadon are interesting. A transcript copy, from the original publication, of the meeting on the sands at Weston-super-Mare of Miss Hannah More and Dr. John Langbourne, one of the English minor poets, in the year 1773, with the lines written by them on the sands, and afterwards

SCHOOL OF SCIENCE AND ART.

the hill adjoining the caves, which latter are believed to have been used, after being heated, for boiling water. The heated stones were immersed in water placed either in the skins of

THE OLDEST WORKED STONE IN WESTON-SUPER-MARE.

animals or in holes made in the ground and lined with clay. Stones of this kind were undoubtedly used by our prehistoric ancestors for heating water. Portions of the bones, antlers

transcribed, has been lent, together with the lines added by the Rev. D. Powell, the clergyman of Weston-super-Mare.

The architect of the building is Mr. Hans F. Price. The carving was executed by Mr. J. P. Steele. Mr. H. W. Pollard was the general contractor.

The School of Science and Art has also been designed by Mr. Hans Price. Both are important additions to Weston-super-Mare, and will increase the interest of the town as a residential resort which will have educational advantages.

The New Technical School, New Brighton, was opened on Saturday last. It is a commodious structure erected at a cost of 5,400*l.* upon a site presented to the district by Alderman James Smith, and was designed by Mr. W. H. Travers, district surveyor. It is substantially built, the elevations being of Ruabon brick with Stourton stone dressings. The style is what may be described as English Domestic, and advantage has been taken of the peculiar shape of the site and its prominence at the corner of Field Road and Rawson Street to introduce what is a striking external feature, in the shape of an octagonal tower containing a teachers' room on each floor. The building is two storeys in height, the main entrance being in Field Road. The ground floor comprises vestibule, inner hall, classroom, to be used temporarily as a reading-room, cooking and laundry classroom, with pantry and stores, workshop, cloakroom and lavatory, while the second floor includes two classrooms and a science lecture-room. The building is fitted with hot and cold water, and special attention has been paid to the heating and ventilation.

TEMPLE BRUER.—II.

OUR account of the Temple Bruer in history broke off last week at the finish of the general description of the architectural features of the ancient church. It will be recollected that we were told "beneath the church and tower was a perfect labyrinth of vaults and dungeons and intricate passages, arched over with stone, branches of which run under the floors of the church and tower and below the pavement of the cloisters." It will doubtless be interesting to our readers to learn a little more about these vaults and the traditions attached to them. A footnote in the late Rev. G. Oliver's book is as follows:—Some of these vaults were appropriated to purposes that it is revolting to allude to. In one of them a niche or cell was discovered which had been carefully walled up, and within it the skeleton of a man, who appears to have died in a sitting posture, for his head and arms were found hanging between the legs, and the back bowed forward. Immuring was not an uncommon punishment in these places. An instance of it was discovered a century back (1737) in one of the walls of Thornton Abbey, in this county, and Sir Walter Scott has drawn a thrilling picture of such an occurrence in his beautiful poem of "Marmion," canto xi. Another skeleton of an aged man was found in these dungeons, with only one tooth in his head. His body seems to have been thrown down without order or decency, for he lay doubled up, and in the fore part of his skull were two holes, which had evidently been produced by violence. In a corner of one of these vaults many plain indications of burning exist. The wall stones have assumed the colour of brick, and great quantities of cinders mixed with human skulls and bones, all of which have been submitted to the operation of fire, and some of them perfectly calcined. This horrible cavern had also been closed up with masonry.

Underneath the cloisters, between the church and the tower, many human bones were discovered, which appear to have been thrown together in the utmost confusion, and lying in different strata, some deep and others very near the surface. Near these interments was a vast mass of burnt matter of various descriptions, and the fire had been so fierce that the external surface of a massive cylindrical column, which was discovered near, is completely cinerated. Several large square stones were taken up, with iron rings attached, and altogether the ruins exhibit woful symptoms of crime and unfair dealing. We can scarcely forbear entertaining the opinion that these are the crumbling remains of unhappy persons who had been confined in the dungeon of the preceptory, for the Templars and their successors were always in feud with their neighbours, and would not be very likely to remit what they might conceive to be the merited punishment of delinquency.

When the remains of the Temple were visited in the seventeenth century by that indefatigable antiquary, Gervase Hollis, it contained several armorial windows. He describes the shields of the noble families of Deincourt, Cromwell, Tateshall, Ufferd, Beke, Willoughby, Mowbray, Beaumont, Bardoff, Cantelupe, La Warre, Wells, Zouch, Grey, Savile and others to which no names are attached, and he was only just in time to place them on record before Oliver Cromwell planted his cannon on the neighbouring hills to the west, battered down a great part of the church and pierced the tower with his balls, leaving an aperture as a memento of his presence, to which tradition still attaches his name.

It appears that when this was done the soldiers rushed forward to complete the scene of devastation by destroying every vestige of ornament which might remain. They dug a hole within the consecrated walls in the north, and lighting a fire with the beams and rafters which had been dislodged from the roof, they tore out the windows, and amidst shouts of savage triumph, as may be supposed, threw them into the fire, gloating over the work until all were melted into a solid mass. Then filling in the hole with stones and rubbish they left it in that state to perish in everlasting oblivion. But their expectations have not been realised, for October 31, 1832, the mass of melted lead, with lumps of vitrified glass mixed with calcined stones, charred wood and ashes, was discovered and taken out.

About half a yard below the site of this horrid feat we found an interment. The skeleton was perfect and lay, as usual, with its feet pointing towards the east. The skull small and the teeth delicate induce the belief that it was a female; and if so it was probably the remains of Dorothy, the wife of Roger Roletton, who died in the month of January 1529, and was buried in the north aisle of this church under a tomb with arms quarterly and an impalement as follows:—"1 and 4. Party per fess gu. and ar. a lion passant in chief of the second; in base a cinquefoil pierced az. 2 and 3. A chevron between ten martlets sa. Impaling, ar. ten torteauxes, a label of 3 points az. Roletton and Babington." If the above conjecture be correct the atrocity of the conflagration is greatly increased from the circumstance of its having been kindled in the grave of this lady, which the fanatics had probably broken open in search of treasure.

From a minute inspection of the remains I should not be

inclined to praise the magnificence of the edifice as a whole, though it had its peculiar enrichments, as may be evidenced by the numerous carved stones which have been excavated. The outer wall of the church was rude though massive. It is, however, venerable for its high antiquity, and in extent the Temple was stupendous, for these proud ecclesiastical warriors required considerable room for the number of domestics which were found necessary to support their state and dignity. In the course of investigations made amongst the ruins during the years 1832 and 1833 were discovered foundations of buildings in every part of the area enclosed within a space of a quarter of a mile square. In addition to the usual monastic functionaries or obedientiarii, the house at Temple Bruer was regulated by the state officers which distinguished a baronial castle. A numerous train of retainers was entertained, who were always ready to execute the will of the superior, and his fortified house was provided with every requisite to repel an assailant. The numbers may be further evidenced by the consumption of malt liquor, which must have been enormous, as they had breweries in constant operation at Blankney, Metheringham, Scopwick, Kirkby, Billingham and Timberland, and the vaults underneath their premises are sufficient to show that they lacked not conveniences for its disposal. It did not often happen that an attack was made on these military recluses, for being brought up to the use of arms, and their courage and tact having been often proved in the field of battle, they established for themselves a formidable character, and their vindictive spirit and haughty demeanour were an earnest of a dreadful retaliation to their enemies.

The staircase in the tower was partly intended as a means of access to the upper storeys, and partly for mounting to the battlements. This was the warder's station, and accordingly we find it furnished with loopholes at every gradation of the ascent, all of course pointing towards the only avenue by which the Temple was accessible from Hermen Street, then the direct road from the Metropolis, and almost the only one which connected these parts with every district in England. This avenue, winding its way through a beautiful valley, terminated at the entrance of the Temple, which was carefully fortified with gate and portcullis. The place is still marked by two high mounds, called the Bar Gates, that contain the remains of the two embattled towers by which the entrance gate was flanked and protected under the provisions of a license of 34 Edw. I.

The reflections which arise in the mind on a view of this portion of the precinct, from the most elevated part of the warder's tower, are highly gratifying. The spectator might almost fancy he beheld the

Christian host in its prided power

returning from the Holy Land to change their sword and helmet for the monk's cowl, and the steel and corslet for the simple white robe decorated with the symbol of their order. He might in imagination hear the clank of armour respond to shrill clarions' sound while spears are glancing and pennons waving, emblazoned with many a noble device in which the bright Red Cross shone with distinguished lustre,

And their plumes to the glad wind float,

as the warriors issued through the portal in stern and solemn array, met by their brethren of the Temple in procession, bareheaded, the emblem of their salvation elevated in the air, to conduct the warriors to the holy altar, that

The mass might be sung, and the bells might be rung.

In addition to his conveniences at the Temple, the preceptor had a lodge in Scopwick field, and at a distance of not more than half a mile westward a spacious grange, called St. Thomas's Grange, which was situated about a quarter of a mile eastward of Hermen Street, and almost opposite to the present Green Man inn. It consisted of a large house and offices, a chapel and cemetery, protected by a high mound, and subsequently a stone wall, which enclosed a space of about 10 acres of land. Here this potent chief retired for privacy and seclusion when it suited his convenience, but with an establishment equal to that of any of the neighbouring feudal proprietors, with whom he lived on terms of intimacy and friendship while they continued in his good graces, by paying him the expected tribute of deference and respect as combining in his own person the two high distinctions of a baron and a dignified churchman, and enjoying the privilege of exacting homage at the marriage of a tenant's daughter, which could not be performed without his consent. And it is recorded that, being all men of birth and educated according to the custom of that age, without any tincture of letters, they scorned the ignoble occupation of a monastic life, and passed their time wholly in the fashionable amusements of hunting, gallantry and the pleasures of the table.

The Grange above alluded to, we are informed in a footnote, was ultimately taken down several years ago (1807), and so extensive were the buildings that, as the tenant informs

us, thousands of loads of stone have been removed from the foundations only and applied to the repairs of the adjacent turnpike road; and during the excavations for this purpose the workmen found parts of painted windows, the lead and glass combined as when in actual use, carved stones, human bones and kistvaens or vaults made of stone 7 feet long by 3 feet wide, which could have had no other use than for interment. Near this grange was found some years ago the official seal of Henry, Earl of Derby, who was descended from a younger son of Henry III. He was created Earl of Derby before the decease of his father, at whose death, A.D. 1345, he succeeded to the title of Duke of Lancaster and became High Steward of England. The seal is of brass and of large size. The preceptor had a warren house near the Grange, which had a subterranean vault beneath it, and the place where it stood is at present indicated by a willow tree, which, according to tradition, grew originally out of the prior's oven.

STONEHENGE.

THE recommendations made by the representatives of the Society of Antiquaries, the Wilts Archaeological Society, and the Society for the Protection of Ancient Monuments, whom Sir Edmund Antrobus invited to advise him with regard to the preservation of Stonehenge, are now being carried out. Amongst other things recommended, says the *Wiltshire Mirror*, was an examination of the great trilithon, No. 56 (according to the numbering on Mr. Petrie's plan), which leans at a dangerous angle, with a view of maintaining it in a position of safety. For many years this stone has been in a very perilous position. It is believed that its foundations were weakened by the digging done round the stones in 1620 by the Duke of Buckingham whilst King Charles I. was staying at Wilton. Mr. Petrie, in his book on Stonehenge, says:—"This stone from the evidence of various drawings has inclined further and further since its first tip in 1620. In 1660 it was at 75 degrees, in 1720 at 70 degrees, in 1870 at 66 degrees, and it is rapidly going over further at present. On its fall, which cannot be far distant if unsecured, it will certainly break across, as it is cut unusually thin, has a large flaw in the middle, and will fall across its fallen lintel. To save this stone, the largest native hewn stone in England, and next to Cleopatra's Needle in size, will be far better worth while than attempting to re-erect the fallen trilithon, which undertaking was mooted some years ago."

The stone has now two distinct flaws in it which show more plainly every year. It is proposed to raise it into a perpendicular position, and the work is being carried out in the most careful manner under the supervision of Dr. Gowland, professor of mineralogy at the Royal College of Science, who is acting for the learned societies, and Mr. Detmar Blow, Sir Edmund Antrobus's professional adviser and architect. When raised the stone will be secured in a bed of concrete, which engineering experts believe will support the weight in a position of safety for many years to come. The stone leans towards the north-west, and the excavations for putting in the concrete bed have been commenced on the south-east side. The bottom of the stone was reached at a depth of 8 feet 6 inches. Before the excavations were commenced a careful survey of the surface was made, and when the concrete bed, the top of which will be 18 inches below the ground level, has been completed, the turf will be replaced in exactly the original position. The excavations are being conducted in the most careful and systematic manner. Every particle of earth is being minutely examined, and the system upon which Dr. Gowland is working will enable him to locate everything of interest that may be found. This is the first time since 1620 that any excavations have been made, and now nothing more than is absolutely necessary for the conservation of this unique relic of antiquity will be allowed. The digging done in 1620 by the Duke of Buckingham was of a very promiscuous character, and there is no record in existence of what he discovered. About no other megalithic monument in the world have so many opinions been expressed as Stonehenge. Its erection has been attributed by various writers to the Phœnicians, to the Belgæ, to the Romans, to the Romano-British, to the Saxons and to the Danes. Perhaps its greatest charm is the mystery in which its origin and purpose are shrouded. The solution of the mystery has baffled all our most learned archaeologists, and years ago Mr. Petrie, perhaps the best living authority on the stones, formed the opinion that what was necessary to settle many disputed points was a little careful digging. Acting on the advice of persons so absorbed in past ages, and so conservative in their ideas as representatives of the Society of Antiquaries, the Wiltshire Archaeological Society, and the Society for the Protection of Ancient Monuments, Sir Edmund Antrobus is now allowing such excavations as are deemed necessary for the preservation of the stones to be made, and there is no doubt the nation will watch the progress of the work with great and intelligent interest. So far as the excavations have proceeded some important and interesting discoveries have been made, which will

go a long way towards clearing up at least two points upon which there has been much speculation in the past, namely, the age to which the monument belongs, and how the stones were squared and the mortises and tenons wrought. Dr. Gowland has found a large number of palæolithic implements and some sarsen and syenite chippings, and it is thought that these discoveries clearly point to the fact that the monument dates back to the Stone Age, and that the stones if not wholly were partly dressed on the spot. These are believed to be the first stone implements that have been found in the vicinity of Stonehenge. When research was made in the barrows in the district sarsen stone chippings and bronze tools were found, and from these the opinion was formed by many that the stones were erected by a bronze-using people. If the further excavations which have to be made go to confirm these initial discoveries there will not be much doubt as to the age to which the ancient monument belongs. At present Dr. Gowland is reluctant to express a definite opinion, but antiquarians are agreed that the discoveries which have been so far made are very significant and important. The tools found by Dr. Gowland consist of hammers and axes, and some of them are remarkably well formed. They were discovered about 3 feet from the surface and about 5 feet from the south-east face of the monolith around which the excavations are being made. There is no doubt that further discoveries will be made as the work proceeds, and Sir Edmund Antrobus is to be congratulated on the fact that whilst he is doing all that science and engineering skill can suggest to preserve the stones, he has given antiquarians an opportunity of solving a mystery which has for ages baffled the most learned men.

THE ISLE OF ATHELNEY.

IT was fitting, says a correspondent of the *Daily News*, that Winchester, his capital and his burying-place, should have been chosen as the scene of the celebration of the passing of one of the very greatest in all the long line of English kings, of the death of one of the most heroic characters in history. But the famous place associated with his name lies, not near Winchester, but in the heart of Somerset. Few historic spots are better known to us by name than the Isle of Athelney, and certainly there were few things that had more attraction for us when we first began to listen to the early pages of our rough island story than the tale of Alfred and the Cakes. With the career of the great king, with his indomitable courage, his long struggle against the Danes, his care of the navy, his love of learning and of song, the writings of Pauli, of Freeman and of Green have made us all familiar. But what we remember best is the record of that terrible winter when the fate of England was trembling in the balance, when the king, hard pressed by swarming enemies, fell back for a brief breathing-space to the heart of the Somersetshire marshes. We are too apt to think of him as a solitary fugitive. But although those who were with him in his retreat were few, his army was at no great distance, and the Anglo-Saxon Chronicle expressly says that he was able to make frequent attacks upon the Danes. "It was only later legend," says Green, in speaking of King Alfred's gallant stand, "that changed it into a solitary flight, as it turned the three months of Alfred's stay into three years of hiding. The three months were, in fact, months of active preparation for a new struggle."

The scene of the king's retirement is one of the spots about whose identity there is no dispute. We may stand to-day upon the very ground where Alfred built his fortress—an insignificant rising in the vast green plain that stretches so far across the heart of Somerset hardly to be noticed in the wide expanse of moor. But the ten centuries have changed the face of things altogether. This is not the Athelney that Alfred knew. In his time, as we learn from his friend and biographer, Asser, the island was surrounded by vast peat-bogs, crossed only by paths known to none but to the moor-men, by forests of alder-trees, the haunt of the red deer and the roebuck, while beyond all lay wide sheets of shallow water. The meres have long been drained. The peat is there still, but the bogs are gone. Gone, too, are the red deer and the roebuck. And in the rich meadows that fringe the slow, moving moorland streams whose meeting-place is a mile distant from the island is some of the best grazing-ground in England. The Isle of Athelney of our times consists of rather more than twenty acres of ground divided by a slight hollow into nearly equal parts. On the top of the eastern half stands the monument, a stumpy and inconspicuous obelisk that was set up just a hundred years since to commemorate Alfred's deliverance from his enemies. On the slight slope below it is a farm which occupies, it is believed, the very spot where, ten years after Guthrum's overthrow, the king established a monastery as a mark of gratitude for his victory, and in fulfilment, so the legend says, of a vow that he had made after St. Cuthbert had appeared to him in a vision and assured him of his coming triumph. Athelney, as has been well observed, was endeared to the king by many memories. It had afforded

shelter in his dark hour. It was here that he saw the forlorn vision of St. Cuthbert. Here he divided his one with the beggar. From here he went out alone to reconnoitre the hostile camp, venturing boldly among the armed riors, who gathered round the wandering minstrel.

Unconscious of the coming fight,
When that skilled hand, that swept so light
The harp-strings, would with sterner grasp,
The shaft of vengeful war-axe clasp.

e, too, were spoilt those famous cakes, the smell of whose ring has lasted for a thousand years. There is nothing probable, by the way, in the cake story. And the men of West Country note with pleasure that some high authorities, at any rate, no longer regard it as an idle tale. Of the monastery itself not one stone is left standing on cher. In 1674, when some of the ruins were still to be seen, were being cleared away, the foundations of the abbey arch were discovered, and the workmen found, with other things, a golden spur. A century later a vault was found some yards from the present farmhouse, and parts of what may have been an oratory. Encaustic tiles have frequently been brought up on the spot, and these, together with a few fragments of carved stone, a coin or two, and a leaden water-pipe, lost here perhaps by some pilgrim, are all that remain to judge from the descriptions of those who saw it in prime, must have been one of the most beautiful, though at the same time, as was to be expected from the limited area of the site, far from being one of the largest monasteries in the county. Its history Mr. Hugo collected some very curious details, which, however, present no striking features. One interesting fact is that the abbot, like others of his rank in the county, was fined by Henry VII. for having "aided and comforted" Cornish rebels in their march across Somersetshire. The famous jewel, often said to have been found at Athelney, was dug up in 1693, not here, but at Newton, more than three miles west-north-west of the island, but there can be little doubt that it really is a relic of the monastery. It is of gold, shaped something like the head of a tennis-racket, about 2½ inches long, nearly 1½ inch broad, and not more than ½ inch thick. In front is an oval plate of rock-crystal, half an inch thick, through which is seen the figure of a man holding a fleur-de-lys in each hand. The figure and the space surrounding it are covered with coloured enamel, red, blue and green. Round the edge of the jewel is the legend in Old English characters—AELFRED . MEC . HEHT . GEWERCAN . (Alfred had me made"). The lower part of the gem forms a tube, in which a gold rivet is still visible. This tube, no doubt, once held a slender stem of wood or ivory, and the late Mr. Clifford's suggestion is probably the right one, that the tube was a pointer for a reader or a precentor, and that it was presented to the abbey by King Alfred himself. The site of the battle of Ethandune, in which Alfred broke the power of the Danes, and the position of the fortress where Guthrum still held out for a fortnight after his defeat, are to some extent matters in dispute. It is true that most authorities seem inclined to identify Edington in Wiltshire with the place of battle. But Bishop Clifford considered that there was good evidence that the fight took place not in Wiltshire, but in Somersetshire itself, at another place, on the Polden Hills, seven miles north of Athelney. Three miles to the east of the island, built, like all the moorland villages, on a slight rising in the great plain, so as to be out of the way of the winter floods, is Aller—Oller, as the people call it—in whose little church may still be seen what is believed to be the very font in which were baptized the beaten leader and thirty of his captains. Wedmore, the scene of the "Christm-loosing," and the place where was signed one of the most memorable treaties in our history, is twelve miles north of Athelney. It was at Wedmore, in the summer palace whose massy foundations were brought to light some years since, that the English king entertained his humbled antagonist. That Somersetshire should have been chosen for the site of a royal palace is not surprising. The Mendip Hills, from whose southern verge Wedmore is but four miles as the crow flies, were a favourite hunting-ground of the Saxon kings. In the village town of Axbridge is still preserved a copy of an ancient manuscript which records how King Edmund was nearly killed over the edge of the Cheddar cliffs by a runaway horse while hunting in the Mendip Forest; and the same document mentions that Athelstan, Edred, Edgar and the sainted Edward were accustomed to come down here in the summer to follow the red deer among the hills. The ancient setting of the Isle of Athelney has long since disappeared. No trace of Alfred's fortress or of the abbey that occupied its site is left. But there is no change in the ever-changing hills. The forest, it is true, is gone. But the parish boundaries, the very fields, some even of the old cart tracks, are much as they were in that memorable winter a thousand years since, when the greatest of the Saxon kings sought shelter in the Somersetshire marshes.

DUMMER AND OVERTON.

AN excursion to Dummer, Overton, and the adjacent district, which had not been visited by the Hampshire Field Club for about seven years, was organised for the 12th inst. The party was conducted by Dr. Andrews (vice-president of the club) and Messrs. T. W. Shore and W. Dale (hon. secretaries). There was a field south of Dummer Clump, where Sir R. Rycroft had given consent for a remarkable burial site to be inspected. Large urns containing cremated remains were found in the field in 1888, and on Thursday three more urns were uncovered.

The history of the discovery of the urns was told by Dr. Andrews, who said that twelve or thirteen years ago sheep were being fed with turnips in the field. The shepherd was making holes to put the hurdle sticks in, but in one spot he could not get his iron far enough in the ground. He thrust it in the ground in another place, but still met with hard stone. He began to investigate, and found the largest stone, which was a piece of table flint, measuring 8 or 10 inches across. After removing this he thrust the bar down again, and on withdrawing it again found it had been thrust into a black substance. That led them to investigate the site, with the result that they found several large urns, some of better workmanship than those now uncovered. Two of them were removed to Reading and others were at Southampton and Winchester. They found as many as sixteen, but some were in pieces and were difficult to handle. Some contained nothing but plain earth, and others had burnt flint and bones in them. Dr. Andrews explained that although no trace of bone weapon or metalwork was found, and the calcined remains were too much reduced to give very definite history, it was generally considered by Mr. Shore and the late Dr. Stevens, of St. Mary Bourne and Reading, that it was a burial-place of early Celtic date. Specimens of the vessels were given to Winchester, Southampton and Reading Museums, where they may be seen. No traces of sepulchral mound are visible on this site, nor suggestions of other occupation beyond the bank and ditch just within the copse on the east side. A few rudely-worked flints have been picked up on the field, which Dr. Stevens considered of a rude type of Neolithic age work.

In a discussion which followed, Mr. Shore suggested that the three urns now uncovered after some trouble by Dr. Andrews might go to the British Museum, where Dummer was not as yet represented; their age was "anything over 2,000 years."

At Dummer Church the party was met by the rector (the Rev. G. Jones). The church contains the remains of Norman, Early English and Decorated architecture, as well as old brasses of the fifteenth and sixteenth centuries. An exhaustive paper containing the results of researches carried on during recent years was read by Dr. Andrews, who had collected sufficient information to form an interesting book. From this he read several extracts, dealing mainly with history and with boundaries. As to the church, he pointed out on the south side a blocked doorway with a circular head, suggestive of Norman work, but the curious feature of the massive chancel wall with small openings was probably Saxon work. The corresponding short or apsidal chancel has been replaced by a longer one of Early English type, with lancet windows and priest's door on north side. In the north wall of the nave is a recessed tomb. The porch has small windows and woodwork of Decorated period. The east end is quite recent. The register dated back to 1540, and some of the old Dummer family were mentioned down to 1589. In 1794 there was the signature of George, Prince of Salm-Salm, as witness of a marriage of a sister of the rector. This was during the time that George, Prince of Wales, was tenant of Kempshott. In the Almanack de Gotha there is a present Prince of Salm-Salm, a minor principedom of Luxembourg.

The fine plate, the parish registers, the Jacobean pulpit and the monuments were inspected with great interest under the guidance of the vicar.

After luncheon the party drove through North Waltham (where the recently restored church was admired) and Overton to Quidhampton, where the remains of its ancient Saxon cell were inspected. This, said Mr. Shore, was one of the oldest buildings in the county, and all the authorities agreed that it was Saxon.

The Rev. Canon Stenning joined the members here, and on the way through the fields to Overton Church pointed out the source of the Test at Polhampton, and also one of the four mills mentioned in Domesday Book.

The president of the club, Mr. William Portal, with whom was Mrs. Portal, met the party at the gates of the fine old church of Overton, an interesting account of which was afterwards given by the rector, Canon Stenning.

After welcoming the Society, Canon Stenning said Overton was a very interesting place, and they still dug up Roman coins and Romano-British pottery. He thought that probably near the station the Romans had a fort, because in the garden

of a house there Roman coins are dug up now. The great high road from Silchester to Sarum ran three miles to the north of them, and it might be that the Romans in occupation found it necessary to have a station in the neighbourhood in order to safeguard the supply of water they had at Overton. With regard to the church the porch was quite modern, and the south door also was what was generally a failure, modern Norman, and he was afraid they could not say their church was any exception to the general rule. Sixteenth-century work in the fabric was pointed out by Canon Stenning, and a fine old doorway also referred to. The huge key of the door was of local manufacture, and in the churchwardens' accounts for 1680, something there was payment for was a key made by the village blacksmith. He thought that was the identical key. The great feature of the architecture of the church was its Norman columns, and another interesting thing was the beautiful old roof. In 1855 or 1856 there was a great restoration of the church, but it had not yet been fully carried out, and when it was he hoped they would have a chancel arch more worthy of the church. The old chancel with its thirteenth-century roof still remained exactly as it was put up. The north-east window was Early English, but as the stonework was wearing away they built a new vestry outside it at the restoration, and they hoped that would preserve it. The extreme length of the chancel and its narrowness were commented on.

Mr. Shore then read some notes prepared by him on the history of the church and the parish, giving many interesting extracts from the papal records at Rome, recently made available for historical purposes, and from British Patent Rolls, registers, &c.

After mentioning the fact that he had recently seen the beautiful maps of Overton of Bishop Fox's, which were at Corpus, Mr. William W. Portal said he could never look at the chancel of that church without remembering that as far as his own family was concerned it was there that the Huguenot refugee who founded their family was married. His name was Henri de Portal, and he married Miss Dorothy Hasker, of Northington, in 1715.

The day ended with a most enjoyable visit to Southington, the residence of Mr. and Mrs. William Portal, who extended to the party a cordial welcome. After tea Mr. Portal's numerous souvenirs of travels were inspected with much interest.

Before leaving the grounds the Rev. G. W. Minns proposed a hearty vote of thanks to the president for the way in which he had entertained the club, and Mr. Portal suitably replied.

Basingstoke was reached again about 7.15, from whence the party dispersed in various directions. Everyone taking part in the excursion spent an enjoyable and instructive day, and the warm thanks of all were given to Dr. Andrews and the hon. secretaries for the excellent arrangements.

THE ALFRED JEWEL.

A LETTER from Lady Huggins appears in the *Times*, in which it is said:—

Since 1698, when Dr. Musgrave, a Fellow of the Royal Society, published the first notice of the jewel in the "*Philosophical Transactions*" (No. 247), it has been suggested that the jewel may have been (1) an amulet (Dr. Musgrave's suggestion); (2) a pendant to a chain or collar; (3) an umbilicus, or head of a roller for a manuscript; (4) the top of a stilus; (5) the head of a book-pointer; (6) the top of a standard; (7) the head of a sceptre; (8) an ornament for Alfred's helmet. This last is the recent suggestion of Professor Earle, and is most engagingly presented in his interesting book, "*The Alfred Jewel*."

Without criticising in detail these various views, and before offering a new suggestion or two, I should like to point out, apropos of the book-pointer view—the one favoured by Sir John Evans in his address at Winchester—that the jewel is by no means uncomfortable in the hand. A little experimenting with one of the excellent facsimiles which we owe to the Millenary proves this. Also the view that the jewel may have been the head of a sceptre scarcely seems to have received sufficient consideration. The illumination from the Book of Kells, which Professor Earle refers to for his own view, at least suggests a sceptre with a flat head.

In considering any suggestion as to its probable use, it must be remembered that the Alfred jewel is not unique. A jewel, smaller, it is true, and circular, but of similar structure, with the same provision for a stem or pin, exists in what is known as the Minster Lovell jewel, also in the Ashmolean Museum. The use of the one jewel was, one can hardly doubt, the use of the other.

The motto on the Alfred jewel—"Alfred ordered me to be made"—taken in connection with such other relics as the rings of Queen Ethelswith, King Ethelwulf, and the gold ring with the motto "Ethred me owns, Eanred me engraved," which belong to the same period, points it would seem to the jewel

having been designed (very possibly by himself) as a personal ornament for Alfred.

Is it not worth considering whether the jewel was not used by Alfred as a decorative pin or pin-brooch? Two interesting MSS. of the ninth century support this view. One is a splendid illuminated "*Gospels*" written for the Emperor Lothaire. As was not unusual, a portrait of the Emperor precedes the Gospels. He is represented in his royal robe with the chlamys fastened on the right shoulder by what is evidently a pin with a somewhat large decorated head, enriched with gems. The head of the pin stands up from the robe in a remarkable way. (Du Sommerard Album, Série 8, pl. fig. 4.) The other MS. is "*The Bible of the Monastery of Paul*." At the beginning of this work there is a magnificent representation of Charles the Bald on his throne in full state. Here, too, the chlamys is fastened by an ornament which projects up above the shoulder, and which gives distinctly the impression of being the head of a pin from the way in which it is set in. It is interesting to note that some Benedictines were so struck by the projecting character of the ornament that they actually supposed it represented the head of a sceptre. It is clearly this was a mistake. The ornament is a pin of some sort. (Westwood, J. O., "*The Bib. of the Mon. of St. Paul*."

Smaller and round ornaments are frequently shown in MSS. of the period, holding together cloaks or robes, and though some of these may have been brooches or buttons, others may have been decorated pins. Such pins would represent a separate and extended use of the pin portion of the pin-and-ring form of brooch, specimens of which were often of large size in their two parts, and often very elaborately decorated. It is not difficult to find reasons why the pins for such ornaments as the Alfred and Minster Lovell jewels were attached by rivets. The pins used by the Kabyles, some of which are of large size and form remind one of the Alfred jewel, usually have pins affixed by rivets. There may have been a sliding pin on the pin of the Alfred jewel—as in Kabyle ornament—to catch the pin, which has been lost.

Another but less probable suggestion may be thrown out. The Saxon ladies used long pins for their hair. To this day long pins with large decorated heads are used by the peasant women in many places abroad for sustaining the hair. Conceivably the jewel may have been a gift from Alfred to a queen for such a purpose.

ROMAN CAMP AT DELVINE.

IN the Anthropological Section of the British Association Mr. Thomas Ross read a paper on "*The Roman Camp at Delvine, Inchtuthill*." The camp, the excavation of which has just been completed, is situated on the north bank of the Tay, about six miles down the river from Dundee, in the parish of Caputh. Inchtuthill is a plateau, elevated about 600 feet above the surrounding low-lying fields, which no distant date were probably covered with water. The camp is of triangular shape, about three-quarters of a mile from north to south. About three-fourths of this area is cut off from the camp by a rampart and ditch. The camp is situated in front of Delvine House. It is square, and occupies an area of fully 50 acres. It is defended by a single rampart and ditch on the south, and the rampart is double. On the north the defence is a steep bank of 60 feet. Four circular ovens were found in the east ditch. The "*via principalis*" leads through the centre of the camp down to the river on one side and to the edge of the bank at the other. There is a south gate. At a distance of about 130 yards eastwards there is a similar camp overlooking the river, and defended on three sides by rampart and ditch. It extends to about 5 acres. No gateway entrance was found. A destroyed work, defending the "*via principalis*," was found near the river. In the south-east corner of the inch very complete remains of baths were found, with two brick-built hypocausts and a stoker; one cold water bath 12 feet by 7, with steps and lead pipes; *in situ* hot-air flues, cement floors—one showing indications of having been tiled with various chambers, with four circular apses. At the extreme south horn of the inch there is a very strong fort, extending about 3 acres, of which space more than one-half is taken up by defences. Those against the camp consist of five parallel rows of ditches or ramparts of uncommon depth and height. This is probably a native work. The finds consisted of a few usual Roman pottery, bricks, tiles, lumps of lead, a lead ring (4½ inches by 3½ inches) and a Roman coin found in the floor of a sooty stone hearth.

Sir John Evans, in the course of some remarks, said that the existence of the baths at Inchtuthill gave colour to the impression that there had been a lengthened occupation of the camp. These excavations threw light on what was a dark part of the Roman occupation of the southern part of Scotland.

The author was thanked for his paper, and a vote of thanks was also passed to Hon. John Abercromby, who defrayed the expense of the exploration.

OGHAM WRITING IN IRELAND.

PAPER on "The Age of Ogham Writing in Ireland" was read by Mr. R. A. S. Macallister, Cambridge, before the meeting of the British Association. The question whether ogham writing was of a Christian or Pagan origin was not yet settled. There was a large proportion of inscriptions in this character found associated with Christian graveyards or churchyards, or bearing Christian symbols, and these might hesitatingly be put down as Christian monuments. But there were some monuments even of this class which showed evidence of appropriation, and whose inscriptions might antedate the crosses cut upon them. In these cases the Pagan and Christian period overlapped. The stones not marked with crosses they had been accustomed to look upon as pre-Christian. He showed on the screen examples of four classes of these stones. The first was from a tumulus between Tralee and Dingle. The mound was of stones and earth overgrown with furze, round which were little standing-stones, two of them with names inscribed. It was called in the neighbourhood "The little hill of blood." The second type was a rude standing-stone of which few examples existed. He showed one at Craggs, near Tralee, and it was interesting as the latest monument to a poet in the British islands. The third type of stone was the alignment. Of this he showed an example from a hill-top at Dromatouk, near Kenmare, and the fourth was a standing-stone on a lonely moor on Kenmare river. The lesson drawn from these and similar monuments was that the majority of the existing inscriptions were certainly Christian in origin. There were several of whose Christian nature it was at least legitimate to admit a doubt, and if the doubt was well founded the origin of the ogham script must be traced back into the pre-Christian period.

Mr. Coffey said that so many extravagant statements had been put forward with regard to this subject that scientific men were disposed to fear that their reputations would suffer by being associated with it. But Mr. Macallister had shown a higher courage, and his paper was of the greatest value.

ASCOT RACECOURSE.

PREPARATIONS have been begun at Ascot for the erection of the extensive buildings which by the King's command are to replace the old royal and other stands recently demolished upon the south side of the racecourse. The architect is Mr. C. W. Stephens, of Hans Road, Brompton, and the work has been entrusted to Messrs. John Allen & Sons, of Wilburton, who have already taken possession of the ground, which is being got ready for the foundations by a number of labourers. Instead of the heterogeneous group of buildings almost swept away there will be three commodious and well-appointed stands. The new Royal stand will be situated between those of the Jockey Club and the Master of the Horse and Lord Chamberlain, its position being similar to that which the old building occupied. It will be 70 feet in length and 10 feet high. Panelled balconies projecting from the front will overlook the course, and the verandahs above are to be covered with copper. The lawn will be reached by two curved staircases leading down from the principal tier and sheltered by a canopy, also roofed with copper. The brick wall at the rear will be provided with an ornamented iron portico, where the Royal or other visitors will alight or enter their carriages. The Jockey Club stand will be placed next the subscribers' private stand, which latter, as well as the clock tower and grand stand, remain as they were. It is to be 6 feet 9 inches in length and 54 feet high, and will have a light iron roof for an awning and verandahs facing the heath. Dressing-rooms and other apartments will be provided in the building, and there will be separate entrances for members and visitors. The third stand, which will be reserved for the Master of the Horse, the Lord Chamberlain and others, is the largest of the group. It will be erected on the west of the Royal stand, and here Major Clements and the clerks will have offices. Staircases will lead to the Press stand, accommodation will be provided for owners and jockeys, and there will be several luncheon-rooms and lifts. The work is to be finished by April next.

TESSERÆ.

Unity in Architecture.

WITHOUT unity and without harmony architecture lacks an essential of its true character, and fails in its true mission. An imperfect art may continue to satisfy the cravings of an indifferent multitude, but it will never elevate nor refine. Moreover, in order to confer any real or lasting benefit upon men, that art must be something like universal; not a little bit scattered here and there, one portion teaching one lesson, and another the reverse; one man pulling one way, and one another; but each one must aid the other by the communication of his own experience and knowledge. Not at random,

imparting all he knows to the whole community, but freely to all members of his own fraternity; and then, if all members mutually agreed to place themselves under one code, and to follow the same principles, all being bound together by the same interests and in the same common cause, not deviating, either for fear or favour, from their self-imposed restraint, what weight would they not have in forming the standard of taste, what influence with all the non-professional community who have the true interests of our art at heart, what confidence amongst those who are at present uncertain and indifferent about the way in which architectural works are to be carried out. Any number of men, however small, thus bound together, all prosecuting the same ends, all employing the same means, cannot but carry with them over the works of a whole community a weight and influence which any number of men in an independent and isolated position could never gain. Self, self, self is the bane of art as it is of social life, even though a certain amount of self-interest is needful for self-preservation. Not that the individual must needs be by any means merged in such an aggregation and combination of units, for each separate spark of genius would still shine forth with increased lustre, whilst the sphere of its influence would be manifoldly increased, extending as it then would through those immediately surrounding it to an unthought-of and unlooked-for distance. The individual would still hold his own; he would lose nothing, and he would gain much by his new position. For one may as well try to smother a flame of fire in a barrel of gunpowder as to stifle the aspirations of genius in the trammels of routine.

The Pomoerium, or Symbolic Wall.

The custom of making a pomoerium was common to the Latins and Etruscans, and the manner in which it was done in the earliest times, when a town was to be founded, was as follows:—A bullock and a heifer were yoked to a plough, and a furrow was drawn around the place which was to be occupied by the new town in such a manner that all the clods fell inward. The little mound thus formed was the symbolical wall, and along it ran the pomoerium, within the compass of which alone the city auspices could be taken. That the actual walls or fortifications of a town ran near it may naturally be supposed, though the pomoerium might either be within or without them. This custom was also followed in the building of Rome, and the Romans afterwards observed it in the establishment of their colonies. The sacred line of the Roman pomoerium did not prevent the inhabitants from building upon or taking into use any place beyond it, but it was necessary to leave a certain space on each side of it unoccupied so as not to unhallow it by profane use. Thus we find that the Aventine, although inhabited from early times, was for many centuries not included within the pomoerium. The whole space included in it was called *ager effatus* or *finis effati*. The pomoerium of Rome was not the same at all times; as the city increased the pomoerium also was extended, but this extension could, according to ancient usage, only be made by such men as had by their victories over foreign nations increased the boundaries of the empire, and neither could a pomoerium be formed nor altered without the augurs previously consulting the will of the gods by augury, whence the *jus pomoerii* of the augurs. The formula of the prayer which the augurs performed on such occasions, and which was repeated after them by the people who attended, is preserved in Festus. The original pomoerium of Romulus ran, according to Gellius, around the foot of the Palatine, but the one which Tacitus describes as the pomoerium of Romulus comprised a much wider space, and was, as Niebuhr thinks, an enlargement of the original compass, taking in a suburb or borough. Niebuhr also believes that pomoerium properly denotes a suburb taken into the city. Servius Tullius extended the pomoerium, but the Aventine was not included, either because the auspices here taken by Remus had been unfavourable, or, which is more probable, because there stood on this hill the Temple of Diana, the common sanctuary of the Latins and Romans. Dionysius states that down to his time nobody had extended the pomoerium since the time of King Servius, although we know from authentic sources that at least Augustus enlarged the pomoerium, and the same is said of Sulla and Julius Cæsar. The last who extended the pomoerium of Rome was the Emperor Aurelian, after he had enlarged the walls of the city.

Sixteenth-Century Architecture.

During the sixteenth century Gothic architecture gradually declined till it became almost extinct, and a semi-Grecian style took its place, in which, nevertheless, Gothic features were occasionally employed. Sir Christopher Wren's London churches are mostly of this description. The introduction of this debased style took place on the Continent earlier than in England, and if it be true that the dissolution of the monasteries in this country checked church building and church restoration, there can be little doubt that fewer remains of the Middle Ages would have been handed down to us had they remained. Church restoration and church building would

have been prosecuted with all the old activity, but in the spirit which originated St. Peter's, at Rome, and replaced old St. Paul's with the present Italian structure. Now that architectural knowledge has attained a high standard among us, while we rejoice at every new instance of correct and yet conservative restoration, some are occasionally heard to express regret that much was done before sufficient knowledge was attained. Had the zeal for church restoration sprung up 300 years ago, without doubt many of the great cathedrals would have been irreparably disfigured and Mediæval Oxford itself "Italianised" throughout. While the pseudo-Classical styles were brought into general use first on the Continent, and afterwards in England, Gothic architecture lingered at Oxford. Wadham College is a remarkable example, the chapel of which is well known for its apparently fifteenth-century architecture, and yet it was built in the reign of King James. The hall of Exeter College is of the same date, and equally good: the greater part of Jesus College and the Fellows' Quadrangle at Merton were also built at a period when Gothic architecture was elsewhere a lost art. The Schools are believed to be of the same date, and Gothic of a kind, but not likely to be ever very much admired. The famous staircase to the hall at Christ Church was built in 1640, and though meagre in some of its details, all must admit that the design and effect are worthy of the fifteenth century.

Revenues of Greek Temples.

In ancient times every temple of any importance had property belonging to it, besides its furniture and ornaments, and a treasury where such property was kept. Lands were attached to the temple, from which rents accrued; fines were made payable to the god; trophies and other valuables were dedicated to him by the public, and various sacred offerings were made by individuals. There were officials who had the custody and management of these funds. The wealthiest of all the temples at Athens was that of Minerva in the Acropolis, in which were kept the spoils taken from the Persians, besides magnificent statues, paintings and other works of art. To the goddess large fines were specially appropriated by the law, or given by decree of the courts or the assembly, and besides this she received a tenth of all the fines that went to the state, a tenth of all confiscations and prizes taken in war. Her treasurers were called "tamiai." They appear to have existed from an early period. Herodotus relates that the tamiai, with a few other men, awaited the attack of Xerxes upon the Acropolis and perished in its defence. They were ten in number, chosen annually by lot from the class of Pentacosiomedimni, and afterwards, when the distinction of classes had ceased to exist, from among the wealthiest of Athenian citizens. The treasurers of the other gods were chosen in like manner, but they, about the 90th Olympiad, were all united into one board, while those of Pallas remained distinct. Their treasury, however, was transferred to the same place as that of Minerva, viz. to the Opisthodomus of the Parthenon, where were kept not only all the treasures belonging to the temples, but also the state treasure, under the care of the treasurers of Pallas. All the funds of the state were considered as being in a manner consecrated to Pallas; while, on the other hand, the people reserved to themselves the right of making use of the sacred moneys, as well as the other property of the temples, if the safety of the state should require it. Payments made to the temples were received by the treasurers in the presence of some members of the senate, just as public moneys were by the apodectæ, and then the treasurers became responsible for their safe custody.

Old English Gardens.

The only purpose contemplated in the formation of an English garden appears to have been an enclosed place in which the owner might walk in seclusion, or in which sport might be had with contrivances like mazes and labyrinths formed of close-cut hedges; a few fruit trees were added, but no such object as that entertained by the refined Italians of collecting rare and beautiful plants from foreign countries for pleasure or for scientific purposes, was thought of. In the gardens of Nonsuch, the palace of Henry VIII., executed about the year 1540, we hear of shady walks, columns and pyramids of marble, fountains that spout water one round the other like a pyramid, upon which are perched small birds that stream water out of their bills and of similar objects, but nothing of the more essential part of a garden—its plants. Pleasure-grounds of this description had existed in England from the time of the Conqueror. Antiquaries have rarely attended to the subject, and a rich field of investigation certainly still remains open to whomsoever is disposed to enter upon it. It is stated by Fitzstephen that in the time of Henry II. (1154-89) the citizens of London had large and beautiful gardens to their villas. In the reign of Edward I. (1272-1307) it may be collected from "Holinshed's Chronicle," that the cultivation of the garden was extended to the more curious and delicate productions, but the wars of York and

Lancaster destroyed all these occupations, and gardens general ceased to be more than pleasure-grounds or kitchen gardens of the rudest kind till the time of Elizabeth. King James I. of Scotland describes the garden at Windsor Castle where he was confined by Henry V., as a place set thick with trees and alleys of hawthorn hedges, with an arbour in each corner. Much later (1512) the great Earl of Northumberland whose household consisted of 160 persons, "had but a gardener, who attended hourly in the garden for setting out and clipping of knottis, and sweeping the said garden clean. Nay, it should seem as if sometimes there was not even one, for among the workmen of the household is mentioned the gardener of the place where my lord lyeth, if he be one."

Red Gum Paving.

SIR,—Permit me to make a correction to your preface copy of my report on "Red-gum Paving" in your issue of September 20, p. 22. I am not employed by the Colonial Office, and should much regret that this statement should be uncorrected. My work, which is the discrimination of various kinds of timber by means of their anatomical character, is specially useful in new countries, and particularly applicable to the colonies, and has the very kind approval and most valuable assistance of the Colonial Office.—Faithfully yours,

Little Hay House, near Lichfield: HERBERT STONE.
September 22, 1901.

GENERAL.

A Public Meeting was held at Newcastle last week where it was resolved to erect a statue and complete the buildings of the College of Science, in memory of the late Lord Armstrong.

The Marquis of Bute has accepted an invitation to lay the foundation-stone of the new town hall at Cardiff on October 23. On the same date the Mayor of the borough will preside at the stone-laying of new law courts there.

M. J. Bouvart, principal architect to the city of Paris and of the Universal Exposition of 1900, has received the Grand Cordon of the Order of St. Anne from the Emperor of Russia.

The Dover Corporation ordered last Tuesday that all classified advertisements should be removed within a fortnight.

The Foundation-stone of a new church to be erected at Blackham, Sussex, was laid last Monday. The total cost will be £1,256. The church will consist of a nave and chancel with a stone bell turret. It is being built of stone from the Hackenden quarry at East Grinstead, with Bath stone dressing prepared by Messrs. Jenner & Grynner, of East Grinstead. Mr. Charles Day, of Cowden, is the builder, and Mr. Lacy V. Ridge, the architect. The accommodation to be provided for 156 persons.

A Runic Cross has been erected at Ship Hill, Chobham, as a memorial of Queen Victoria, and was unveiled this week. The cross, together with a cannon used in the Crimean war, has been placed on the common at Chobham, where the late Queen reviewed her troops before they left for the Crimea.

The Death is announced of the well-known landscape painter, Professor Karl Ludwig. He was born in 1839, at Römhild, in Saxe-Meiningen, and studied painting at Munich under Piloty. His favourite subjects were Alpine scenes.

An Inquiry was held at East Grinstead on Tuesday respecting the application of the Urban Council to borrow £5,800 in order to provide working-class dwellings.

The Application by the British Electric Traction Company, Ltd., for an order to construct light railways within the borough of Crewe, and from the borough to Haslington, has been refused. The proposed lines were a little more than six miles in length, and were estimated to cost £73,000.

The Edinburgh Architectural Association has acquired new rooms, and the address in future will be 117 George Street, Edinburgh.

Messrs. Doulton & Co., Limited, announce that owing to the largely increased demand for their manufactures, and in order to meet the convenience of their numerous clients in the Midlands, they have opened commodious showrooms in a central position at 30A Paradise Street, Birmingham, for the display of high-class sanitary fittings of every description, and specialties in glazed fireplaces, wall panels, &c. The showrooms will be in addition to their existing wharf at Granville Street.

Mr. Fredk. E. Bristowe, engineer, informs us that he has changed his office address to 12 Dartmouth Street, Queen Anne's Gate, Westminster, S.W.

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

SHEFFIELD.—Sept. 30.—Designs are invited for a Memorial to Her late Majesty, Queen Victoria, on the site now occupied by the monolith in Fargate, such Memorial to include a statue of Her late Majesty. Prizes of 100l., 50l. and 25l. respectively will be awarded to the three best of the unsuccessful competitors. Messrs. Wm. E. Clegg & George Franklin, honorary secretaries, Town Hall, Sheffield.

CONTRACTS OPEN.

ALDERSHOT.—Oct. 1.—For opening, filling and making good trenches for electric-light cables and mains. Mr. W. E. Foster, clerk to Urban District Council, Council Offices, Aldershot.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

BARKING.—Oct. 9.—For erection of an entrance-lodge, tool-house, building, and cart-shed at the recreation-ground, Longbridge Road, Barking, Essex. Mr. C. F. Dawson, surveyor, Public Offices, Barking.

BEXHILL.—Oct. 4.—For erection of the new coastguard buildings at Bexhill, Sussex, consisting of houses for an officer and twelve men, boathouse, watchroom, &c. Contract particulars may be seen at the Director of Works Department, Admiralty.

BIDEFORD.—Oct. 5.—For sewerage works in connection with the sewerage and disposal of the sewage of East-the-Water, Bideford. Mr. Baldwin Latham, Parliament Mansions, Victoria Street, Westminster.

BIRMINGHAM.—Oct. 8.—For erection of receiving wards, porter's lodge and new pavilion, stores and offices, workshed, at the workhouse, Selly Oak. Mr. Edwin Docker, clerk to the Guardians, 10 Newhall Street, Birmingham.

BRAINTREE.—Oct. 1.—For pulling-down and rebuilding two gables, returns and porch of chapels and two gate piers at Baintree cemetery. Messrs. A. & H. J. Cunningham, clerks to the Urban District Council, Baintree.

BRIDLINGTON.—Oct. 8.—For erection of central schools and caretaker's residence at Oxford Street, Bridlington. Mr. J. Earnshaw, architect, Bridlington.

BRIDLINGTON.—Oct. 8.—For heating the Central schools with hot-water (low pressure). Mr. J. Earnshaw, architect, Bridlington.

BRIGHTON.—Oct. 1.—For reroofing a covered way in the exercise yard adjoining the south ward at the workhouse, Elm Grove. Mr. B. Burfield, clerk to Guardians, Parochial Offices, Brighton.

BRISTOL.—Sept. 30.—For erection of an infants' school and special class centre at Wilson Street, St. Paul's. Messrs. Philip Munro & Son, architects, 6 St. Stephen's Chambers Baldwin Street, Bristol.

BRISTOL.—Oct. 1.—For erection of ten workmen's dwellings on the west side of Mina Road, Bristol. Mr. T. H. Yabbicom, city engineer, 63 Queen Square, Bristol.

BUCKFASTLEIGH.—Oct. 15.—For following works in connection with the water-supply scheme, viz.:—(Contract No. 1) covered service reservoir; (2) excavating and laying about six miles of 4-inch and 3-inch cast-iron pipes and other works in connection therewith; (3) supplying about 150 tons of 4-inch and about 80 tons of 3-inch cast-iron pipes, together with all the necessary special pipes required. Mr. T. W. Stainthorpe, engineer, Gate House, Totnes, Devon.

BURLEY-IN-WHARFEDALE.—Oct. 1.—For supplying, laying and jointing of 1,548 yards of 6-inch cast-iron socket pipes and 850 yards of 3-inch cast-iron socket pipes, with sluice and air valves, &c., at Burley-in-Wharfedale. Mr. Malcolm Pater-son, engineer, 35 Manor Row, Bradford.

CAMBORNE.—Oct. 1.—For erection of a dwelling-house at Barrigger Road, Camborne, Cornwall. Mr. J. F. Pearce, Camborne.

CARLISLE.—Sept. 30.—For erection of four houses, Courtfield Gardens, Warwick Road, and two houses in Close Street. Messrs. Briggs Bros., Market Street, Carlisle.

STURTEVANT

SYSTEM OF

Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,
147 QUEEN VICTORIA STREET, LONDON.
GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

CARLISLE.—Oct. 1.—For erection of seven houses in Melbourne Road. Mr. James Beaty, Old Post Office Court.

CHEADLE.—Oct. 7.—For erection of mortuary buildings and chapels at the new cemetery, Stockport Road, Cheadle, Cheshire. Mr. Geoff. H. Brady, architect, 18 Little Underbank, Stockport.

CHELTENHAM.—Oct. 30.—For erection of a town hall on the winter garden site. Messrs. Waller & Son, architects, 17 College Green, Gloucester.

COLCHESTER.—Oct. 14.—For heating the whole of the workhouse and suppling the baths, lavatories, &c., with hot water; also for supplying and fixing baths and sinks. Mr. Charles E. White, 57 North Hill, Colchester.

CONISTON.—Oct. 7.—For additions and alterations to the Sun hotel, Coniston. Mr. John Y. M'Intosh, architect, 6 Cornwallis Street, Barrow-in-Furness.

DALSTON LANE, N.E.—Sept. 30.—For erection of a portion of the new building for the North-East London Institute. Mr. Arthur W. Cooksey, architect, 4 Adam Street, Adelphi, W.C.

DEVIZES.—Oct. 12.—For erection of new visiting-rooms at the Wilts county pauper lunatic asylum, Wilts. Mr. Charles S. Adye, county surveyor, County Offices, Trowbridge.

EAST DONYLAND.—Oct. 12.—For sinking a borehole in the parish of East Donyland, Essex, to obtain a supply of water. Messrs. Sands & Walker, engineers, Angel Row, Nottingham.

ENFIELD.—Oct. 2.—For sinking a well, lining same with cylinders, driving adits, &c, on the site of the new pumping-station, Hadley Road. Mr. Richard Collins, surveyor, Court House, Enfield.

ERITH.—Oct. 7.—For construction of a galvanised iron building to accommodate twelve patients, as an extension of the infectious diseases hospital. Mr. Charles H. Fry, clerk, District Council Offices, High Street, Erith.

ERITH.—Oct. 8.—For constructing sewers, screen chamber, &c. Engineer's Department, County Hall, Spring Gardens, London, S.W.

FELIXSTOWE.—Oct. 2.—For erecting seven groynes in front of Hamilton Terrace. Mr. F. B. Jennings, town clerk, Felixstowe.

GATESHEAD.—Sept. 30.—For additions to offices in Swinburne Street. Mr. J. Bower, borough surveyor, Gateshead.

GATESHEAD-ON-TYNE.—Sept. 30.—For extensions to wire rope factory of Messrs. Dixon & Corbitt and R. S. Newall & Co., Ltd., Teams, Gateshead-on-Tyne. Messrs. Marshall & Tweedy, architects, 4 Northumberland Street, Newcastle-on-Tyne.

GREAT YARMOUTH.—Oct. 1.—For erection of cemetery chapel, superintendent's lodge, office, toolhouse, entrance gates and fencing at Caister. Mr. J. W. Cockrill, borough surveyor, Town Hall, Great Yarmouth.

HALIFAX.—Oct. 1.—For erection of stalls, &c., at the Borough Markets (late fish market). Mr. James Lord, borough engineer, Town Hall, Halifax.

HALIFAX.—Oct. 2.—For supply of a lathe at the tramway dépôt, Skirecoat Road. Mr. F. Spencer, tramways manager, Skircoat Road, Halifax.

HALIFAX.—Oct. 2.—For erection of a mild-steel overhead storage cistern at the tar-works, Charlestown Road. Mr. Thomas Holgate, gas engineer, Town Hall, Halifax.

HALIFAX.—Oct. 10.—For erection of stabling for twelve horses, cart-shed, &c, at Stone Trough Brewery. Mr. W. H. D. Horsfall, architect, Tower Chambers, Halifax.

HARROGATE.—Oct. 2.—For erection of steam laundry at Starbeck. Mr. F. Bagshaw, borough surveyor, Municipal Offices, Harrogate.

HINDLEY.—Sept. 30.—For erection of a residence on Castle Hill, Hindley, Lancs. Messrs. Heaton, Ralph & Heaton, architects, Wigan.

HORNCHURCH.—Oct. 2.—For erection of school to accommodate 200 boys and 200 girls at Hornchurch, Essex. Mr. S. J. Adams, architect, Weston Chambers, Weston Road, Southend.

HORNSEA.—Sept. 30.—For extension and removal of ereosoted wood fencing at the cemetery, Southgate, Hornsea, Yorks. Mr. W. G. Warburton, surveyor, Public Rooms, Hornsea.

HOUNSLOW.—Sept. 30.—For erecting twenty-two houses for the working classes. Mr. P. G. Parkman, surveyor, Town Hall, Hounslow.

TRADE NOTES.

THE entire warming, ventilation and hot-water supply for the new reading-room, baths and club at Tankersley is being carried out by Messrs. John King, Ltd, engineers, Liverpool.

THE ventilation of Coal Clough school, Burnley, has been carried out by means of Mackay's patent direct-acting ventilators, supplied by the sole makers, Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester

WE have received from Mr. James Melling, Dashwood House, E.C., particulars of the Pure Air Radiator, the heat being generated by the current from any electric supply main, further particulars of which we hope to give in our next issue

A LARGE clock has just been erected upon the parish church of Little Gransden, Herts, which strikes the hours upon the largest church bell and shows time on a large dial facing north. The work has been carried out by Messrs John Smith & Sons, Midland Clock Works, Derby.

MESSRS. PARKER'S JOINERY AND CABINET COMPANY, LTD., of Conybere Street, Birmingham, write us that they have been instructed by the Birmingham city surveyor to erect two pavilions for the accommodation of extra nurses at the Fever Hospital, Yardley, and also instructions from Dr. Beazeley, the medical superintendent, for the furnishing of these pavilions, and several other articles of furniture for other parts of the hospital. A contract has also been accepted for the whole of the joiners' and cabinetwork in the erection of a new billiard-room and other extensions to the house of Mr. F. Bowden at Nottingham, and another by Mr. E. Fletcher for the supply of the whole of the internal fittings to the new extension at the Louvre, High Street, Birmingham.

THE NEW CATHEDRAL, WESTMINSTER.

PROPOSED HOUSES AT HAMPSTEAD; LISS, HANTS; AND
WALTON-ON-HILL, SURREY.**VARIETIES.**

THE memorial-stone of Prestwick, N.B., High school was laid on Monday.

AT Southend on Tuesday Lord Avebury laid the foundation-stone of the new technical schools which are being erected there at a cost of upwards of 19,500*l*.

THE Bishop of Rochester dedicated the new church of St. Thomas, Telford Park, Streatham Hill, on the 19th inst. The building, which is not yet finished, will on its completion have cost 12,000*l*.

AT Grimsby on Tuesday the foundation-stones of the new Harold Street Board schools were laid by Mr. J. Whiteley Wilkin, vice-chairman of the Board, and the Rev. Father Hawkins, a member.

THE Countess of Derby has consented to open the Liverpool Sanatorium at Delamere Forest on the 18th proximo. The foundation-stone of this building was laid by Lord Derby on the 6th of October last.

AN open competition resulted in twenty designs being submitted for a proposed new market hall, &c., at Llanrwst, in North Wales. The successful competitor is Mr. E. Grubb, of South Shore, Blackpool, to whom the premium of 20*l*. has been awarded.

A NEW college which has been erected on the Weaponness estate on the Southcliff at Scarborough was opened on the 18th inst. The cost of the building and site has been about 11,385*l*., and when the grounds are laid out the approximate total cost will have been 13,000*l*. The accommodation of the building is for 100 boarders.

A NEW church for the United Methodists of Lambeth was opened on Saturday. It is situated in a prominent position in Fentiman Road, South Lambeth, and has been erected in place of an old building in Miles Street, which has served its purpose for over half a century. It has, with the schools adjoining, cost altogether 10,500*l*.

THE employes of Messrs. Stanley, opticians, of Great Turnstile, Holborn, experienced a shock on Monday morning, when on opening the premises they found the remains of Percy Coles, a young clerk who, as shown at the inquest, committed suicide by taking cyanide of potassium on Saturday afternoon, and had lain where fell till discovered some forty-five hours after.

AT Balterley, Staffs, which has been erected by his widow as a memorial of the late Mr. Thomas Fletcher-Twemlow, of Betley Park, was opened on the 19th inst. by the Bishop of Chester. It has been built from the designs of Messrs. Paley & Austin in Accrington red brick, with red sandstone dressings. It is 55 feet long by 17 feet 6 inches wide, and affords accommodation for about 100.

THE new waterworks which have been erected for the burgh of Wishaw, at a cost of upwards of 100,000*l*., were formally opened at Peden, in the parish of Crawford, on the 19th inst. The water, which is of excellent quality, is drawn from three burns—the Potrail, Portrenick and Peden—rising in the Lowthers, in the borders of Dumfriesshire, and pipes have been laid capable of delivering 2,220,000 gallons per day.

THE Mayor of Chester opened on Wednesday the new public baths which have been erected in that city, at a cost of close upon 13,000*l*. Hitherto the only baths in Chester have been the floating structure on the Dee, and better provision has long been strenuously advocated by the citizens. The new baths are up to date, and rank amongst the finest in the country. There are two large plunge baths, slipper and vapour bath for men and women, &c.

HORSFORTH CHURCH, which was erected about twenty years since from the designs of the late Mr. J. L. Pearson, R.A., has only now been completed. The tower, which stands at the south side of the chancel, was then left temporarily roofed at a height of 58 feet, and has now been carried to a height of 83 feet, to the design of Mr. James B. Fraser, of Leeds. The spire rises to a height of 173 feet, and within the belfry is of sufficient size to accommodate a peal of eight bells, but as yet no arrangement has been made for these.

200-215
TOTTENHAM COURT ROAD
(Opposite Goodge Street),
LONDON, W.

HUISH EPISCOPI CHURCH, Somerset, was on Sunday evening, just after the festival service, the scene of a curious accident. The tower is one of the finest in the county and contains five bells, the tenor weighing one ton. They were being rung down when the entire cage, 70 feet above the floor, collapsed. Fortunately the falling mass jammed before reaching the floor on which the ringers were. In the vestry below were the vicar (the Rev. J. Stubbs) and the Rev. Edgar Hornsby. The tower was much damaged. Nobody was injured.

AT Golders Green, among the open fields to the north of Hampstead Heath, the London Cremation Company have acquired 12 acres of land, which will be set apart for the cremation of the dead. A beautiful chapel is being built, the design of which, by Mr. Ernest Yeates, was exhibited at the Royal Academy this year, and the grounds, instead of being a wilderness of gravestones, will be laid out as a pleasantly-wooded garden, surrounded by arched cloisters containing niches for the urns and caskets of the departed.

THE Oldbury Urban District Council are making application to the Local Government Board for a provisional order authorising them to put in force the powers of the Lands Clauses Consolidation Act, 1845, to enable the Urban Authority to purchase otherwise than by agreement land situated at Warley, which is required for the erection and construction of a pumping station and other works in connection with the scheme for the sewerage of the Warley district. The total quantity of land in respect of which the compulsory powers of purchase are sought is over 2 acres.

THE great east window of Dunblane Cathedral, which has been filled with stained glass at the expense of Mrs. Hay, was dedicated on Sunday last. The two side lancet windows are filled with figures of the Prophets David, Micah, Isaiah, Jeremiah, Jonah, Ezekiel, Hosea and Zechariah. Between the central mullions are scenes in the closing life of Christ, beginning with the "Agony in the Garden," "Christ before Pilate," "Procession to Calvary," "Crucifixion," "Charge to St. Peter," "Appearance to Mary Magdalene," the last scene being "The Burial of Christ." The whole colouring is a fine example of the glass-stainer's art.

COUNT SUZOR, the president of the Russian Theatre Safety Commission, who is now on a visit to London inquiring into the effect of our regulations, was entertained at luncheon at the Carlton Hotel by Mr. Edwin O. Sachs, chairman of the British Fire-Prevention Committee, to meet the chairmen of

the sub-committees, the chief officer of the Salvage Corps, and other experts on the subject. Count Suzor afterwards inspected the committee's new testing-station with a view of creating similar facilities for research at St. Petersburg, under a scheme mooted in connection with the terrible fire losses which have occurred in Russia during recent years.

AN addition to the church of St. Saviour, Ravensthorpe, Yorks, has been opened by the bishop of the diocese, Dr. Eden. Mr. W. Hodgson Fowler, architect, of Durham, has designed the extension in thirteenth-century Gothic, and, as far as carried out, it consists of chancel, transepts (with a rose-window in the south transept), morning chapel, organ-chamber, enlarged vestry, &c. These are completed, and form the portion just consecrated. There remains to be added a tower to occupy the site of the present campanile, and a clerestory and arcading for the nave and north aisle. The cost of the whole will be 8,600*l.*, and seats will then be provided for 850 persons.

THE Knaresborough Urban Council is carefully considering the advisability of introducing a Bill in Parliament for further improvements in the town. One of the principal projects is to establish a public market. The present offices used by the Council are not considered suitable, and power will be sought to erect a council chamber and offices. The erection of a public slaughter-house, the closing of existing slaughter-houses, the extension of the Council's area of supply for gas and water, the control of boating on the Nidd at Knaresborough, the provision of electric light and power, the laying of tramways, and the purchase of a recreation-ground are other items in the proposed new Bill.

THE famous building south of Wych Street, which was known as the birthplace of Jack Sheppard, is now being demolished in the course of clearing the site of the new street from the Strand to Holborn. It was a dwelling-house with gabled roof and projecting window, and was among the first sights to be seen by Americans on a visit to this country. Further down the street was another old-fashioned building, now, however, razed to the ground; and it is said that it is here that Jack was apprenticed to Woods, the carpenter, and where his master found his apprentice busily engaged, not at his legitimate work, but in carving out on a huge piece of wood the words "Jack Sheppard."

MARYPORT Harbour Commissioners have received the report of Messrs. Baker & Hurtzig, the engineers called in to advise on the improvement of the dock. They recommend a

new entrance to Senhouse Dock, 60 feet wide and 29 feet deep, the dock to be widened 140 feet and deepened, the construction of a timber jetty and new quay, and an installation of hydraulic power, at a cost of 148,000*l*. The report goes on, "For the trade dealt with at Maryport, steamers of 500 feet length may become common, and this would involve the entire reconstruction of the port at three or four times the present estimate." The Commissioners' idea, in view of the difficulty of raising the money, was to limit the expenditure to 100,000*l*.

MR. THOMAS FLETCHER, of the firm Fletcher, Russell & Co., gas engineers, Warrington, has issued a circular to the employes of the firm in which, after referring to a presentation which he made to them at an excursion to which he had invited them with their wives and families, in celebration of his silver wedding, goes on to say:—"We have grown since, and at Christmas next, as a memorial of my thirtieth year in connection with the gas industry, I shall have the pleasure of presenting the employes with the sum of 1,000*l*. in cash. No man will receive less than 5*s* and no youth less than 2*s*. 6*d*. in any case. All in Warrington, Pendleton, Manchester and London will participate equally; no preference will be shown. The amount will be paid in cash on the day before Christmas next.

THE new waterworks just completed at Craigendunton, on the Fenwick moor, about eight miles from Kilmarnock, were formally opened on Saturday. The water supply undertaking was acquired from a private company in 1892, and in order to meet the growing wants of the community a new reservoir was projected. Considerable engineering difficulties were encountered, and the operations have occupied nearly six years. The scheme was designed by Messrs. Leslie & Reid, Edinburgh, and after the death of the senior partner of that firm, Mr. Wilson, the work was taken in hand by Mr. Niven, C.E., Glasgow, by whom it has been successfully carried through. The reservoir covers an area of about 30 acres, and its greatest depth is about 40 feet, while the storage capacity is 135,000,000 gallons, the source of supply being the Dunton burn and tributaries. The total cost of the undertaking, including price of land, piping and three large filters and a clear water tank at Amlaird, is fully 62,000*l*.

COLEY CHURCH, Yorks, which has been closed for about eight months, in the course of which it has undergone a process of renovation and improvement, was reopened on the

14th inst. The architect for the work is Mr. J. Hodgson Fowler, of Durham, and under his supervision quite a metamorphosis has taken place. The floors have been removed and the whole area covered with cement concrete, above which is laid a solid wood-block flooring. A new chancel has been formed in the two eastern bays of the nave, and the organ placed on the side at the end of the north aisle. The old vestries are removed and new ones take their places—one for the choir opening out of the north aisle and the other for the clergy from the east aisle. The removal of the organ from the west end opened out a large space, where a gallery has been built large enough to accommodate about a hundred persons, and thus the seating capacity of the church is much enlarged. The old system of heating was found inadequate, and a new hot-water apparatus has been fixed. In addition to these changes the whole interior of the edifice has been thoroughly cleaned and decorated in quiet but tasteful colours, and the whole of the woodwork in the pews, gallery, &c., being of plain dark oak, a good effect is obtained.

NORTH MORNINGSIDE United Free church, Edinburgh, which has been closed for nearly two months, having undergone complete renovation, was reopened on Sunday. The church is one of the finest examples of Norman architecture in the city, and with so fine a building to work upon the adoption of a harmonious colour scheme was most important. The interior is mainly lighted by the clerestory windows, and the walls above the string-course, on which the whole of the shafts of the windows seem to rest, have been treated in a fine quality of yellow, while a very soft red has been adopted on the walls between the string-course and the spandrel spaces above the arches. The walls of the aisles and under the gallery are painted in a much richer red. A similar treatment has been given to the great arch which divides the chancel from the body of the church. The side walls of the chancel are treated in full red, enhancing the appearance of the chancel, while it tones well with the front pipes of the organ, which are in solid gilding. The woodwork of the pulpit and platform are in dark oak colour, finished with dull varnish. Additional touches of colour and gilding are introduced by the rich treatment of the capitals of the pillars supporting the gallery. The hall and offices of the church have also been renovated. An important improvement has been the introduction of electric light throughout the church buildings. The whole of the outside stonework of the church has been cleaned and repointed.

FISHBURN'S LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c.

The cost of the Winch saved in a few weeks.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building. By a simple and expeditious arrangement it can be made to lift or lower at two or more points (or hatchways) to suit the floor spaces.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

CELTIC CROSSES A SPECIALTY,

*Studied from Ancient Crosses,
And every available example of Celtic Art.*

The wonderful durability of IRISH LIMESTONE is well-known.

A SPECIAL meeting of the Stretford (Lancs.) District Council was held on Tuesday evening to consider a proposal to apply to the Local Government Board for sanction to borrow 14,000*l.* to defray the cost of the erection of public baths at the corner of Northumberland Road and Cooke Street. Mr. E. Talbot, chairman of the baths committee, in proposing the resolution, said the site which it was proposed to purchase covered some 4,000 square yards, on which it was intended to erect a building containing two plunge baths, one for men 75 feet by 31 feet, and another for women 60 feet by 26 feet. There would be in addition thirteen slipper baths for men and six for women, and a vapour bath in each department. The site of the new baths was nearly a mile from the Leaf Street baths and over a mile from the other bath controlled by the Council. There was a large number of day schools in the vicinity of the site, whilst the population of the Clifford, Trafford and Cornbrook wards, which it was intended to serve, was about 20,000. The chairman (Mr F. W. Bates) observed that the plans of Mr. Ernest Woodhouse, which the committee had selected, were such as would commend themselves to all, and he was sure the new baths would prove a source of usefulness and would be an ornament to the district. They had spent much money, especially on the new technical school, which he was glad to say was proving such a success, and he was sure their latest venture was an equally wise one. The resolution to apply for borrowing powers was carried without dissent.

NEW Board schools in Hatherley Road, Gloucester, were opened on the 17th inst. They were designed by Mr. Alfred J. Dunn, A.R.I.B.A., who has provided the following accommodation for 992 children at a cost of 11,548*l.* 10*s.*—Central hall for boys and girls with contiguous classrooms, central hall for infants with contiguous classroom, complete control of each department by the head teacher, one playground for boys and a separate playground for the girls and infants, direct access from each central hall to playground, direct access from each classroom to playground, direct access from each classroom to central hall. These points were of the utmost importance, as they prevented classes being disturbed by the assembling or dismissing of other classes. The buildings are warmed by hot water on the low-pressure system by means of pipes and radiators proportioned to the size of the various rooms. The radiators are connected with flues to the open air outside, so that fresh warmed air can be admitted and controlled by valves as required. The important question of ventilation received the most careful attention, the fresh air being admitted

as above mentioned, in addition to which the lower parts of all the windows were made to open. The foul air is carried away as it accumulates by means of air-shafts in the ceiling connected with automatic air-pump ventilators. The upper portion of all the windows are provided with swing casements to still further facilitate the ventilation in summer weather. A notable feature is the electric-bell installation, which provides communication between each central hall and the various classrooms, and from each central hall to the caretaker's house. The external elevations throughout are of red brick in white mortar, with terra-cotta dressings supplied by Messrs. Gibbs & Canning, the roofs being covered with best brindle-coloured tiles, while the internal walls have dadoes of salt-glazed bricks. The floors of the central halls and classrooms are of wood blocks on concrete beds. The floors of corridors, cloakrooms and lavatories are of concrete finished on the face with granolithic. The internal joiners' work is stained and varnished.

BUILDING AND BUILDERS.

THE foundation-stones were laid on Saturday last of a new mission hall which is being erected in Baker Street, Wolverhampton, by the Protestant Association.

A NEW hall which has just been erected in connection with St. Stephen's U. F. church, Paradise Place, Perth, was formally opened on Sunday. It has cost between 1,800*l.* and 2,000*l.*, is capable of holding about 400 adults, and is intended for use in connection with the Sabbath school and other such meetings.

MEMORIAL-STONES for the Lawson Temperance Hall which is being built at Lincoln, at a total cost of about 6,500*l.*, were laid on Wednesday in the presence of a large assembly. The building will be of red brick with stone dressings, and the front will be embellished with four oriel windows. A large hall is to be provided capable of seating 1,000 persons, a lecture hall; a workmen's café, reading and recreation-rooms, lodge-rooms, &c.

FOUNDATION-STONES of a new Primitive Methodist Sunday school have been laid at West Lane, Keighley. The school, which takes the place of a wooden structure, occupies a site adjoining the chapel, and is to accommodate 400 scholars. There is a large assembly room, with gallery, eleven classrooms, infants'-room and lecture-room on the ground floor, and

two classrooms above. The cost of the building and furnishing is estimated at 2,500*l*.

SOME electric-light workmen engaged on operations at the Solicitors' Department of the Treasury, Whitehall, have made a discovery. Upon taking up a corridor floor they found underneath a long deep unknown passage. Explorations of this secret chamber have not been completed, but among the documents unearthed is a petition to George III. from several officers of the Army and Navy, praying that they might be released from the debtors' prison in order to fight against Napoleon. It is dated 1803.

THE report of the cleansing sub-committee of the Town Council of Aberdeen, who recently visited a number of towns where refuse-destructors were in operation, has been issued. They recommend the erection of a destructor plant in the first place capable of destroying not less than 160 tons a day near the Upper Justice Mills, a second to be afterwards installed in the northern district. The value of the residuum in the shape of clinkers capable of being utilised for concrete-making and the like is estimated at upwards of 375*l*. per annum.

THE Local Government Board have written to Halifax Town Council on the question of the refuse destructor proposed to be erected by the Corporation in the valley near North Dean railway station. Objection had been raised to it by the Board of Guardians, who have provided a new workhouse hospital on the tableland above, and also by owners of residential property in the district, on the ground that the fumes from the chimney would create a nuisance. The Local Government Board state that the destructor will only be sanctioned on condition that the chimney is built 300 feet high.

AT the meeting of the Walsall Town Council a recommendation was received from the special committee that the tender of Messrs. Armitage & Hodgson, of Leeds, to erect the new municipal buildings for the borough for the sum of 67,650*l*. be accepted. The new buildings, which have been designed by Mr. James S. Gibson, are to include council chamber, committee-rooms, &c., offices for all the Corporation officials, and a town hall to accommodate about 1,700 people. The site is in Lichfield Street, and includes the land upon which the Liberal Club at present stands.

IN view of the Brighton Corporation taking over the Aquarium by purchase at the end of next month, the Town Council have discussed a report as to adapting the institution to the purposes to which it is to be applied. The works

advised as imperatively necessary at this preliminary stage were the reconstruction of the concert-room and of the fernery and waterfall, installing the electric light, improving the tanks and various structural repairs. A sum of 25,000*l*. will be required, which will include provision for an aviary. The proposals are to be further considered at another meeting.

THE building scheme in connection with the parish of St. Margaret's, Leeds, is from its novelty attracting some notice. The vicar-designate (the Rev. A. Hastings Kelk) has intimated that the foundations for the new wing to the schoolroom are now ready. These have been prepared by voluntary workers, not a single sixpence being expended in labour, and to-day the bricklayers, also unpaid, are to begin work. The plans, bricks and a four-light leaded window were all given free, and now quite an army of workmen of different trades and members of the congregation are engaged in erecting the school wing.

THE tender submitted by Messrs. W. Johnson & Co., Wandsworth, has been accepted for the Baptist Church, Lewin Road, Streatham, S.E., and the work is to proceed at once. Accepted amount, 3,033*l*. A bold square tower and spire above forms a prominent feature of the design and front elevation. The building is faced with red bricks, and the dressings are of white Costessey work. The roof is to be covered with green slates. The architects, whose designs were selected in a competition held some years ago, are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, W.C.

THE foundation-stone of the new Episcopal church for Lockerbie, N.B., was laid on Saturday. The new church is situated in Ashgrove Terrace and is of Early English architecture. The estimated cost is about 1,600*l*., and there will be accommodation for seating 150. In addition to the organ-chamber there will be a capacious vestry and heating chamber with all the other necessary conveniences. The stone used is from Corncockle Quarry, and the roofs are to be covered with red tiles, while the floor of the nave will be of wood blocks and the chancel flagged. The chancel is designed with an apsidal end, and the altar is to be elevated above the nave floor. The height of the spire from the level to the top will be 40 feet.

WITH the progress of the Manchester Corporation system of electric tramways and the construction of additional cars, new sheds for storing the latter have become a necessity. The cars which are running over the present routes are stored in the Queen's Road depôt, but several sheds will be necessary when the 430 cars which are now on order, and of which 200 are said

to be ready for delivery, are completed. It has been practically decided by the tramways committee to erect the second of these sheds in Hyde Road, on land now covered by a large timber yard. With regard to other sites, it is not expected that anything will be done until the arbitration proceedings between the Corporation and the Carriage Company have been completed.

THE foundation-stone of a new asylum to be erected for the Aberdeen District Lunacy Board at Kingseat, Newmachar, was laid on the 14th inst. It will be built on the plan of the Alt-Scherbitz lunatic home in Saxony, and will be the first segregated asylum in Scotland. The grounds cover an area of between 30 and 40 acres, and will cost about 70,000*l.* The intention is to break down the institutional character of the asylum, and, as in the case of the Prussian village, no walls or railings will mark off the ground, and there will be no separation of the asylum grounds from the surrounding country. As little restraint as possible will be put on the patients, who will be expected to look upon the "colony" as a home more than as a place of detention. The ceremony on Saturday was attended by a large and representative company, including Lord Provost Fleming and other civic dignitaries.

THE work at St. Stephen's Church, Avenue Road, Regent's Park, is drawing to a close. The chancel is rich in colour and gold. On the upper part of the east wall are painted angels with censers, in adoration of the Agnus Dei. On each side of the window, under elaborate canopies with mosaic backgrounds, are the figures of St. Stephen and St. Andrew. The reredos, yet to be finished, will be in gold ornament, and the four evangelists on gold gesso backgrounds. The side walls are diapered with arcading, emblems of the Passion in gold, and a rich dado in reds, green, vellum and gold. The nave walls are diapered, with borders to the wall-plate and window headings. The spandrels are filled with ornament in salmon, green, vellum and red, with various devices in white on red shields. Round the nave walls a text is introduced. The work has been designed and carried out by H. G. Bartlett & Co., Brixton.

THE Lowestoft Town Council has under consideration a loan of 35,853*l.* for sea-defence works, and the Local Government Board requires that under the circumstances this loan shall be repayable within a term of thirteen years. This will involve an addition of 8*d.* in the pound to the general district rate of Lowestoft, which has already risen from 3*s.* 8*d.* in the pound per annum in 1891 to 4*s.* 10*d.* in the pound per annum

in 1901. The general district rate in 1902 may accordingly be carried to 5*s.* 6*d.* in the pound per annum, to which, of course, the poor rate would also have to be added. The sea difficulty is believed to have arisen from a shifting of the sands, which have hitherto served as a virtual protection to the town. The Council has been endeavouring to obtain from the Local Government Board an extension of the term during which the sea-defence loan must be repaid, but the Local Government Board has refused to grant the extension. Mr. Douglas, C.E., the engineer consulted by the Council, has accordingly been requested to attend a special Council meeting for the purpose of suggesting a modified scheme for the protection of the beaches, both north and south.

ELECTRIC NOTES.

THE Marquis of Abergavenny, lord-lieutenant of Sussex, on Saturday formally inaugurated the system of electric lighting at Worthing, which has been carried out by the Corporation at a cost of 32,000*l.*

THE inauguration of a new installation for the electric lighting of Longton took place on Wednesday last. The site of the electricity works is included in the area of the gasworks, and the cost of putting down the plant, &c., has amounted to about 21,000*l.*

AT a meeting of the Kilmarnock Town Council it was resolved by twelve votes to ten not to accept the offers, amounting to 29,000*l.*, recommended by the committee for the proposed electric lighting. The effect of this decision will be to delay the scheme indefinitely.

AT the town hall, Darlington, Mr. W. O. E. Meade-King held an inquiry on the 18th inst. into the application of the Darlington Corporation for powers from the Local Government Board to borrow 12,250*l.* for electric-lighting purposes and 14,000*l.* for gasworks. Mr. H. G. Steavenson stated that the Corporation already were providing power for 8,400 lamps of 8 candle-power to 106 consumers, and by the end of the year they estimated that power would be required for 18,000 lamps. The liabilities incurred were 3,593*l.* 2*s.* 2*d.* in excess of the powers.

SHORTLY after nine o'clock on Sunday night one of the electric arc-lamps in Church Street, St. Helens, fell with a

A. GILBERT WOOD & CO. Ltd, 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

crash, alarming several people who were in the immediate vicinity. The street was momentarily illuminated by a brilliant flash, and then the five arc-lamps on the circuit went out as, for other reasons, they had done on previous occasions. The cause of the mischief was that one or two of the guard wires had come into contact with the trolley wires, the result being that the current was turned on to the pole, which broke at the top. Nobody was hurt. Curiously enough, an arc-lamp fell from the same pole through a tramway wire accident a few months ago.

THE town of Boyle, co. Roscommon, was on Saturday night illuminated for the first time with electric light, and the experiment was a complete success. There are about half a dozen arc lamps in the principal thoroughfares, and numerous incandescent installations light up all the side streets and surrounding roadways. The introduction of the electric light here is due to the enterprise of a local miller, Mr. Hugh Stewart, with whom the Town Commissioners have entered into a contract for three years for the public lighting of the town at the rate of 80% per year. The water power of the Boyle river, which runs close by Mr. Stewart's mills near the bridge, is utilised to generate the electricity, and the light, it is expected, will be generally used by the townspeople.

AN inquiry with reference to an application on the part of the Middlesbrough Corporation for sanction to borrow 34,100*l.* for electric-lighting purposes, the loan to extend over a period of thirty years, took place at the Middlesbrough Municipal Buildings on Tuesday. The inquiry was held by Mr. W. O. E. Meade-King, Local Government Board inspector, and there were present Mr. Alf. Sockett (deputy town clerk), Mr. Parnaby (borough accountant) and Mr. R. Hammond, representing the Corporation. Mr. Sockett explained that an order had previously been agreed to for the borrowing of 36,000*l.* over a period of twenty-five years, and the present application was for sanction to borrow 34,100*l.* for a period of thirty years, 13,100*l.* being expenditure in excess of the amount previously sanctioned and 21,000*l.* the cost of providing additional plant for the extension of the mains. The inspector asked if the present site was big enough and if any land had been purchased, and Mr. Sockett replied that the site was large enough and that no land had been purchased. There was no opposition to the application.

OWING to the vast and increasing demand for electric current for lighting and power in Manchester, some little

uneasiness has been felt with regard to the supply for the approaching winter. The only generating station at present in use is that in Dickinson Street, which has been working at full pressure for some considerable time. The new works in Bloom Street, which when completed will produce electricity equal to 14,000 horse-power, are still far from finished. It is only within the last few weeks that the authorities themselves have felt free from anxiety as to the rate of progress at this station. It is now stated, however, that the boiler-house, which with the chimney-flues is the most pressing work at present, will soon be completed. It is therefore hoped that by the end of October the Bloom Street works will contribute as a first instalment an additional horse-power of 3,500, which will considerably relieve the Dickinson Street plant, and enable an adequate supply of power to be maintained throughout the winter. The work at Stuart Street is also being pushed forward. The voltage of the current contributed from the works at Dickinson Street only amounts to 400, but when the new works in Stuart Street are completed the sub-stations will be fed with a current of 5,000 volts, generated by six three-phase alternators. The total output of these works is estimated at 15,000 horse-power.

GREAT progress has been made in the development of electricity in Bradford since the Corporation took in hand the task of supplying the current. From the first there has been a constant and ever-increasing demand, and the electricity committee has no sooner got one extension out of hand than they have had to prepare for another. The foundation-stones of another new generating station in Valley Road have now been laid. In his remarks on the occasion of the laying the chairman quoted figures to demonstrate the progress that had been made. He said that in 1889 the capital expenditure stood at 18,456*l.*, whereas in 1900 the capital expended was 280,469*l.* Since he had been chairman of the committee, about two years, they had obtained borrowing powers for 210,000*l.* In 1889 the committee supplied 22,449 units, and last year the number supplied was 3,424,658 units; whilst the number of consumers in the same period had risen from 43 to 1,277, and the number of lamps had increased from 4,889 to 172,041. This showed the necessity for carrying out the extensions, and proved how rapid had been the increase. Electricity was superseding every other form of motive power in Bradford, and it was being used by every trade. Such, indeed, was the demand that the committee scarcely knew how to meet it. He trusted that the present rate of progress would

be continued, and that the future would demonstrate the necessity of the building now founded. The portion of the new building that is being built at present will be capable of accommodating three engines having a total horse-power of 1,000; two of these are now on order with Messrs. Cole, Marchant & Morley, Ltd., of Bradford, and are practically finished. The electric generators, each having a capacity of 1,000 kilowatts, have been built by the British Westinghouse Electric and Manufacturing Co., Ltd., and have already been delivered.

MR. M. K. NORTH, A.M.I.C.E., Local Government Board Inspector, held an inquiry on Friday last at the Warrington town hall with regard to the application of the Corporation for powers to borrow 15,000*l.* for electric-lighting purposes. Mr. Lyon Whittle (town clerk) represented the Corporation, and here were also present Major Cardew (consulting electrical engineer), Mr. Grimsdale (electrical engineer), Mr. T. Longden (borough surveyor), Mr. J. Fairhurst (hon. treasurer), Mr. S. Wilson (deputy town clerk), Mr. C. Madeley (librarian), Ald. Shaw Green and Mr. A. Boyle. In reply to the inspector, the town clerk said the population of the borough at the last census was 64,242, the assessable value 212,853*l.* and the balance of outstanding loans under sanitary acts was 208,434*l.* The Corporation wished as long a period as possible for repayment. No opposition being offered, the town clerk explained that the application was made under the Warrington Electric-Lighting Act of 1898. Powers had already been sanctioned to borrow 4,966*l.* and this had been spent on the erection of an electric station, plant, the supply and laying of mains for the whole of the compulsory area, and, in addition, they had ninety-two customers and public lighting of streets. The application for 15,000*l.* was to meet the growing demands of the town. Mr. Grimsdale proceeded to give details of the additional work required. He said that in January last there were 546 eight candle-power lamps in the town, and now there were 10,910. In February next, when the tramways would commence working, there would be a largely increased demand, and there was also every prospect of an increase in lighting. The Borough Treasurer said that the actual amount of money spent on the last loan was 40,668*l.*, but there was really a liability of 4,418*l.* over the loan for which no money had been borrowed. So far as he could see at present, there was every prospect that the electric lighting would be a success, but of course the works had not been opened twelve months yet. Major Cardew observed that it was the best policy for a corporation to have

an adequate supply beforehand. Should they not be able to give a good supply dissatisfaction was caused, and it was then some time before confidence was restored. The inquiry then terminated.

A USEFUL HAT-RACK.

THERE are few among our readers, we think, who have not at some time or other had to deplore the damage sustained by their headgear at church, theatre, or public meeting, owing to the lack of accommodation for the cumbersome, if necessary adjunct to the toilet, whether it assume the bowler or the cylinder form.

With a view to meeting this universally-admitted and long-felt want, Mr. Grice, of 21 High Street, Leicester, has devised a neat and ingenious contrivance which can be conveniently fitted under the seat well out of everybody's way, and will safely hold and securely guard the hat from all chance of damage or injury. Its inventor claims that it is simple, effective and unique. Simple and effective it assuredly is, and it has, moreover, the advantage of being inexpensive.

ALL-ROUND excellence characterises the numerous turns which make up the attractive programme provided for his patrons by the indefatigable Mr. C. Dundas Slater, at the Alhambra Theatre. In addition to the bright and bustling ballet, "The Gay City," and the more elegant and poetical one, "Inspiration," of the exceptional beauty of which we have already written, Hood's sensational cycling exhibition of racing on a track which is constructed at an elevation of about 60 degs. may certainly be regarded as one of the *pièces de résistance*. The riding exhibited in this turn by Messrs. Fred Staig, A. Wood, Henry Irving, Bert Burgess and William Watson is of a most sensational description, and meets with a deservedly appreciative reception. Misses Cooke and Clinton go through a smart performance with a neatness and precision which do much to justify their claim to the title of "champion sharpshooters." The droll parodies of Schwarz Bros., eccentric cycling by Charles and Frederick, amusing tricks by Miss Ada's admirably trained troupe of fox terriers, and five or six other capital turns, of which the *finale* is the Imperial Bioscope views of recent events, make up a brilliant programme, to the brightness of which the admirable orchestra, under the skilful leadership of Mr. G. W. Bing, contributes in no small degree.

NEW TECHNICAL SCHOOL AND MUSEUM EXTENSIONS, LIVERPOOL.

THE architecture of Liverpool has been notably enriched by the new building which has just been erected in William Brown and Byrom Streets, and which is in part to be used as an extension of the museum and for the rest as a technical school.

The new building, which forms part of the group which includes the Walker Art Gallery, the Rotunda reading-room and lecture hall, the Brown library and museum and the county sessions house, is in what is described as nineteenth-century Classic style, and is from designs by Mr. E. W. Mountford, who gained the award in open competition. It is built in Stancliffe stone from the quarry which supplied the stone for the Walker Gallery.

The principal frontage, which is in Byrom Street, is originally and effectively accommodated to the exigencies of the site by a bold curve, in the centre of which is situated the main entrance, approached by two flights of steps leading to a broad and ample landing. The steps are flanked by a circular balustrade, terminating on either side in large pedestal piers, upon which will be erected large bronze lamps, to be fitted with the electric light. From either side of the entrance rise heavy columns supporting a pediment bearing finely modelled statues of heroic size from the studio of Mr. Pomeroy, who has executed the whole of the sculpture which adorns the building. The figures over the entrance-hall represent Art holding the mirror up to Nature and holding the famed anatomical study by Michel Angelo, and Science veiled and with a crucible. Immediately above the main entrance pediment, and extending along the whole front, rise sixteen Ionic columns with carved capitals and volutes, and these support a richly decorated cornice, which is surmounted by the balustrade above. The large columns, over 30 feet high, harmonise with those of the other buildings in William Brown Street, and they are practically upon the same level. This seems curious in view of their height above the street level, but so great is the fall of the roadway between the entrance to the present museum on the plateau and Byrom Street that the bases of these columns are actually 2 feet above the columns on the plateau. While the curved frontage in Byrom Street presents a handsome appearance, much can be said for the William Brown Street

elevation, where the fine sculpture of Mr. Pomeroy is conspicuous. The features of this frontage are the bold projecting bays, with their deep vaulted arches enriched with simple decoration and surmounted in the pediments by finely modelled groups of statuary. The character of the Byrom Street front is reproduced in the marking of the divisions of the building, the lower portion coinciding in design, while from the museum level there rise bold square pilasters supporting the main cornice and pediments.

In the groups of figures occupying the pediments Mr. Pomeroy has sought to represent by allegory the prevailing spirit of the city. Minerva, as representing the wisdom of the city, with shield and spear protects and presides over the education of the community. On one hand is the bearded figure of an old man instructing an eager boy in the mysteries of science, and on the other a young mother is carefully directing the thoughts of her child to some sheep, typifying the agricultural interest. The second pediment contains another dignified group, of which the principal is a majestic seated figure holding a globe and sceptre, representing Liverpool, this being supported on either side by female figures typical of commercial life and industrial occupations. The sculptured figures on the pediments of the arches represent Astronomy, Navigation, Geography and Agriculture.

A feature of the entrance-hall is the fine oak-screen which surrounds the interior doorway, leading to a lofty vestibule, of which a prominent feature is the foundation-stone of polished granite, recording the fact that it was laid by Sir William Forwood on July 1, 1898. The vestibule is surrounded by a dado of oak, and the same material lines the hall, in which fluted oak columns with carved capitals carry the handsome cornice, and from this spring the arches supporting the high-domed ceiling. Black and white marble tiles form the floor, and columns of red-veined Devonshire marble, above which is a superstructure adorned with panels illustrating the rise of shipbuilding, and the handsome marble fireplace, which forms a feature of the hall, is surmounted by a representation in relief of the city crest.

Broad corridors branching right and left of the entrance hall give access to the various rooms, while two spacious and well-lighted staircases in the side passages establish ready communication between the different floors. The corridors, staircases and all the classrooms and workshops throughout the building are extremely well lighted, of cheerful appearance, and well adapted for the purposes for which they are intended. The light for the internal elevations is obtained from a very

large courtyard on the east side of the building and two smaller ones in the centre, which are all faced with white glazed bricks. The ground-floor corridor on the entrance side, which is lined with bird's-eye marble from Derbyshire, has a semicircular vaulted and panelled ceiling, and the deep windows are filled with leaded lights of elegant design, containing shields with scrolls recording the names of the chairmen of the building and technical instruction committees. Immediately opposite the entrance are the swing doors of the large lecture-hall, a well-proportioned chamber of a quiet, restful tone and simple but pleasing design.

The floor of this apartment is of polished oak, and the walls are lined with a high dado of light canary-wood in its natural colour. From this dado springs the bold outline of the ribs supporting the vaulted ceiling, in which are placed large circular windows. At the north end is a raised platform, above which appears an elaborate panel representing a group of students receiving awards from the hands of the presiding genius of education. An adjacent corridor gives access to the committee-room. This is lined with a panelled dado painted a dead or "flatted" white, and fluted columns with carved Ionic capitals support the panelled ceiling with its large encircling wreath of modelled fruit. The floor is of polished oak, and the mantelpiece is formed of Irish green marble and red-veined alabaster. There is a niche in the mantelpiece in which a bronze bust of the late Queen Victoria will be placed.

The aim throughout has been, so far as was compatible with cost and the limits of decoration in a building devoted to classrooms, workshops and the like, to use work not only of good design, but such as would appeal to the students as meritorious specimens of handicraft and technical ability.

The museum occupies the upper portion of the building, and entrance to it is only gained from the existing museum premises, which are upon the same level. The addition consists of two U-shaped galleries, running without interruption the entire circuit of the building. The lower gallery, of over 400 feet in length and 34 feet wide, has a flat ceiling, and is lighted by large windows in the inner and outer walls. Lined all in white plaster, it is a bright airy and spacious apartment, but in this respect is surpassed by the upper gallery, which is a magnificent room, noble in proportion and brilliantly lighted. Bold, semicircular arched ribs, finely moulded, spring from the side piers to support a roof, which is a long dome with skylights running the entire length of the gallery, which is remarkable for the bright and cheerful aspect.

TRANSPORT OF TIMBER.

A PAPER was read before the Botanical Section of the British Association by Mr. Samuel Margerison, on "The Transport of British Timber." He said that in this country it cost about 5d. to grow a cubic foot of fir timber. On the average it cost about another 5d. or 6d. to get it into the market, and it sold for 8d. to 9d. per cubic foot. The chief reason why it sold for less than cost price was that foreign fir was sold at the figure specified, and the growers and importers could make it pay. He had selected fir as an extreme case in order to emphasise the fact that the handling charges on home-grown timber were much higher than those on imported timber of the same species. We could grow Scots fir and spruce practically as cheaply as the continental forester, but we could not afford to sell it at the same price and at the same time compete on equal terms with him, because it cost us more to transport it from the plantation to the consumer, sometimes even when both were in the same county; and until we could do it as cheaply the splendid efforts of our scientific botanists to produce good and cheap timber were greatly spoiled by the hard facts of £ s. d. This, it might be said, was an old story about all native produce. Yes, but because of its bulky nature it was more ruinous in relation to native timber than, say, to home-grown corn, because of its greater handling charges in proportion to its value. A ton of wheat was sold for, say, 6l. 15s. Of this 5 per cent. (6s. or 7s.) would be paid for cartage and railway carriage. But a ton of spruce sold for 33s. would cost 21s. (or 60 per cent.) for cartage and carriage. A ton of spruce grown in a Baltic country cost in transport from the forest there to the consumer here about 40 per cent. of its selling value, and a ton of spruce grown in Canada very little more. Of course the discrepancy and extra cost did not seem so great proportionately on the value of the higher priced timbers. But these took longer to grow, and except in favourable surroundings the final results were about the same. There was little commercial encouragement to produce timber if there was no reward but that which virtue was said to bring. Preferential railway rates in this country were costing timber growers nearly as much as the rental value of the land on which the timber was growing. Why was there this great check upon the efforts to make forestry pay? One reason was that foreign timber imports were handled generally in larger quantities, so that detail work was done more cheaply.

THE MAY-OATWAY FIRE ALARM

Simple, Inexpensive, and Reliable.

Licensed by H.M. Postmaster-General.

Country residences some distance from fire brigades when catch usually burn themselves out. This is preventable. Pumps and extinguishers are sometimes cut off in the fire is discovered. The May-Oatway Fire Alarm discovers in time to prevent loss or fatal consequences. Detects the fire, calls the nearest Fire Brigade, as well summons lodgekeepers, stablemen and all helpers, and sets out the exact seat, extent and course of the fire automatically, without human assistance, and whether the building is occupied or not. Architects and builders invited to inspect.

Subscribed Capital, £2,127,500.

But it was not only in railway charges that our expenses were higher. The overland carriage cost us more. We had not the advantage of water shoots and great rivers, or sufficient snows and frosts to make water or ice a generally available means of transport. Could these overland forest to railway handling charges be reduced? He had made some inquiry about tramway and other mechanical appliances, but did not see any advantage to be gained from them under the conditions ruling in this country. The chief drawback to their use was that our small and scattered plantations would not pay for the profitable employment of costly plant and machinery for transport. A tramway, cheap as it was in working, was costly in instalment, and although it would effect considerable reduction in the cost of transporting a large lot of timber grown in a suitable environment, and could be used again under similar circumstances, would, in a large number of cases, be much dearer than the present system of removal by horse waggons. Besides, public roads would have to be used and crossed, and county councils would not be ready to allow this. Under favourable circumstances, again, traction engines would effect considerable economy in haulage. A load of 12 or 15 tons might, on some roads, be carried for less than one of three or four tons drawn by horses. But good roads did not often penetrate into the woods, and there were weak bridges and sharp corners to contend with, which would not be negotiable with long, heavy loads such as would be required to use the full available power. The pole-waggon at present in use, drawn by horses, was the best appliance at present in existence for collecting timber from our comparatively small timber areas in the first instance. But if we could have partial conversion of the timber at centres close to large areas of timber, we could considerably cheapen the cost of transport, both by using traction engines and tramway for the local work and traction engines for "through" traffic to reasonable distances. It was easy to complain of the iniquities of railway companies in charging more for carrying native produce than foreign, and there was considerable reason for the complaint, especially under the present chaotic system of measurement and the newly-insisted-on wharfage charges. But the question was not a one-sided matter. There was no gainsaying the fact that native timber did, on the whole, cost somewhat more to transport than foreign. It was often in clumsy, dangerous forms, crooked and knotty, whilst imported timber was generally wholly or partly converted into tidy, straight pieces, making more compact and

firmer loads. And being dealt with at ports in larger quantities at one place, much of the work was centralised and specialised, with the result that there was a large saving in details. Railway managers were practical business men, who could not afford to do work on philanthropic principles, and they saw this difference in the nature of the two classes of merchandise. But, at the same time, we had no practical indication that, if any effort was made by our home producers and merchants to centralise their work, make their loads more compact, and arrange for regular and large consignments, the railway companies would make their charges equal those for imported timber. Straight and crooked, large lots and small, compact loads and light ones, all were charged at the same rate. The question was a large one, and its importance was not sufficiently realised by those who were most affected by it, namely, growers of timber. Whilst persevering in the efforts which had been made of late years to improve our forestry, it behoved growers to pay special attention in future to the relation of transport to concentration of production, the producing of timbers of the higher values, compactness of loads, and regularity of supply of consignments.

NOTTINGHAM'S ELECTRIC TRAMWAYS.

OWING to the rapidly extending suburbs of Nottingham, a system of electric trams has been found necessary, and to house these premises of unusual extent are now being erected upon a site which was formerly used, in part, as the playing-piece of the Forest Football Club. Here provision has been made for an exceedingly commodious shed to accommodate about 80 cars, with repair and fitting, carpenters, blacksmiths' and paint shops in convenient proximity, together with buildings to be used as stores, carriage-house, cart-shed, mess and recreation-rooms and a foreman's cottage. The buildings as a whole occupy an area of about 7,500 square yards, while the car-shed alone is sufficiently large to accommodate conveniently no fewer than eleven parallel lines of rails. The work of erection was only commenced towards the end of May, and to avoid the possible inroads of floods a vast amount of underground work, in the shape of filling up and constructing unusually stout foundations, had to be accomplished ere the superstructure could be undertaken, but already, so great has been the progress that the contractors have made, the buildings are practically ready

or roofing. They have frontages to Bunbury, Turney and Pyatt streets, the latter two of the new thoroughfares branching out from Arkwright Street, and the main entrance is set back from Bunbury Street some 35 feet, a sufficient distance to allow of ease of access and egress for the cars. The latter can be run to and from the main lines in Arkwright Street, either along Turney or Pyatt streets, and the provision of an alternative route thus secures simplicity of working. The frontage to Pyatt Street is about 500 feet, and to Turney Street about 95 feet. The car shed is 266 feet long by 130 feet wide, and to have a three-span roof of glass carried on wrought lattice steel stanchions and girders. Externally it is built of red brick with a blue brick plinth, and faced with heavy stone dressings throughout, while internally the walls are faced with Leeds glazed bricks and white bricks from the Leicestershire district. The cars will be run in over pits extending the whole length of the shed, to facilitate the work of inspection and minor repairs, but the plans also include two sets of rails leading into the repair and fitting shop, and two each into the carpenters and painters' shops. A traverser is to be erected between the car shed and the adjoining shops for the purpose of transferring the cars from one portion of the buildings to the other. Facing Bunbury Street there is a mess-room on the Pyatt Street side, and a suite of offices at the other corner. The repair and fitting shop is 20 feet long by 63 feet wide, and this also will be provided with a crane. Immediately adjoining are the carpenters' shop, 65 feet long by 32 feet wide, and a paint shop of similar dimensions, whilst the apartment set apart for the use of the blacksmiths has a length of 44 feet and a width of 25 feet. By the side of the latter building a commodious sand-drying shed is being erected. At the rear of the principal structures are located the stores, with a mess-room and recreation-room above, carriage-house, cart-shed, stabling and loose box, and above the latter there will be a billiard-room and other conveniences for the use of the employes. The remaining buildings comprise a substantial foreman's cottage and an oil store, and the whole of the erections at the western extremity, facing the Lundella Schools, enclose a large yard. Some idea of the satisfactory nature of the progress which has been made by the contractors, Messrs. J. H. Williamson & Co., may be gleaned from the intimation that, under a clause in the contract the firm are earning a bonus by reason of the fact that a portion of the superstructure was completed considerably before the stipulated time. At one period there were no fewer than 220

men on the work, and in one week upwards of 260,000 bricks were laid. Architectural elaboration has been carefully avoided, but, within the limits prescribed by prudence and economy, premises are being constructed which will be imposing in their appearance and commodious in their accommodation, and will secure the utmost convenience and facility in working. The plans have been prepared under the supervision of the city engineer, Mr. Arthur Brown, M.Inst.C.E. Mr. Walters is acting as clerk of the works, and Mr. E. Wilson discharges the duties of foreman-in-charge on behalf of the builders.

MANCHESTER WATER-SUPPLY.

IT has been decided to place still more stringent limitations upon the water-supply in Manchester. This is simply the natural result of the prolonged drought and the rapid reduction of the stock in the reservoirs. On the 18th inst. there were only 972 million gallons available, and this is no more than about 24 days' supply, calculating on the basis of an average daily consumption of 35,000,000 gallons. No rain fell at Longden- dale on the Thursday, and the springs yielded about 10 million gallons. The responsibility of further curtailing the supply, if it became necessary, was left by the waterworks committee at their last meeting in the hands of the chairman, Alderman Sir John Harwood, and the deputy-chairman, Sir Bosdin Leach, and the following notice was issued to the public last week in the name of the committee:—"Notice is hereby given that in consequence of the prolonged drought the Corporation are reluctantly compelled to place further restrictions on the supply of water, and that from and after Sunday next, the 22nd inst., the supply will be shut off between the hours of six o'clock at night and six o'clock in the morning until further notice.—By order, WM. HENRY TALBOT, Town Clerk."

Sir John Harwood has stated in reference to the notice that it is only with great reluctance that the committee have been compelled to limit the supply still further. It was impossible to say how long the new restriction would last. Even if there were a heavy rainfall it would be imprudent to take advantage of it at once. A good deal of the water would be flood-water, and would have to pass through the settling tanks before it could be used. The Chairman again appealed to the public to use as little water as possible until better times.

ELECTRIC LIGHTING AT SHREWSBURY.

ON Friday morning Mr. H. Boulnois attended at the Guild Hall, Shrewsbury, to hold an inquiry with regard to an application made by the Town Council to the Local Government Board for sanction to borrow 16,526*l.* for extending the electric lighting in the borough. There were present the mayor (Mr. R. S. Hughes), Mr. T. P. Deakin (chairman of the lighting committee), Mr. H. C. Clarke (town clerk), Mr. V. C. L. Crump (financial clerk), Mr. J. Williams (borough committee clerk), Mr. W. C. Eddowes (borough surveyor) and Mr. C. M. Johnston (electrical engineer). The town clerk said the area of the borough was 3,470 acres. The population at the end of 1890 was 26,967, but at the last census it had increased to 28,395. The annual assessable value was 142,638*l.* The outstanding loans under the Public Health Act amounted to 125,158*l.*, while the amount outstanding on the electrical account was 35,900*l.* In October 1898 the Corporation applied for sanction to borrow 30,463*l.*, to enable them to purchase the Shropshire Electric Light and Power Company's undertaking. The Local Government Board sanctioned the borrowing of the sum with the exception of 3,011*l.*, which they withheld pending further inquiries. The purchase of the undertaking was afterwards completed, and the Corporation entered into possession on January 1, 1899. As soon as they had acquired the undertaking, the Corporation built a new boiler-house, fixed an economiser, and raised the engine-room roof to permit the fixing of an overhead crane, in order that the machinery could be more easily handled. They had lighted with electricity the Corporation waterworks, the public baths, free library, general market, butchers' market, old market hall, the police station, sewage pumping station, and, latterly, the borough technical school. For this purpose the distributing mains had to be extended in order to supply the current. The mains had also had to be extended to supply private consumers in Bellstone, Frankwell, Abbey Foregate and Kingsland. At the time the Corporation took over the undertaking great complaints had been made about the lighting of the streets—particularly the main streets—and for more efficiently lighting the streets the Town Council caused thirty-eight arc lamps and thirty-two incandescent electric street lamps to be fixed. One of the Council's objects in lighting the streets was because the gas had to be purchased from a company. Last winter they found the electric-lighting works were very heavily loaded, and in consequence thereof it became

necessary to provide more machinery to carry on the current throughout the winter. Notwithstanding that, however, there was practically no spare plant for the ensuing winter. The Council had already entered into contracts for the supply of additional machinery, including cables, and the loan asked for would also include the cost of feeders and of extending the distributing mains in the compulsory area, for the further extension of street lighting and also for probable consumers. The committee were in hopes that the sum they now asked for would carry them over a period of three years. The machinery at the works had been overhauled thoroughly, and partly renewed out of revenue, and he (the town clerk) thought that on his inspection of the works Mr. Boulnois would see that it was in a very good condition. Mr. Johnston then gave a brief history of the undertaking since its acquirement by the Corporation, and submitted plans of the proposed alterations and extensions. The town clerk said he was asked specially to press upon Mr. Boulnois the necessity of the granting of an extension of the period for the repayment of the two former loans, which was fixed at twenty-three years to twenty-five years. He also asked that the repayment of the present loan should extend over a period of twenty-five years from the present time. If the Local Government Board could not see their way to do so, he asked that the period of the repayment of the present loan should be thirty years. He thought he was not asking anything unreasonable in this, because their machinery was as good as new. Mr. T. P. Deakin said he noticed from a paper which was an authority on financial matters connected with electric-light undertakings that their sinking fund was very much heavier than the general run. In Burnley, with a capital of 51,000*l.*, they had to pay to the sinking fund 99*l.* In Burton, with a capital of 40,474*l.*, the sinking fund was 99*l.* He noticed that with capitals a great deal more than double theirs the sinking fund was considerably less. Mr. Boulnois said the Board generally granted periods of twenty-five years after the installation had been started, but as he did not hold the first inquiry in Shrewsbury he could not say why they only allowed them twenty-three years in which to repay the money. However, he would lay all the facts before the Local Government Board. Mr. Deakin, on behalf of the Mayor, who had been called away, thanked Mr. Boulnois for his courtesy during the inquiry. Mr. Boulnois said he was much obliged to Mr. Deakin and to the officials for the manner in which they had laid the matter before him, and the inquiry closed.

The Architect.

THE WEEK.

NOT many years have elapsed since Dr. HELBIG, the German archæologist, publicly expressed his doubts about the genuineness of several of the objects found in the Etruscan Museum which had been set up in the villa of Pope Julius, in the suburbs of Rome. The Italian Government became alarmed, for a party question might be made out of the subject; and, in consequence, the Press that could be regarded as directly or indirectly official, was up in arms against Dr. HELBIG and his theories. If judgment could be determined by the quantity of printed matter, there is no doubt it would be in favour of the Italian Minister of Instruction, and the Ministerial position was saved. But archæology had also some claim. There has been a reaction on non-political grounds, and the statesman who now controls public instruction has misgivings about the infallibility of his predecessor. It is expected that when the next Historical Congress is held at Rome in the spring of 1902 it will be found that the collections in the Etruscan Museum have undergone rearrangement and renaming. Several of the purchases may also be eliminated. This should be a satisfactory lesson in other cities as well as in Rome. Experts are often deceived when they purchase antique objects with a view to profit, and it cannot be expected that the officers of museums are less liable to be deceived. Dealers bear their losses quietly, for it would not serve their interests to reveal that they had no immunity against errors of judgment, but in all countries officials will never acknowledge their errors, and they make pretence that the attacks against them are inspired by selfish motives.

In the last part of the Proceedings of the Deutschen Orient-Gesellschaft Dr. KOLDEWEG announces the latest discovery in the excavations on the site of the palace of NEBUCHADNEZZAR. In the southern part the foundations of a great court were revealed, the south side of which must have been especially rich in architectural decoration. The enamel tiles were adorned with flowers and other plant forms. Some stones which were evidently used as roof-covering were ornamented in a way that recalls cloisonné enamelling. But instead of metal the outlines were formed of glass, and the enamel was then placed within the partitions. Inscriptions, coins, fragments of tablets of yellow stone were also met with amongst the ruins. Dr. KOLDEWEG has no doubt that eventually he will be able to prepare the most complete plan of a Babylonian palace which has yet appeared. It is believed that the great room of the palace measured about 160 feet by 60 feet. Opposite the entrance is a niche in which it is conjectured the king's throne was placed. Explorations are about to be undertaken in that part of Babylon which is supposed to have corresponded with the city of London. For it was there that in 1894 the Arabs were able to discover the countless documents relating to the great firm of EGIPT & SONS, the details of all their transactions having been carefully recorded on tablets of baked and sun-dried clay, some of which are now in the British Museum.

FRANCE is becoming more official as the years run on. As one of the delights of the official mind is whitewash, it has been decreed that all the sketches in black, or in colour, or in pseudo-relief which adorned the walls of the loges in the Ecole des Beaux-Arts are to be annihilated. The walls are to be replastered, and will, of course, finish in brilliant white. In that way the officials hope to make all the competitors concentrate their thoughts on the work they have to execute. It is expected, no doubt, that after 1901 French art will assume a new character. There is to be as little gaiety as liberty, and the students of the future are to raise the standard of art because there is no temptation to attract their eyes from their easels, drawing-boards or models. It is overlooked that the scribbling revived associations and favoured the production of good work. A student must have felt ambitious when he discovered that among the temporary occupants of his loge were those who

had gained reputation, and he would not have the artist's mind if he did not endeavour to prove himself worthy of his predecessors. But officialism is not liable to feelings of that kind, and therefore it cannot realise they are worth encouraging. Accordingly, the loges of the Ecole des Beaux-Arts are to be as mute as any prison cells. It is a pity, however, that the change cannot be ascribed to somebody else than M. BERNIER, the architect, who, of course, simply followed the instructions he received from his official superiors.

THE last number of *L'Art* is representative of the aims of the conductor, for with the best of wills it is not always possible for M. PAUL LEROI to attain what he seeks. The first illustration is an etching in two colours by M. LALAZE, which will sustain comparison with eighteenth-century work. An original etching by M. KRIEGER is decisive in style, and shows the church of St. Paul in Antwerp, a building which is rich in carvings and paintings, but is almost unknown to English tourists. A lithograph after a picture by METSU suggests the fitness of the process for copies of paintings. Then there are phototype plates, one after MEISSONIER, and several reproductions of pictures and designs by painters and sculptors. M. MOLINIER describes the *Topographia Christiana* by COSMAS INDICOPLEUSTES, of which there are only two copies in existence, one in the Vatican and the other in the Laurentian Library of Florence. It reveals the notions about geography which were accepted as true in the sixth century. The author was a traveller, and he was confident from his own observations that the world was a square, divided into two parts which were separated by high mountains, around which the sun was guided by the hands of angels. He therefore believed that PYTHEAS was telling the truth when he said he had seen the bed where the sun took repose after the labours of the day were over. As a record of the knowledge of learned men the *Topographia* is an important document. M. LHOMME contributes an amusing epistle which is supposed to come from VICTOR HUGO in the Champs-Élysées, where he finds he is not appreciated as he had anticipated. Writers of all countries appear to shun his acquaintance, and even SHAKESPEARE was vexed when HUGO began to read his volume on the English poet. M. PAUL LEROI continues his exhaustive criticism on the Salons of 1901, which are remarkable for their trenchant analysis.

THE Journal of the Royal Society of Antiquaries of Ireland, as usual, contains several interesting papers. The first relates to the Castle of Carrickmines, a few miles from Dublin. Unfortunately the only part of the historic building which has survived forms one of the walls of a pigsty. The castle must have been of importance, for it was intended to defend the Pale or English settlement against invasion by the clans of Wicklow. There are accounts of many attacks upon it. In 1642 the place was occupied by the mountaineers, and the siege of the castle was directed by Sir SIMON HARCOURT, an ancestor, in the female line, of Sir WILLIAM VERNON HARCOURT, M.P., about whose combativeness there can be no question. HARCOURT was mortally wounded, but an entrance into the castle was gained, and hundreds of the inmates were slaughtered. The castle was then blown up and the walls levelled to the ground. In the paper on Inchiquin a swan legend is introduced not unlike that which was utilised by WILLIAM MORRIS in the "Earthly Paradise." From the paper we learn that the Irish chiefs did not erect castles of stone until the thirteenth century. In 1207 an attempt was made without success, but in 1216 one was, it is supposed, constructed at Killaloe. One chief, who died in 1268, claimed to have built a permanent stronghold with earthworks, but it is said that up to the time of his death no stone castle existed in the county of Clare. Of King TURLOUGH a chronicler wrote:—"Like a good man, he prepared for himself six white castles of stone in which to dwell and spend his affluence, thence also to discipline his borders and to ward the marches of his dominion." There are also papers on Sepulchral Stones and Free-Standing Crosses, Prehistoric Remains and descriptions of various ruins. Several excellent illustrations are introduced.

THE HOUSING PROBLEM.

A FEW years ago a Swiss Jesuit, the Rev. A. BAUMGARTNER, visited Glasgow, and spent several days in exploring the wynds and other regions wherein the poor congregate. He was amazed at the facilities offered to Death for passing from family to family. In the account which he published he is careful to discriminate between the different classes of occupiers. The conclusion must be drawn from his descriptions that in a great many cases improvidence, idleness and drink are the main causes of the misery. As the men are generally the guilty parties, it is impossible to resist the conviction that any suffering they endure is well deserved, and that if justice were meted out a still heavier punishment should be awarded. On the other hand, we read of weaklings who from physical causes are unable to improve their condition, and who are never likely, unless philanthropy becomes predominant, to enjoy more suitable accommodation in this world. The Jesuit seemed to think that nothing less than a miracle would establish in the wealthy city of Glasgow sanitary conditions for the poorer classes.

It is satisfactory to find that Glasgow is no longer disposed to treat such evils as insignificant and to cloak them by the aid of the numerous respectable people who live in the city and fill the churches on Sundays. Glasgow is not alone in possessing vast numbers of unhealthy dwellings. England has also to deal with the housing problem, and that not only in its large cities, but even in some of its small villages. There are very few holiday resorts which do not present the spectacle of having houses built in backyards, and even passages are encroached upon without scruple. As the Lord Provost of Glasgow said at the recent conference, "As a matter of fact and experience, the unimpeded action of the law of supply and demand had built up all our 'back lands,' had crowded tenants on one stairhead, and, if a sterner law than itself had not interfered, would have perpetuated those narrow lanes and dark closes and sunless, dark rooms which were a scandal to our social condition." There is no denying Dr. CHISHOLM's indictment. Indeed, the terrible thing about the present state of affairs is that the strongest language does not seem adequate to express the full extent of the evil, and for the sake of conventionalism much has to be left unsaid.

In Glasgow the height of many buildings aggravates the discomfort. A pamphlet was published lately by Mr. FYFE, the principal sanitary inspector of the city, in which there are photographic illustrations of places where the poor reside. They show how small houses are overshadowed by the grim walls of surrounding buildings, and when children are first brought to prison they must see little difference between their new quarters and their wynd. The minds of even the humbler classes are subject to impressions from surrounding objects, and those who are reared in little courts, where the sky would be excluded if it brought any additional profit, must conclude from what they see around them that the world is implacable and that the dark walls are like the people with whom they are destined to deal, and for whose enriching they are doomed to suffer.

If prudent regulations had been enforced much of the evil might not now exist, but as property was supposed to have rights and no duties, the covering of small portions of land with wretched dwellings was tolerated, and the dangers arising from the first neglect have been accumulating until it is now almost impossible to deal with them. Let HERCULES himself do what he may he would have to acknowledge he had failed. The Glasgow Corporation have devoted much time to the remedy of abuses and they have expended large sums in improvements. But labour and money were to a great extent unavailing, and it is confessed that the Corporation are no nearer the solution of the onerous problem than when they started.

If the conditions of the case related only to the providing of suitable dwellings, the difficulty of dealing with the question would be lightened. But every one who has any knowledge of the subject is aware that the dwellings cannot be always expected to exercise a reforming influence, and in a little time the "new houses" would be in as bad a state as those which were superseded. The human problem is more puzzling than the constructional. CARLYLE in such cases proposed that the hordes of "ne'er-do-weels" should

be allowed the option of improving themselves and their surroundings, or of standing up before a file of loaded muskets. Schemes of that kind, like many others relating to housing, will never be adopted. At the same time, it cannot be contested that if occupiers were well disposed, and regardless of their own interests, there would be a mitigation of ills which are now accepted as inevitable. But the lower class of tenants will always consider that care and cleanliness are rather for the landlord's benefit than for their own. As long as that notion prevails we must not expect much self-help from the tenants. But it is different when a constituted authority takes the place of the landlords, for even the most ignorant cannot believe that public officers are SHYLOCKS, and insist on compliance with sanitary regulations for their own gain. Municipal trading may have disadvantages, but in cases of this kind it would be well to purchase property and demonstrate how far it can be improved without demolition and rebuilding. What has been done in St. Giles by Miss OCTAVIA HILL indicates how much is practicable with a larger staff of workmen and with materials purchased at wholesale prices. The law, however, insists that when building work in the humblest classes of dwellings is undertaken it must be of a superior character and comply with regulations which were framed for a different class of buildings.

It is a misfortune in dealing with the subject that everyone is on the look-out for a remedy which can be universally applied. The danger is so vast not one but several courses of action are demanded. The utilising of the Hill system should not be taken as meaning that model dwellings are to be avoided, and the erection of such structures as the Peabody and Waterlow model dwellings need not be a bar to the erection of simple cottages in the suburbs of large towns. Most of those who assume to be authorities on housing have their pet system, and in consequence become inimical to those of other reformers. All the co-operation that can be obtained should be welcomed, but owing to the diversity of opinions the law on the subject is not uniform, and in consequence it is difficult for local authorities to determine what course they are to follow. A member of the Corporation of Liverpool described the excellence of the Act under which their operations were carried on, but he assured the congress that it would be impossible for any other city or town to obtain a similar Act. A measure which has been beneficial in Liverpool deserves to have general application, but as Parliament is now conducted there is hesitation about dealing with Improvement Bills in a broad way. Another speaker, who came from Hull, recommended the utmost decision, for as he said, if they appeared to be disposed to compromise, the judges would become doubtful and the law could not be applied to deal with a difficulty. With a multitude of projects it is impossible for Parliament or the Courts not to be dubious about what should be done.

One cause of the diversity of remedies, no doubt, arises from the difficulty of defining such phrases as the houseless, the working classes, the provident poor, and so on. In all such cases there is a tendency to take a representative man or family and suggest how his or their requirements can be met. But the inhabitants of unhealthy houses are of innumerable varieties. It is a pleasing duty to provide dwellings for policemen, clerks, storekeepers and respectable workmen; but when they obtain homes much else needs to be done. Caretakers naturally desire to let rooms to men of that class, who pay their rent regularly. The question of profits cannot be ignored, and without being a little exacting there would be few investors in workmen's dwellings receiving 4 per cent. There is, however, a residuum from whom still less profit can be expected, and to provide for that class the least costly means should be sought, for what is desirable is the removal of a danger that menaces the public health.

The Tablets in the "Hall of Fame," which is being erected in connection with the Art Institute of Chicago, will be inscribed with the names of Sir Joshua Reynolds, Viollet-le-Duc, Ruskin, Da Vinci, Winckelmann, Vitruvius, Vignola, Vasari, Taine, Pugin, Lessing, Benvenuto Cellini, Symonds and Washington Allston.

DEAD CITIES OF THE ZUIDER ZEE.*

IT suggests the impartiality of Sir JOSHUA REYNOLDS when we find him praising the Dutch painters. His ideal school was the Roman, and in spite of their splendid colouring, he was not captivated by the Venetian masters. With the latter he combined the Dutchmen. According to him, a Dutch history-piece is properly a portrait of themselves, and he goes on to say that "whether they describe the inside or outside of their houses, we have their own people engaged in their own peculiar occupations," working or drinking, playing or fighting. The landscapes, he said, were "always a representation of an individual spot, and each of its kind a very faithful but very confined portrait."

The President's words are to some extent applicable to the drawings of old buildings near the Zuider Zee by Messrs. NIEUWENKAMP and VELDHEER. They represent the selected buildings in a matter of fact style without much regard for pictorial effect, or anything beyond the subject before them. In Holland, however, it is possible to have as much pleasing light and shade as we can see along the middle reaches of the Thames, but the advantage which can be derived from such effects was not much appreciated by the two artists who have depicted old buildings in the district of Holland singled out for treatment. Apparently they prefer darkness to light, and some of their houses therefore are from their blackness suggestive of being haunted or of having been the scenes of crimes. In that respect the draughtsmen differ from the old Dutch painters, who were fond of letting the sun play over their houses and around the goods displayed for sale in their market-places. Most English visitors who have gone to Holland for their holidays would allow that CUYP in his sun-illuminated fields, where the grass is as green as in England, and in his canals, in which the bright skies are reflected, was a true realist and came nearer the truth than any photograph of similar scenes. HOBEMA, although he painted woodland views, was not afraid of sunshine. The greatest of the Dutch architectural painters, EMANUEL DE WITTE, would appear to have chosen interiors of churches as his favourite subjects, mainly because of the conditions under which light and shade are combined in them and the new qualities which light assumes when it passes through stained glass. When he painted an out-of-door scene like *The Fish Market of Amsterdam*, it was owing to the beautiful light in which he saw it bathed on an evening, and through which the sordid scene was exalted to the ideal. It is only necessary to compare RUYSDAEL's forests with those of WYNANTS to realise that misery had compelled the former to see nature enveloped in gloom. REMBRANDT, it has been said, can make his darkness equal light, but it could not be asserted that he always preferred darkness, and the so-called *Night Watch* is as dazzling in parts through the sunshine as any of TURNER'S Italian landscapes.

The places from which the subjects have been selected for illustrations in the new volume on Dutch buildings are sometimes called Dead Cities, and it is allowable for an artist to adopt any means at his command in order to impart a weird character to remains which belong to the past rather than to the present. The absence of figures, as well as the strong lines in which details are drawn, and the deep shadows which overspread most parts, are all means to an end. ALBERT DÜRER'S *White Horse* is perhaps a less graceful animal than one of WOUVERMANN'S or LANDSEER'S, but it is more full of mystery, and the longer we gaze on it we are the more puzzled to discover why the horse and the knight who owns it should stand so patiently, as if waiting for some mysterious portal to open which is destined to be always closed. As we look on the plate, by Mr. NIEUWENKAMP, of Dutch fishing-boats with sails set, we must ask, Where are the sailors who should have stowed them, but have abandoned them? The churches are deserted, and have not even a bat to enliven the loneliness. The figure in the one picture on the wall in the Edam Museum looks as if it were about to descend from its frame in order to give some animation to so large and deserted an interior. The weigh-houses are without commodities, and the East India tower, where life

once reigned and merchants haggled in many tongues, is now desolate. Like the immortal RIP VAN WINKLE, everything in Mr. NIEUWENKAMP'S volume seems to be asleep, and we ask ourselves, When is a human voice to disturb the silence? Holland has had, no doubt, its enchanters, and the Dead Cities will remain entranced until somebody can seize the magic garment and the potent wand.

There are thirty plates. The first represents the north side of the church at Monnikendam. Between the porches we see the gable of the sexton's lodge, and the man who could have had such a residence must have been an important official. Over one of the doors of the church porch is inscribed, "This door is built in all good faith with the money that has come free upon the death of SIMON NOEDZOEN. Pray for his soul." A convent existed near the church in the beginning of the fifteenth century, and it was succeeded in 1612 by the Tobias House for old folk. It measured 220 feet by 160 feet, but political economy found its way to Holland, and the Tobias House was demolished, like the convent, and turned into a market garden. The dedication of the church to St. NICHOLAS shows it was used by mariners. It is a fifteenth-century building. According to Mr. TUVN, it is basilican, as are most of the churches in the northern provinces, and especially in North Holland. The tower is a landmark, and stands on the west side of the church. The bell-tower of Monnikendam once stood beside a town hall, which has vanished. The tower is somewhat fantastic, considered as a work of architecture, but is none the less suited for a town in dream-land. We are informed that "on the south side just below the first balustrade is a projecting wooden niche in seventeenth-century style. It contains four tiny wooden horsemen, and every time the full hour strikes, as soon as the last sound of the bell has died away, these ride out from the pent-holes, and the figure of FAME above the niche raises the trumpet to her mouth and produces a few grating sounds far from melodious." From Edam, the south porch of the church, which is also dedicated to St. NICHOLAS, and a couple of views of the museum are given. There is a great dam, which is crossed by a stone arch, that was the cause of many lawsuits. It is characteristic of the people that on either side of the dam are seats, with fine wrought-iron backs. The museum is an old and most interesting dwelling-house, which was purchased in 1893. We give a reproduction of one of the blocks, showing the steeple of the church of Our Lady at Edam. The church was removed about twenty years ago. The steeple has a carillon of sixteen bells. The lower structure is of brick and hewn stone, the octagonal part is of hewn stone, and the spire is of wood cased in lead.

The harbour tower of Hoorn is familiar to many tourists. It was erected between 1532 and 1651 at considerable expense, and the inhabitants have reason to be proud of it. The church of St. Mary is a good specimen of Dutch Gothic, and was built in the middle of the fifteenth century. The interior is pleasing from the combination of timber and stone; the turret is approached by a staircase which, we are told, is ingeniously planned and beautifully finished in late Gothic style. The east gate was built in 1578; at a subsequent time it was surmounted by a structure for observation or for residence. It was claimed for Enkhuizen that in the seventeenth and eighteenth centuries it was the greatest and wealthiest of the cities of the Zuider Zee, but owing to the silting up of the harbour it has fallen from its high estate. One of the subjects represented is the Dromedaris Tower, which is approached by a double drawbridge; it was constructed in the sixteenth century. On one of the stones is the following characteristic motto, "Blessed be the town and much to be praised that provides against war in times of peace," words which were no doubt known to the Boers in South Africa. Enkhuizen has its church of St. Pancras, which was built in 1422. The church stands on a reed-bed; the walls have consequently settled. The interior used to be painted with scenes from the Old and New Testaments, and the master-painter was allowed a fixed income that he might live honestly and provide for his family. His work was, however, concealed by yellow paint in 1609. The church of St. Gommer was built in rivalry to St. Pancras, and the adjoining building was surmounted by a

* *Old Dutch Towns and Villages of the Zuider Zee.* By W. J. Tuyn. Illustrations by W. O. J. Nieuwenkamp and J. G. Veldheer. (London: T. Fisher Unwin.)

wooden bell-tower, which was used temporarily. The East India tower was at one time known as the English tower, and forms part of a picturesque group. Medemblik possesses an old castle which is supposed to date from the thirteenth century; it is now being restored, and will probably be utilised as a court-house. The church of St. Boniface is of a characteristic type, and the houses nestling around it combine to create a pleasing picture.

Buiksloot is one of those villages which somehow win the hearts of seamen, and where they delight to live in the intervals of their voyages. Some Amsterdam people resort

seen anywhere, and the furniture, although simple in the extreme, is thoroughly good. The little flower-gardens share in the general tidiness. The Broekers carry their love of cleanliness often to the extent of preferring to go without food rather than soil their pots and pans. No smoke or dirt of any kind is ever seen in the kitchens; the kitchen grates, indeed, are seldom, if ever, used for cooking purposes. The back kitchens are always fitted with small fireplaces, where the general cooking is done. All the houses have two doors. The steps to the front door are removed, leaving a space of two or three feet between the level of the door and the street. This door is used thrice at most for each member of the family, namely, for

CHURCH OF OUR LADY, EDMAM.

to it in the summer, and it is less exciting than Scheveningen. It recalls one of the Essex amphibious villages. Nieuwendam is of a similar class; but it must have been of some note at one time, for it possesses a coat-of-arms which consists of "a field azure with swan silver, billed, footed and collared;" the shield is surmounted by a golden crown. The village of Broek is one which Dutch men and women consider to be a model for universal imitation, and VAN DER AAS's account may be quoted:—

The cleanliness for which this village is justly renowned shows itself even more in the interior of the houses than outside. Everything shines; not a speck of dust or dirt can be

baptisms, weddings and funerals, on which occasions a loose step is placed in front of it. The small door at the side is the ordinary house door. Each house has also a best room, which is never used except on the occasion of a wedding or a funeral. The streets of the village were laid in 1661, and are kept so scrupulously clean that one is almost afraid to walk over them in one's boots. They are strewn with white sand in little patterns along the fronts of the houses. Everything that could possibly bring dirt into the streets is carefully kept away. It is not even permitted to walk about with a lighted pipe. This is prohibited not only on account of cleanliness, but also for fear of fire. Once a month there is said to be a general inspection of the streets to insure their being kept in perfect condition.

There are also descriptions and illustrations of Dordrecht, Volendam and Marken, which are likewise quaint and almost as suggestive of shipwright's work as of a builder's, for, according to ANDREW MARVELL, "the Dutch with mad labour fish'd the land to shore." It is remarkable that so much of a family likeness should be exhibited by the towns and villages which border the Zuider Zee. The people all have a common interest in that unique expanse, and it would be difficult to convince even young children that any danger can arise while they are amusing themselves in small boats or rafts which they have put together. In representing such typical buildings black is more expressive than a variety of colours, and although, as we have said, strangers might suppose that Holland is a place of universal gloom, the plates are a triumph of a certain class of draughtsmanship. The bordering by Mr. VELDHEER has an aquatic character, and adds to the interest of the pages. The printing is creditable to the Gresham Press, and the volume will form an attractive table book.

THE BORGHESE "NIOBE" AND "HECTOR."

THE well known but pathetic figure of NIOBE and one of her children, which she is endeavouring to shield from the arrows of APOLLO, was considered by OVERBECK to have formed part of a group. In his "History of Sculpture," he has, therefore, united various figures which will exist, but as there is more or less doubt about the relativity of them, it cannot be said the arrangement is entirely satisfactory. The subject was one which appealed to Greek sculptors, and it is likely there were several representations of the tragedy. NIOBE was the wife of LAMPHON of Thebes. In days when Olympus was believed to be not far from Greece, it did not seem unreasonable to suppose that the goddess LETO and NIOBE would have been playfellows in early days. But as the goddess only possessed two children, APOLLO and ARTEMIS, while NIOBE was the mother of fourteen, the mortal exalted herself above LETO. We must not judge Greek morality by a later standard, according to which a little maternal vanity would not be looked upon as a serious crime. But NIOBE interfered, as is said, with the priestly revenues, for she prevented her subjects from offering gifts to LETO and her

children, on the ground that as queen she had more claim to them. In Thebes, as in London, so large a family was likely to be expensive, and the English matron will sympathise with poor NIOBE'S efforts to make ends meet. All the goddesses were merciless when their dignity was diminished, so LETO resolved to wreak her revenge on the Theban woman who had been her companion. APOLLO and ARTEMIS were not indisposed to be the instruments. The two archers shot their arrows against the family group, and the children fell. Eventually NIOBE was transformed into stone, and it was long believed that her form could be recognised on Mount Sipylus.

In the relief which at one time was found in the Villa Borghese, variety is obtained by the introduction of horses. As they have not been touched it becomes more evident that the aiming of APOLLO and ARTEMIS was directed against the children alone. It was no haphazard shooting, but was in deadly earnest, and inflicted death on victims who apparently had no part in their mother's presumption. The treatment consequently excites pity and terror, thus corresponding with the Greek laws of tragedy. Although the celestial death-dealers are invisible, yet from the up-turned eyes of some of the victims it is evident they are above Thebes, and it must be felt that, like Fate, their power is without limit.

The relief we illustrate has one advantage over the group arranged by archæologists, because we are certain that the

THE DESTRUCTION OF THE CHILDREN OF NIOBE.

THE RECOVERY OF THE BODY OF HECTOR.

work expresses the sculptor's idea of unity. There is no doubt, on the contrary, that from the time when the first fragments were discovered in the sixteenth century many figures were utilised from time to time to complete the supposititious grouping, although there was not a tittle of evidence to show that they formed a part of the original group or of a copy from it. It is possible that some of the figures may have formed part of different representations of the scene by other sculptors, but in many cases we believe it is not certain whether the figures possessed any relation to the legend. An important archæological problem therefore still awaits all those who have the patience to make a new arrangement, but we question whether a solution with which all will agree can ever be ascertained.

Although we may admire the action of the figures in the bas-relief of the NIOBE, yet it is difficult to admire the subject. In the other relief, however, relating to the

subject. In the other relief, however, relating to the

recovery of the corpse of HECTOR, there is more of an appeal to ordinary human feelings. The work was probably executed by a Græco-Roman sculptor, or, at all events, he has modelled it with a view of gratifying Roman imagination. HECTOR was of more interest to the Latin race than ACHILLES. In their opinion right was on the Trojan side. During the Renaissance period a similar view was taken, and the play of "Troilus and Cressida" is proof of its influence in SHAKESPEARE'S time. In fact, it is only from a comparatively recent date that people have endeavoured to regard the death of HECTOR from a Greek standpoint.

The relief has not the singleness of action which we see in its companion. It represents two incidents. First, PRIAM is seen kneeling before ACHILLES—only a part of the hero is shown—and appealing to him for the body of his son. The attendants bear the vessels which were to be offered as a ransom. The second incident shows HECTOR'S body arriving before the gates of Troy, where it was met by some of the members of his family. As ASTYNAX, HECTOR'S son, was only a baby in arms at the time, the youthful Trojan introduced may be TROILUS, the younger son of PRIAM and HECUBA.

The Borghese Collection was at one time the most valuable of all in Rome outside the Vatican. PAULINE BONAPARTE having married Prince CAMILLO BORGHESI, NAPOLEON was able to purchase the collection from his brother-in-law and place it in a special gallery in the Louvre. Some of the antique works were afterwards returned, and we believe all the contents of the Borghese Collection which have survived may now be looked upon as the property of the Italian nation.

ABBAY OF ROSS.*

THIS "abbey" is situate on the Galway side of the Black river, which separates that county from Mayo. It is distant two miles from the town of Headford, in a very secluded spot, and is perhaps the least known of the larger monasteries of Ireland, notwithstanding that it has formed the subject of a very interesting little book of eighty pages, by the late Oliver J. Burke, a second edition of which was published in 1869. There is also a brief notice of it in Sir William Wilde's "Lough Corrib," and in Duffy's *Hibernian Magazine* for 1862-61 the late Rev. C. P. Meehan contributes some valuable matter from the Louvain MS. (See also Father Meehan's work on the "Rise and Fall of the Franciscan Monasteries.")

The date of its foundation is placed at A.D. 1351. The "Four Masters," the Louvain MS. and the Rev. Luke Wadding all agree on this point. In A.D. 1470 the monks adopted the rule of the strict observance. About the year 1498 additions were made, and the abbey was considerably enlarged.

From the time of its suppression in 1538 until 1753, the monks were seven times expelled, but after a period they each time returned again until 1753, when they returned no more. After its suppression the monastery had been granted to the Clanricardes, and that family assisted the friars from time to time. In 1580 a regnant was made of it to the monks, but in the same year they were again dispossessed, and the abbey was plundered. During the wars of Elizabeth, in 1596, it was occupied by a portion of the English army then in Connaught.

In 1611 it was again in the hands of the Earl of Clanricarde, who restored the monks, only to be expelled again in the following year; they returned in 1626. In 1641 Father Bryan Kilkenny was guardian, and in 1647 an important chapter of the order was held in the abbey.

The Cromwellian soldiery took possession of and rifled the abbey in 1656; the monks, hearing of their approach, had vacated it. In 1664 the monks returned, but in pursuance of the Act 9 William III. chap. i. entitled "An Act for banishing all Papists exercising any ecclesiastical jurisdiction and all regulars of the Popish clergy," the monastery was again suppressed; this was in the year 1697. With wonderful perseverance they again returned; they are found here in 1715, where they remained until 1753, in which year they left the monastery for the last time, and retired to a small island formed by the Black river, within view of the lofty tower of the abbey. The foundations of this temporary abode still remain. Later on they removed to a site at Kilroe, where they built a convent on the property of Mr. Lynch, of Ballycurrin Castle, which, however, they abandoned in 1840, in which year the roof of the abbey church had fallen in.

The ruin is approached by a causeway and gateway; the causeway was made through low-lying grounds then nearly always covered with water, and the gateway was in the enclosing wall and ditch which surrounded the few acres of land attached to the monastery, the extent of which can still be traced by the remains of this ditch.

The buildings as they now stand are the most perfect of any such ruins in Ireland. The style of architecture was plain, and, owing to the hardness of the stone and the absence of carving, the work has suffered but little injury; indeed, if it were not for the practice, which ought to be discouraged, of turning the church and cloister into a common graveyard, the walls of the church and extensive domestic buildings are fit to be re-roofed, and if this were done the order might be able to return to their monastery.

In entering the church it will be observed that the west window is not immediately over the door, but is south of it. This, however, leaves the window in its proper position internally in the centre of the nave, which is 20 feet 7 inches in width and 57 feet 3 inches in length, and the door is in the centre of the space comprising the nave and aisle, together measuring 30 feet 5 inches in width. The nave is separated from the aisle and south transept by an arcade of four arches. This transept is divided into two by two round-headed arches and a short wall; its measurement is 33 feet 8 inches north to south and 49 feet east to west. The transept has two east windows, before each of which stood an altar, and between these windows an arched opening leads into a small lady chapel, 24 feet by 18 feet, with a good east window, and side-lights of later date. The transept contains two large windows in the south wall with mullions and tracery.

The tower, as is usual in Franciscan houses, has been inserted after the church was built, and is likely to be one of the additions made in 1498. This tower is remarkable for the lowness of the arch giving access to the chancel, and as having another arched opening over it looking towards the nave, which seems to have served the purpose of a rood-loft. Before this opening was displayed the holy rood in the usual manner intended to be seen from the nave of the church.

There is a small chantry near the entrance, south of the aisle, of seventeenth-century date, erected by the Jennings family.

The choir is 53 feet 7 inches by 20 feet 7 inches, and is lighted by a fine east window, under which the high altar stood, and by four side-lights in the south wall. The chancel is greatly injured by the erection of modern tombs, one of which has been placed in such a position as to permanently disfigure the structure. There are now no openings in the north wall of choir; that to the sacristy is blocked up; there are traces of an organ-loft in the choir adjoining the tower.

The conventual buildings form a most interesting part of the abbey. The plan of the Franciscan house was not so well designed as in the Cistercian order. In the latter, given almost any portion of the structure, it would not be difficult to follow out a plan of the whole, but there is no such consistency in the houses of the other orders. There is generally a diversity as to the number of the apartments, and frequently as regards their location. Ross is therefore interesting as showing almost all that was required in a perfectly equipped Mediaeval monastery.

The cloister lies to the north, though sometimes, as was the case at Castledermot and elsewhere, it lay to the south. The cloister garth is very limited in area, only about 30 feet each way. The buildings grouped around this space in the usual manner are necessarily limited in extent, and it was therefore found necessary to provide another area or court about 28 feet square, around which the requisite additional buildings are provided. The principal of these are the refectory, a large apartment 37 feet long by 20 feet 6 inches wide, provided at its north-east angle with the usual reader's pulpit and the large kitchen at the north-west angle of the buildings. Immediately adjoining are the remains of the mill. A stream of water, the course of which may still be followed, flowed by the east side of the abbey and under the garderobes at the north-east angle, along the north side direct to the mill and from thence to the river, a few yards distant.

There is a three-storey building adjoining the choir on the north side, which is described by the late Oliver Burke as the sacristy with guest-house over. This structure is known locally as Burke's Castle, and is evidently not part of the original design of 1351. The sacristy is a smaller apartment nearer the cloister, and it would be a very unusual, and indeed a very undesirable place to have the guest-house so near the sanctuary and communicating directly with it. The guests were usually lodged nearer the entrance to the precincts. If this were a Cistercian house we might expect to find that the abbot or prior was lodged in such a position, but here it was probably the guardian or provincial. The head of a Franciscan house was elected for three years and was chosen from amongst the brethren. At the end of his term he resumed his former

* From the Journal of the Royal Society of Antiquaries of Ireland.

position, and he generally occupied the same quarters as the other brethren. It would therefore seem there was no necessity for a distinct lodging for the guardian, in which case the apartments were probably occupied by the distinguished ecclesiastics, such as the provincial when intending to hold a chapter. The position of a chapter-room in a Franciscan house is not satisfactorily settled, and in some places it is not clear that there was such a provision. At Ross, Oliver Burke, the author before quoted, locates the chapter-room on the upper floor over the bakehouse. If this were its position it would be a strange one. The provincial chapters were large gatherings, and could not be accommodated in such a small apartment or in so inconvenient a position.

The abbey of Ross was the parent house of Donegal Monastery. In the year 1474, when the Franciscans were holding a provincial chapter, Nuala, the wife of Hugh Roe O'Donnell, came with a brilliant escort to ask that a branch of the order should be established in her husband's country in Tirconnell. Her request was at first refused, but owing to her persistence it was eventually acceded to, and a colony from Ross set out with her for Donegal, where in a few years the monastery at that place was completed for their reception, where the "Annals of the Four Masters" were compiled by the Brothers O'Clery in A.D. 1636, the successors of the monks who left Ross in 1474.

Repairs were effected here in 1880, but as usual at that period the ivy was not cut. It had overgrown the structure greatly, and arrangements have been made for removing it. The caretaker looks after the burials, but cannot prevent entire strangers burying in the ruins, already overcrowded. It would be very desirable that further interments should cease.

VICTOR HUGO'S HOUSE AT GUERNSEY.

A SHORT walk up a winding street that leads from St. Peter's Port brings the traveller to the house where Victor Hugo spent his years of exile. When first he left France, says a correspondent of the *Manchester Guardian*, he took refuge, I believe, in Jersey; it is the island chiefly frequented by French visitors, who come but little to Guernsey and least of all to Sark. It was therefore suggested to the distinguished exile that it might be better for his own and everybody's quietness and satisfaction if he settled a little further from his native shores. Victor Hugo took the hint and withdrew to Guernsey, and was received with a kindness which he never forgot. For sixteen years he dwelt here, in perfect peace and seclusion, almost within sight of France, although under the British flag, and no one who reads the exquisite dedication of "Les Travailleurs de la Mer" and its introductory chapters can fail to see how completely he made himself at home in Guernsey, mixing with the people, making an annual tour among the islands in August, studying their usages and history, and saturating himself in the atmosphere of this interesting archipelago.

Hauteville, as the house is called, is in no way different, to outward view, from the other substantial, old-fashioned residences which adjoin it. Two large shrubs stand in front of it; that is all. Victor Hugo made it what it is within. It belongs to the poet's grandson. But the family seem anxious to allow the public to make it a place of literary pilgrimage, and anyone who mounts the steps and rings the front-door bell (as I did, with some misgiving) is sure of a kindly welcome. No charge is made, but one gives a gratuity to the housekeeper, who acts as a guide. As far as possible the house is kept as the poet left it. The decorations and arrangements are curious and striking, suggestive of the original and unconventional tastes of the man. You are shown, on the ground-floor, the billiard-room, with its heavy and massive furniture. The dining-room is completely lined with old Dutch tiles, which it must have taken some time to collect. Some pieces of rare and curious china also adorn the walls. The drawing-room has a sad and forsaken look of faded elegance. The library and some other rooms are more inviting, but are overdone with heavy pieces of old oakwork, collected evidently from all quarters, and put together, in some instances, without much sense of beauty or fitness. You find stools and benches made up of Gothic stalls from a church side by side with bits of Renaissance carving. All is imposing and massive, but hardly cheerful. One feels that Hugo loved to surround himself with a certain strange, old-world grandeur, while gratifying after his own fashion the instincts of a collector. One is reminded, in some sort, of Sir Walter Scott and Abbotsford. It is clear that Hugo was thinking rather of the dignified reception of guests than of his own comfort. Though he never smoked, he fitted up a handsome smoking-room, furnished with every comfort. It is when you go upstairs that you begin to arrive at the real man. There is a bedroom, not large indeed, but sumptuously furnished, as if for a monarch, wherein the French champion of national liberty hoped to receive Garibaldi. But the wielder of the pen was disappointed; the wielder of the sword was unable to come. At the

very top of the house you arrive at a large attic, covered in with glass, like a greenhouse, and overlooking the harbour. It commands a noble view right over the sea, and looks towards France. You can see Sark and Herm and Jethou, and the archipelago of isles that stud the Channel. Here, at a little wooden desk, the old man stood as he wrote "The Toilers of the Sea." The desk seemed a low one; but Hugo, though rather stout, was short of stature. The original MS. of the volume contains the following notes of its composition:—"Commencé le 4 juin, 1864; interrompu le 4 août; repris le 4 décembre; terminé le 29 avril, 1865." His habits seem to have been exceedingly simple. He would sometimes take his meal at a restaurant in the town. He knew every part of Guernsey well, walking often at Pleinmont. His literary work he attacked, like Ruskin and like Scott, in the early morning. He frequently began writing at 4 A.M. At the close of Part I. of "Les Travailleurs de la Mer" he makes a note—"3 août, 8 heures $\frac{1}{2}$ du matin." When the day grew hot he retired to sleep awhile on a low couch in a little room adjoining. The older people at Guernsey have many kindly reminiscences of the poet's sojourn among them.

Never was nobler return made for kindness than the return made by Hugo in his great romance for the hospitality of the Guernsey folk. "Les Travailleurs de la Mer" is an epic of the Channel Islands. The younger generation of readers has forgotten, if it ever knew, the sensation made by the book at its first appearance. Wild, extravagant, grotesque it may seem at times. It lacks a due sense of humour. The second volume seems spun out; the story is too often stopped for digressions, descriptive or ethical. It is like reading "Tristram Shandy," but without the abundant humour. Yet it breathes the very air of the Channel Islands; it conveys their colour and charm. You can hardly enter aright into the spirit of the tale until you read it amid the cliffs and caves of Sark. Few, indeed, would warrant the truth of all it tells concerning the archæology and history of these islands. The author is a romancer; he is a great rhetorician also. His derivations may be often at fault. He doubtless idealises the scenery and the people. Yet the general outline is true, the local colour just. The impression conveyed, though it reaches us through a halo of light like a landscape by Turner, is a just impression, after all, of the scenery before us. There is hardly a passage in literature so true and accurate in describing the scenery of granite rocks at low tide—so remote, mysterious and relentless—as the opening chapter of the second volume.

ARCHÆOLOGICAL EXPLORATION IN CHINESE TURKESTAN.

A REPRESENTATIVE of Reuter has had an interview with Dr. M. A. Stein, who is returning to India this week after making a preliminary arrangement of the remarkable finds brought to light during his recent expedition in Chinese Turkestan. The cursory examination that has so far been possible within the short time available reveals in a striking manner and for the first time many points bearing on the culture and daily life of localities which for many centuries—some for nearly 2,000 years—have been buried under a sea of sand, and whose history has hitherto been practically a blank. Dr. Stein said:—"A full investigation of the sculpture, fresco painting, objects of industrial art and seals, &c., which were dug out of the temples and dwelling-houses of sand-buried sites will help us to resuscitate the civilisation of a region which has played an important part in history as the link between ancient China, India and the classical West. As showing the extent to which the desert has advanced, I may say that some of the settlements I excavated are situated fully a hundred miles beyond the edge of the present cultivated area. No doubt can be entertained that the inhabitants of these places were in possession of a culture mainly derived from India, and that they were Buddhists. My excavations go to prove that their culture was highly advanced and that the art influences of Greece and Rome were felt even at that great distance from the centres of classical culture. Khotan is, I should say, about halfway between Pekin and Western Europe. Possibly the most striking excavations I made were at a site in the heart of the desert north of Niya, where one settlement was exposed covering with its scattered dwellings and shrines an area of about six miles by four. Until digging began all that was visible were weird-looking rows of bleached timber pieces projecting in various places like the framework of a wrecked ship from between the sand dunes." Dr. Stein's excavations have yielded a large quantity of Sanscrit, Chinese and Tibetan manuscript, all in good condition, also some colossal specimens of stucco statuary.

A New Wing to the Royal Albert Asylum, Lancaster, was opened last on Thursday in last week. Messrs. Austin & Paley were the architects for the addition, which cost over 20,000/.

NOTES AND COMMENTS.

BREMEN still carries on an extensive trade with this country. It was one of the Hanse Towns, and therefore had a share in the "Steelyard" of London, which in old days was one of the principal commercial centres of Europe. CHARLEMAGNE constituted Bremen as a bishopric. Subsequently an effort was made to incorporate it with Hamburg as an archbishopric, but the contests which arose were so serious that eventually, in order to put an end to them, Bremen became an archbishop's see. The first cathedral was, it is believed, a wooden building. Then it was superseded by one in which stone was used. That building in the year 1043 was destroyed by fire. The present structure is thought to have been erected in 1160; its length is about 300 feet and its breadth 124 feet. Since the seventeenth century the cathedral has suffered much. In 1638 the southern tower fell and destroyed several houses, besides killing eight men. In 1656 the north tower was greatly injured by lightning. In the frequent wars of the time the town had various masters. It was conquered by the Swedes. Subsequently it formed a part of Hanover. Then it was recognised as a free city. In 1810 NAPOLEON made it a part of the French Empire, and three years afterwards it again became independent. The cathedral was neglected amidst so many changes, and it was not until about fourteen years ago a serious effort was made for its restoration. The works were at first carried out under the direction of MAX SALZMANN. On his death in 1897 the task was taken up by Herr EBHARDT, and under his direction they have been brought to a close. A sum of 140,000*l.* has been expended, and in order to raise a part of the money some of the cathedral estates have had to be sold. The revenue of many institutions connected with the cathedral will consequently be diminished, and unless Government will come to the aid of the citizens much inconvenience will follow.

M. HENNER, the French painter, does not produce many works, and he is too modest a man to care about advertising himself, but a story relating to him has gained admission in the French papers, and excites interest because the painter trusts to his works alone for reputation. It appears that M. HENNER, in talking with a provincial prefect, said that about the year 1864 he painted the portrait of a young lady from Poitiers, which he considered to be one of his best works. On that account he wished to know what had become of it. The prefect, on his return to Poitiers, set to work in the official manner. In the first place, he endeavoured to trace the whereabouts of the subject. Then he discovered that the lady had quitted the world and was a nun. As prefects have no official right to enter convents it was necessary to find someone else who could make the necessary inquiries. Fortunately such a person was available. It was then ascertained that M. HENNER's work was in the possession of a brother of the nun, but unluckily it had been operated on by some provincial painter, who, at the desire of the family, had added a nun's veil and lengthened the canvas in order to represent the lady in her conventual habit. M. HENNER is undemonstrative, but his quiet atelier in the Place Pigalle must have witnessed a display of wrath that was excusable when the artist heard of the treatment one of his best works had gone through.

It does not look well when we find the subjects of the Royal Academy lectures on chemistry, anatomy and the demonstrations are announced, while only the dates are given for the courses on painting, sculpture and architecture. Some people will ascribe the cause to the difference between science and art. Science is supposed to be prepared for whatever it undertakes, but art depends on inspiration, or something resembling it, which only comes at intervals. Students cannot be expected to appreciate lectures which are a surprise to them, and for their sakes the policy which is extending of leaving the choice of subjects until the last moment should be avoided. The Academy professors are not like essayists who write for journals or magazines, and who are expected to present subjects which are novel. The chemistry lectures begin on Monday next at four o'clock, and they will be continued by Professor CHURCH on the succeeding Thursdays and

Mondays until the 24th inst. They will treat of "Grounds for Painting," "Classification of Pigments," "New or Little-known Pigments," "Selected and Restricted Palettes," "Vehicles and Varnishes," and "Conservation of Paintings and Drawings." Professor THOMSON's course will begin on the 28th inst., and the first of the anatomical demonstrations will be on November 18. Lectures on the arts will not be given until 1902.

POCKET-BOOKS which can be carried in a pocket without inconvenience appear to be more recognised as a necessity. The latest addition to them is the "Cement Users and Buyers' Guide," published by Messrs. E. & F. N. SPON, the originators of technical pocket-books. Its purpose is "to enable buyers to get out their specifications, to help them in deciding as to where and how to buy their cement to the best advantage, and also to enable them to keep from making complaints excepting when warranted." The information is condensed, but represents the results of many years of experimenting. Suggestions are given for tests which can be performed in an office. There is also advice about the use of cement and its storage. Finally, there is a list of cement makers, which will be useful to architects and engineers as well as to contractors. We are glad to see that the author recognises the excellent work of the late JOHN GRANT, a man who, beyond any of his contemporaries, gave precision to what was known concerning the material.

CATHEDRAL SERIES.—CHICHESTER. ANCIENT SCULPTURE IN WALL OF SOUTH CHOIR AISLE.—"THE RAISING OF LAZARUS."

WHEN the South Saxons were converted to Christianity and a bishop was appointed, his stool or settle was placed in a church in Selsey which was dedicated to St. Peter. That bishop was WILFRID, archbishop of York, who had been driven into exile and wandered southward until he had found a refuge with King ETHELWOLD. Selsey was, however, from its situation liable to invasion by sea-rovers, and at length it was thought advisable to remove the bishop's chair to Chichester. The change took place in 1075. It is not surprising that the memory of the original building at Selsey was not quickly effaced, and it is possible that many objects were transferred from the old cathedral to the new. The majority of those relics have disappeared, but in Chichester the belief prevails that a few examples of sculpture in relief which are met with in the cathedral formed part of the ancient church which was erected under the supervision of St. WILFRID. But there is no mention of them in any record relating to the cathedral, and it is not certain in what part of the existing building they were formerly exhibited. They must have been considered as precious, for they were concealed behind the stalls, and were not brought to light until 1829. It is suggested that they were placed where they could not be seen when it was found that Chichester was unable to hold out against the Parliamentary forces. The cathedral suffered much, and indeed their fury caused them to break the Table of Commandments, which is not idolatrous stonework, into shivers, and the Bible was marked in divers places with a black coal. We are told how the soldiers defaced the monuments, hacked and hewed the seats and stalls, and picked out the eyes of a statue of EDWARD VI. under the gaze of their commanders. There must have been special reasons which made the Bishop and Chapter so anxious to preserve examples of archaic sculpture, which as works of art could have had little relative value. We should also remember that the oldest part of the cathedral has not been adorned by the sculptor's art, and the reliefs would be superfluous in the building; nor can we consider them as English in style, and it is not unlikely they are foreign works which came by sea to Selsey, and for reasons now unknown were esteemed.

ANCIENT DOMESTIC ARCHITECTURE.

By the late G. E. STREET, R.A.

IT is impossible to look attentively at the modern attempts at a revival of ancient domestic architecture in this and other countries without feeling that there is much want of success and much unreality in most of our efforts. The question whether this all arises from some incompatibility of the old style with modern requirements, or whether it is not rather the mistaken way in which the revival has been attempted, is one which I think it will not be waste of time or of trouble for us to consider and answer if we can.

Unquestionably our revival of ecclesiastical architecture has been by far more uniformly successful than that of domestic, but this seems to require little explanation. It is the result simply of the fact that men are more generally interested in the one than in the other. And I believe that by the time we have interested the world in the revival of domestic architecture we shall find that we know how to build houses very much better than we do now.

In our modern efforts there seem to be two or three very obvious faults. One, the too close copying in all our works of the latest kind of Third-Pointed work without much attempt at adaptation. Another, that in these attempts the external effect only has been thought of, whilst in the interior we have imitated all the faults of regular nineteenth-century house builders, and consequently feel a painful sense of unreality in all our works. The result is that as the eye only has been appealed to, our works have been utterly unsuccessful because our reason has been unsatisfied. Now, to produce any effect of lasting and real pleasure there must be very much beyond a mere attempt to please the eye. I suppose we all know this and yet I confess it seems to me that if we do but few of us act upon our knowledge; for of all the buildings erected in any so-called Gothic style of late years, there are scarce any exceptions to be found to this gravest of faults.

Our Classic artists seem to glory in the same error; not a building do they erect in which one can trace any attempt to show a reality and truthfulness in all the component parts, and so scarce any which can satisfy the mind as well as the eye. Their long rows of uniform windows, lighting rooms of all kinds, from pantries up to drawing-rooms, their sham windows where no light is required, and all their other shifts to preserve uniformity, are all proofs of their utter want of perception of the first of all rules of ordinary building and design—the law of truthfulness; and in the greatest of modern attempts at revived Christian art the same error prevails to a perfectly fearful extent. The half mile of window and buttress, window and buttress, with all their dismal and dreary similarity, cloak an irregular and unequal internal arrangement. On one side windows are built but to be blocked up, either altogether or by floors abutting against them in mid-height, and in this the seat and palace of our Parliament, it would puzzle any one to discover after a perambulation of the exterior and a diligent search in all its monotonous courts, where or of what nature its halls of assembly are. And can this be real art? Is it not rather a mere mockery of those old men whom we pretend to imitate? For do we not know how thoroughly each foot of their walling told its real purpose? There was no mistake in their work; they never thought of such a thing as the planning and erection of a building, and the addition of a front to it which should bear no reference to all that plan and arrangement. Nor would any great artist in any time have pretended to do so. I confess too it has always seemed to me that Greeks and Romans had in their works much more truthfulness than their nineteenth-century successors and imitators ever allow themselves to show.

Reality therefore is the great law to be attended to above all others in architecture. In it are included all other laws which give life and vigour to our work, and without it no attempt can be, even in a slight degree, successful.

In proportion, then, as our work is entirely and undeniably real, so exactly is it good in the first place, and this necessity is far above the necessity for correct detail, for accuracy of mouldings and the like. Add these last to the first and you make a perfect whole. But use them by themselves, as is now most frequently the case, and you have a meagre and unsatisfactory result; one indeed much more so than is the adoption of the first principle of reality without the practical knowledge of the science or history of mouldings or styles. In fine, what has been said of church building may almost be said of all other work, "That feeling without knowledge is better than knowledge without feeling." And I think we have a very striking example of the effect of truthfulness upon design if we examine the difference of idea exhibited in the general proportions and arrangement of modern houses as compared with those of old ones. But as this is of no little importance it is desirable, even at the risk of being tedious, to say a few words upon it. Now we all know the modern idea of a Gothic house, the great feature of which it seems ought always to be that it should have as many gables as possible in the smallest given

space, and that he therefore is the acutest architect who so arranges his plan as to be able to satisfy this necessity. But this is certainly contrary to old canons. Mediæval builders always, I think, strove as much as they could to simplify their plans, and no doubt in so doing they were right. The consequence is that in old designs one sees long lines of roofing and no attempt at a display of gables, except where they are positively necessary. I might give you instances of this without number. The famous hospital at St. Cross is one. In its large and irregular quadrangle there is, I think, scarce one gable to be seen, and yet the effect is much more really Gothic than any modern building I know.

St. Augustine's College at Canterbury, again, owes much of its effect to the great and unbroken length of its cloister, with a dormitory above, which forms the northern side of its quadrangle; but examples in illustration of this will occur to almost every one, so that I need scarcely repeat them here, and you will all see how valuable an example of the benefit of reality this difference gives us.

There are, however, certain difficulties in the way of the correct and complete restoration of the ancient domestic architecture of this country which are not attendant upon the revival of its ecclesiastical architecture. And it is my intention this evening to point out as well as I can, in a rough and hasty survey, wherein these difficulties in the main consist, and how far they are such as by a proper recurrence to the first principles of truth and reality may be overcome.

The inquiry is of importance to us because, as I am sure must have occurred to the minds of almost every one who hears me, there is in the world generally an impression that the revival of ecclesiastical and domestic architecture are two entirely distinct things, in no way dependent upon each other and not proceeding upon the same principles.

Now this is an error which first of all I desire to meet, because it is just the error which most militates against any improvement upon our present position. It is by this error indeed that we must explain the very curious way in which the domestic development lags behind the ecclesiastical, though at the same time the fact that the cause of religious truth is more identified with the latter has been also a great reason for its greater progress.

I think that it will be generally allowed that, viewed simply and irrespective of the question of internal comfort or convenience, there is no reason whatever why our houses should not be built upon precisely the same architectural principles which we recommend for use in our churches.

I say this upon the assumption that however much the symbolic principle may have had to do with particular arrangements and forms, still the main features of the Pointed styles of architecture were clearly constructional, and all arising mediately or immediately from the invention of the Pointed arch.

Ancient buildings certainly prove this. In the thirteenth and fourteenth centuries it was never held that a Pointed doorway or window was fitted for use only in an ecclesiastical building; on the contrary, the arch was as constantly used in the one class of buildings as in the other, and always in both cases, I believe, because it was the very best principle of construction with which the old architects were acquainted. With us the case remains still the same; we know no better means for carrying the weight of a great wall than the Pointed arch, and therefore we ought to use it everywhere; and I can neither appreciate nor understand the particular principles or frame of mind which can characterise any architect who boldly uses and displays the pointed arch in all his ecclesiastical work, and as carefully eschews all appearance of acquaintance with it in all his domestic work.

I must assume, therefore, until I see the contrary demonstrated, that there is no reason why the same principles of construction should not be applied in the erection of all buildings wherein similar materials are used.

The main reason upon which I can understand that Pointed architecture may be rejected from domestic use is its presumed unfitness for use in these more civilised days, and its lack of such expansive power as would enable it successfully to adapt itself to modern wants.

It is this expansive power which, practically, I see denied in ninety-nine buildings out of every hundred erected in what is called "the old English style," and which, nevertheless, I am anxious to claim for the art.

In many respects there is no reason whatever why Pointed architecture should not be far preferable to any other, and this is specially true in the case of ground plans, in the scope it gives for providing for every want in the most natural and in the most simple manner; not tied down by any presumed necessity for regularity of parts or equality of division, but rather rejoicing, when necessary, in the picturesqueness often attendant upon necessary irregularities.

Need I contrast our position herein with that of Classic architects? Indeed it would be a mere waste of words. In other points the same advantage exists. We are able con-

sistently to use every material which presents itself fit for use. We feel no advantage in compo over rough wall, and are able avowedly to use every material which is (as e.g. are rough stone walls) itself thoroughly good and real. We are able to use steep roofs and so to meet the necessities of our climate; whilst at the same time we keep to the old traditions of our land.

But there are instances in which in our revival of Pointed architecture we have failed, either by neglecting to secure those conveniences and adaptations to altered manners of life and society which all sensible men require, or by, as we so often see, satisfying ourselves with a very small portion only of the true principles of the old style, and so producing a mongrel architecture, which has the merit only of being a makeshift until better times may be had, and which seems to have afforded a convenient gap for an escape to many men in late years, who in their hearts convinced of the folly of an attempt to perpetuate all the abuses consequent upon imitations of Classic architecture, have yet not had the boldness to preserve the true style as far as legitimately they might. And, first, we have failed in convincing the world in general that in a thorough Pointed building we may have at the least as much comfort as in any other; we have attempted too much to imitate old arrangements of windows, and the like, upon the mistaken assumption that in yielding these we should be yielding the whole principles of our favourite style. But is it so? And is it not possible to devise some means in the case of windows, for instance, by which we may combine modern comfort with true principles of construction and good effect in design?

I think we may and without very great difficulty.

I dismiss the ordinary plan, which we all know from its common introduction in the mullioned windows of many of the colleges here, as being really a sham and as having almost all the defects of which people generally complain. But there is a large class of old windows used in domestic buildings of which very little, if any, notice has been taken, and which, nevertheless, seem to point at one very ready way of escaping from the difficulty.

I refer to windows in which the tracery and arch are supported by circular shafts behind, and independent of which the window-frames must have existed. I have never been able to discover any trace of any old window-frame fitted to such a window, though I believe that examples do exist, and that in a recent German work one has been figured, but in all probability they were casements in wooden frames. The advantage of such a class of windows is easily seen and will be at once appreciated. In the external elevation they have the same appearance of strength that our ordinary mullioned windows have, and avoid the weakness of effect which large unbroken window openings always have. Great play of light and shade also is afforded, and finally the window-frame may, in such a window, be as it ought, perfectly independent of the fabric. It may be either a sash or a casement (for I may remark that our national prejudice in favour of sash windows does not prove that they are better than good casements), but whichever are required, such a window allows their introduction without any difficulty.

Internally there would be no difficulty. The window might either be finished with a single rear arch of masonry upon the same plan as in those beautiful and well-known windows in the Bishop's Palace at Wells, or if necessary—and I confess that unless the stone is to be properly painted in rich diaper of colour I prefer this for comfort—with wood ornamented with painting and panelling. In this way sashes are not only admissible, but the natural way of filling up windows.

Another plan which I have tried is the use of a bold Pointed arch over the window opening. The opening itself square-headed and the space between the head of the window and the arch filled in with ornamental and coloured tiles. This plan has the disadvantage of presenting openings for windows so large as to have an effect of weakness, and this must be remedied by the boldness and decision of the arch of construction over the window. There is again a class of window very frequently met with both in England and abroad, viz. those having square-headed lights with arches of construction above them, very decidedly domestic in their character and very practically useful, whilst at the same time they are strong in construction and exhibit that construction fully. Examples are numerous; I may mention the Archbishop's Palace at Rouen, and the Mote House, Ightham, Kent, among others.

In the arrangement of windows then I think that no reason exists against some modification or adaptation to meet our wants.

In that of doors no such adaptation seems to be required. The difficulty does not exist, and the woodwork of a door framed precisely on old principles may be moulded, carved and finished with at least as much elegance and finish as in any other way.

Nor do I know any other difficulty of construction which

need be a difficulty or stumbling-block in our way. But when we have cleared away the first difficulties there remains for consideration the necessity for recurring to proper principles in ornamentation to a much greater extent than we are accustomed to see practised. You go into a well-furnished room in a nineteenth-century house and you find half of its effect to be dependent upon heavy, indefensible plaster cornices and moulded ceilings. Now for these there is no defence. The proper office of plaster is the covering of plain surfaces of walls and perhaps of ceilings: never, I think, the manufacture of mouldings as in cornices and the like. There is a degree less of unreality in its use in a room than there is in a church, because in the one it is less absolutely, perhaps, an imitation of stonework than in the other; in either case, however, it is so in a degree, and has the further disadvantage of being very temporary and perishable in its nature. A cornice in a room ought to be, as in a church, the moulded front of the wooden plate upon which the timbers rest. It may, of course, be carved and moulded to any extent. And then the proper substitute for carved ceilings are those in which either the rafters moulded and carved show themselves, or are boarded on the under side.

As to the decoration of a room constructed thus I may observe that there need be no limit as to its beauty and elegance. I believe that I speak within the truth when I say that in the Middle Ages the furniture of the domestic apartments of the household was, as a rule, as warm and elegant as our own ever is. No one, I think, can have examined ancient illuminated manuscripts to any extent without being struck with this. Walls hung with rich and curiously coloured hangings, in tissues, stuffs, or leather—or partially panelled in dark wood, partially painted in gay devices—windows carefully finished and warmly defended by hanging curtains, carpets of rich and sometimes Eastern-looking patterns, chairs, bookcases, tables, vessels for drinking, vases and the like, all designed with some reference to one general principle. I have not time now to instance examples, but I have seen them in great variety and know no course of study which seems to offer more practical information as to the domestic manners and furniture of our ancestors than they do.

I have many curious notes derived from these sources. Examples of such furniture as chairs, cushions, steel mirrors, tables, beds and bedroom furniture are very common.

In the Roman de la Rose, one of the most beautiful manuscripts in the British Museum, I have noted a metal fountain of exquisite design in one folio—iron railings on each side of steps leading up to the door of a house in another—just the subjects which one never finds still existing.

Again, constant examples of chairs with book-rests, rising in the most approved manner from the arms; in one place a wooden work frame, at which some predecessor of those good ladies, who in these days work at similar frames, plies her task; in the same manuscript a remarkable drawing of a clock, standing upon a post at a church door, striking upon a bell and worked by two weights; in other places, circular dumb waiters, as we should call them, are drawn, and presses for books, contrived with most crafty closets and desks, whereat patient students con over their books; in another I have a representation of what seems to have been the prototype of that most modern piece of drawing-room furniture, a Davenport.

I have been tedious on this point, but I have been so that it may show you how very many accurate representations of the furniture and fittings of old houses we still have, which prove beyond any manner of doubt that there was a great amount of comfort in Medieval houses combined with a degree of beauty and elegance of which their present state can of course give but a very small idea.

And all this is not in vain, for I believe it to be just as necessary that an architect should know what the furniture of a house is to be, as that his eye should superintend every decoration in colour on wall, or window, or floor of a church, and does any one know anything about the ordinary furniture of modern houses, and not recognise the wretched principles upon which it is generally designed?

In Mr. Pugin we lost an artist who in this, as in many other branches of his art, was very pre-eminent, as all who have seen the furniture, tables, chairs, curtains, wall-papers and the like, manufactured from his designs, will be ready to admit. Before his decease he had, indeed, proved that furniture, to be in keeping with Pointed architecture, need not be clumsy or awkward, but would naturally be, if good, as convenient and far more artistically beautiful than our ordinary modern household furniture, and you will remember that all his designs in this branch of his profession were very decidedly marked by their extreme reality and truthfulness. They were not Gothic certainly, in the ordinary cabinetmakers' sense; that is to say his chairs were constructed without the assistance of pointed arches, and his tables did not depend upon crockets, finial and flying buttresses for all their character, but they were real, simple and properly constructional provisions for certain

wants, with no more material consumed in their construction than was necessary for their solidity, and no sham or incongruous ornaments. In fact, like a great artist, he had realised the necessities of his art, and his genius gave a dignity to works which to some might have appeared beneath the notice of a professor of so glorious an art as his.

But to return for an instant to the question of illuminated MSS. A distinguished archæologist recommended me strongly some years back to take any opportunity that occurred for the examination of illuminated manuscripts. And persuaded as I now am of their value in aiding all ecclesiological researches, I cannot do better than give the same advice to any among the members of our Society who are able to devote time to the examination of those to which access may so easily be obtained here.

And now, having considered the general question of a revival of Pointed domestic architecture, let me say somewhat as to the degree to which designs are affected under varying circumstances.

Now, perhaps, to most of us no greater difficulty can present itself than would be the necessity to accommodate our architecture to every want of this nineteenth and most exigent of centuries, as, for instance, in the attempt to provide a substitute for our present street architecture. But unless we are able to meet such a difficulty I fear we must be content to allow that our style is one which must for ever be as it now is, very limited in its application, and this I for one, and I hope, all the members of this Society, are not likely to feel content to allow.

There is a school erected in Endell Street, Long Acre, which seems to me almost more than any other modern building I know to satisfy the wants of street architecture, and which therefore is well worth some description.

Its lower storey consists of an arcade of Pointed arches of bold construction, within which in a recessed wall the windows are placed. The upper storey is a very long arcade of Pointed arches, not all of which I think are pierced.* The elements of the design are very simple. You get at once a decided impression of the value of the Pointed arch as a feature in construction, and its use evidently prevents no necessary adaptation to modern wants. In a long row of shops, for instance, each shop front would be comprised under one of these arches, and the melancholy air which all modern shops have of being supported entirely upon plate-glass would be avoided without any loss of window space. In the upper storeys the continuous lines of arcades would be very grand indeed if prolonged to any length. Their regularity would be their greatest charm, for, as I need scarcely observe, our forefathers never courted irregularity for its own sake, but only for the sake of convenience, and where they could repeat a similar member for a similar purpose they always gladly seized the opportunity.

The irregularity of the streets in ancient cities is the result simply of the fact that as a rule one house was built after another. Each by its owner, and not as they are now, 50 or 100 by one man.

But I think I can give you one example of considerable beauty, in confirmation of this opinion, in the case of some old houses at Troyes, of which I have a sketch, the great beauty of which arose very much from the way in which the same simple features were repeated one after another in a long and unbroken succession. These houses stand on the north side of the cathedral, and were evidently built at the same time and by the same man. They are now, however, being rapidly pulled down.

The row of houses in the High Street at Winchester, with a covered way under them, are another example of the same kind.

Of course I need scarcely say that the circumstances which affect domestic buildings differ so widely that it is impossible to do more than lay down some general rules. Each building is so far good which avails itself of, and provides simply and naturally for, all the necessities of the case, as, for instance, varying levels of ground and the like. Then, again, though one would be disposed as a general rule to insist upon considerable height of wall in a town, one would advise just the contrary in the country, and for a plain practical reason that in the one case the land is so much more valuable than in the other that it is necessary to make use of it. The foreign town architecture will come to the recollection of all who know it; or ugly as the houses are in such places as Wurzburg, Bamberg and the like they leave a certain impression of grandeur on one's mind by their great height, and not less by the wonderful steepness and pitch of their roofs.

* The idea of this school seems to me to have been taken from a very fine Pointed bridge at Pavia. Such a mode of adaptation is, of course, generally to be condemned; but in this case our criticisms are disarmed, because the design and arrangements of the building seem to satisfy the wants of its situation and purpose.

A better example of the same kind of merit in a building of the very best period is the sketch of a house at Nuremberg.

And in the country a picturesque and irregular grouping—which is generally rather out of place in a town—becomes admirable as being suited to the irregularity of all nature's works, but there specially as a rule it is an advantage to have buildings as much grouped together as they conveniently can be. And so I have often contended that on this, independently of other and higher grounds, it would be a great advantage to see our various parochial buildings, as, *e.g.* schools and parsonages, brought together that so they might form a more imposing mass.

In conclusion, I cannot forbear this opportunity of making a very few short remarks upon the choice of a style in our domestic architecture. I do so because, well acquainted as we all are with the ancient examples which so plentifully remain to us in this city, we are thereby perhaps even more likely to be in error. For in Oxford we have scarcely any remains of domestic work of earlier date than the fifteenth century. We are, therefore, so far without models in that style which has now I believe by universal consent come to be considered the most perfect of all Christian styles.

We must, therefore, in our search for ancient teaching leave our universities and see how far the domestic buildings of our abbeys and old houses and the continental domestic work give us help in what we want.

Most undoubtedly such a collection of buildings as those of Fountains Abbey would make all the fifteenth-century colleges look very poor by comparison. The exceeding beauty of the detail, the convenience of the whole arrangement, and the magnificence of some parts which in later buildings are forgotten are surprising in the very highest degree.

I take Fountains as an example because it is, considering all things, wonderfully perfect, and all its parts are of exceeding beauty. Can anyone who has ever been in that ambulatory—still, though damp and neglected, and trodden only by the feet of the occasional sightseer, as nearly as possible perfect in all its parts—can anyone, I say, ever forget the impression which it makes? Picture to yourselves an immensely long spacious parallelogram, about 300 feet in length by 40 feet in width, divided down its centre by a row of columns and arches, from which springs the simplest and sweetest of groining, giving by its infinitely drawn-out length a marvellous air of space and grandeur, and you may form some idea of its magnificence. Indeed, that ambulatory is as well worth a pilgrimage from any far-off place as any one thing I ever saw.

Lanercost Priory has another of these ambulatories, much smaller, but very beautiful, though, sad to say, very rapidly falling to ruin, the old dormitory above it being now turned into a flower garden and receiving all the rains of heaven without any protection save from the rank trees, which are sprouting up and thrusting to pieces the poor old venerable walls. In fact, the early work in domestic buildings, just as much as in churches, is as far superior to the later work as anything can be.

There is a consummate skill, too, evidenced by the earlier artists in the natural treatment of irregular parts of buildings, to which the later artists can lay no claim. I cannot here forbear to make some mention of the domestic buildings at Easby Abbey. The exceeding simplicity and sweetness of this is quite touching—I hardly know what other word so well expresses its character—and evidently most truthful. So, too, their gateways were far before the later type in real artistic treatment. That at Easby Abbey must again be mentioned as showing wherein lies the difference. Keeper's Hospital, Durham, has another most excellent example, and the gateway of the abbey of Ardenne, near Caen, is a third.

But these are all very early types. If you would know, then, what the fourteenth century could do, you may see it in that glorious gateway at Kirkham, beautiful in its "calm decay," or in that most perfect of all such buildings, the great gateway of St. Augustine's.

Then, again, if rooms are wanted over cloisters, let me refer to the old cloister quadrangle at Constance, which, when complete, must have been well-nigh perfect in effect, and, at the same time, in all its arrangements most simple.

And, in further illustration of my position, I may give the Middle-Pointed portion of the old Rathhaus, at Nuremberg, or the still finer Middle-Pointed work in that at Ratisbon and the lovely bay window and fountain at Nuremberg as convincing proofs of its truth. Proofs, however, it may be said, are not wanted; the thing is notorious. So indeed it is to some of us who have studied the matter, but yet it is so notorious that the world in general imagines the Third-Pointed to be the only style allowable for domestic work that it is very necessary to take every opportunity of diligently combating the idea. In Oxford itself what has been yet done to show the contrary? Absolutely nothing. Even Mr. Pugin, in his designs for rebuilding Balliol, was guilty of giving way to this popular idea, though I do not for one instant doubt that had

he reconsidered the subject in later years he would have shown how much better a design in the real style would be, and this he proved by its adoption for the new buildings at Maynooth.

Nor were the fourteenth-century men less able to design features of utility so that they might also be features of beauty than their successors, and in the treatment of simply decorative features they were always pre-eminent.

I suppose that the popular misconception on the subject is principally owing to the fact that in all the books of "authorities" men have confined themselves almost entirely to the illustration of the Third-Pointed domestic work of the country to the entire neglect of the earlier work, for really, with the exception of some of the buildings in that most delightful of all English cities—Wells—I hardly know where one is to look for any published examples of the style. And yet there are many most magnificent remains. The Mote House, Ightham; the old house at Northborough; the Hall at Mayfield; the old buildings at Ely; the gateways at Kirkham, at Norwich; the White Friars Monastery at Coventry; the Episcopal gateway, &c., at Peterborough; the house at Longthorpe; Easby, Fountains, Rievaulx, Netley and Beaulieu abbeys; the castles at Winchester and Aydon, and such bits as the gable of a house at Beauvais figured in the appendix to Mr. Hudson Turner's most valuable work on domestic architecture—are all proofs that for the greatest excellence we must refer to the earlier styles.

And if there are portions of their work in which the fifteenth-century men particularly excel, what then? Are we not able to adopt and use them with our fourteenth-century style? Certainly we are, for there is absolutely nothing which is really convenient and useful which ought not to be made—as it is capable of being made—also ornamental. For it is in this precisely that is to be seen the distinction between the true artist and the mere copyist. The latter would refuse to do anything useful because he would find no precedent for it; the former would make his work by its adaptation of the style to the difficulties of the case, a precedent, if one be needed, for his timid successors.

In conclusion I must repeat an apology—perhaps too often made here—for the imperfect and hasty way in which so large a subject has been treated. My apology must be the shortness of my time and the press of other avocations. But I cannot but hope that I may have been able to show, first, that in proposing a thorough return to old principles of design in domestic buildings we do not propose or hope to do so without reference to modern ideas of comfort and convenience; these I have shown that our ancestors possessed to a greater extent than some people think. Then, after some remarks upon some varieties of domestic buildings, I attempted to show, and I hope with success, that we must look to the adoption of a style of architecture earlier than that commonly adopted if we wish to produce really noble buildings.

And this last is the main point, and it is a point to which I hope to see the attention of our Society directed, for it is one depending upon and involved in precisely the same principles which, I believe, we now invariably recommend for adoption in the case of all ecclesiastical edifices.

SCHOOL OF ART AND SCIENCE, WESTON-SUPER-MARE.

THE building of which we gave illustrations last week, from a photograph taken by Mr. E. Y. Poole, of Weston-super-Mare, is Renaissance in style. The front has moulded cornices, sills, strings, copings, pediments, &c., pilasters enriched with faience panels, moulded bases and elaborately-carved caps. The frieze of the entablature is enriched with faience panels. The central gable has a festoon of flowers and fruit; there are also festoons to the heads of the middle ground floor windows of the bays. The panels of the pilaster pedestals are also faience, the intermediate panels being richly carved. The arches, bed moulds over caps and sill moulds are carved with echinus, or egg-and-tongue ornament. The spandrels of the arch to porch are richly carved with Renaissance carving. Two large bay windows give relief to the front, and the porch on the ground floor only gives a break to the vertical lines, the top forming a balcony. The gables of the building are ornamented with moulded and worked finials with balls and curved copings. The parapets have moulded balusters. The ground floor is built with local limestone, with freestone dressings, to give massiveness to the supporting storey. All above this is built of freestone with niches for sculpture, backed with good solid brickwork. The roof is covered with slates fastened with Harvey's system of screws and washers. The gutters and flats are of stout lead. Inside.—The ground floor is laid with wood-block flooring on cement concrete. The first floor has massive steel girders with smaller steel joists between, having a fireproof floor of cement concrete, on which is laid wood-block flooring. The second or top floor is formed with strong wood joists and flooring board. Arrangement.—On the ground floor is a large hall 57 feet 6 inches by 17 feet and

15 feet high, having two bay windows, each 12 feet by 5 feet, and this hall is entered by a porch 12 feet by 5 feet. On the south or left-hand side of the hall is the staircase (lighted by windows) to the art schools, 5 feet wide, arcaded towards the hall. Opposite the entrance doors to the hall are two arches (old). These archways lead to the science lecture-room, trades technical classrooms, committee-room, lavatories and offices. The large hall, it may be stated, can be used as a permanent art gallery or for exhibitions from time to time. On the first floor is a carving-room 28 feet 6 inches by 17 feet and 12 feet high, having one bay window, 12 feet by 5 feet, and two flat windows. Next to this is the life-room, for studies from the life, 15 feet 6 inches by 17 feet, having one bay window 12 feet by 5 feet. The master's-room is on the north side, 17 feet by 12 feet, and is lighted by a flat window 8 feet by 8 feet. Each of these rooms is also 12 feet high. A corridor communicates with these rooms, and also with the present two large art rooms (elementary and advanced); also with the lavatories and offices. There is also a back staircase to this floor and to the top floor. On the second or top floor is a cookery classroom 30 feet by 17 feet, lighted by two flat windows, having a coved ceiling 15 feet high in the middle. The latest cooking ranges will be fitted up in this room for lectures. Next to this is a scullery 13 feet 6 inches by 9 feet 6 inches, also lavatory and offices. At the north and south ends of this floor are the caretaker's apartments. All these rooms are entered from the upper corridor.

The first portion of the building was commenced in the year 1892, consisting of elementary-room and advanced room, each 60 feet by 20 feet; science lecture-room, 35½ feet by 20 feet; chemical laboratory, 23½ feet by 20 feet, and three trade technical rooms, each 20 feet by 15 feet; committee-room, 13½ feet by 12 feet, with cloakrooms, lavatories, &c. This contract was carried out by Messrs. Theo. Palmer & Son, under Messrs. Price & Wooler, the architects, at a cost of about 1,600/.

The second portion, completing the building, was carried out by Mr. Henry W. Pollard, builder and contractor, of Bridgwater, under Mr. Hans F. Price, architect, of Waterloo Street, at a cost of about 2,000/. The carving was executed by Mr. J. P. Steele, of Kingsdown, Bristol.

CHESTER NEW BATHS.

THE frontage of the new baths at Chester, which were formally opened on the 25th ult., is particularly ornamental and attractive. The windows are faced with stone, and the gables are in the old black-and-white style characteristic of Chester, with the woodwork becomingly ornamented with carving. The principal features of the baths after the architectural characteristics of the exterior, and the vast improvement effected in the neighbourhood by the approaches, are the two splendid plunge-baths, which will be a standing reproach to citizens of Chester who neglect to acquire the art of swimming. The larger of the two baths is the popular bath, or the second-class bath, and this, which is only available for members of the male sex, is 75 feet long and 35 feet wide, with a depth of water varying from 3 feet 6 inches at one end to 7 feet at the other, and surrounded by dressing compartments, and up above a gallery, in which at water-polo and swimming matches there will be accommodation for spectators. When it is not in use as a bath the fittings can be removed, and this bath can be adapted to a gymnasium or for any other purpose. The first-class plunge-bath is rather smaller, being 60 feet by 30 feet, and so many times a week this will be reserved for ladies in the same way that the floating baths have been reserved. The arrangements here, as in the other bath, are excellent, there being guard-rails and sprays for cleaning purposes, and a splendid supply of light from the top lanterns surmounting the roof. Both baths are lined with white glazed bricks. The other departments of the new buildings may not be so generally interesting as the swimming-baths, but there are many who will be glad to hear of the facilities for taking an ordinary slipper or vapour bath, which are excellent. There are seven second-class slippers and one vapour, three men's first-class slippers and one vapour, and four women's slipper-baths, with waiting-rooms and separate entrances for the sexes. Besides the actual bathing area there are a great many incidental departments, including laundry, ironing-room, fitting-shop with up-to-date machinery, and a large boiler-house with passage around the whole of the baths below ground. Then there are the offices and the house of the superintendent—a convenient little dwelling, containing kitchen, scullery, sitting-room and three bedrooms, and lighted, like the building all through, with electricity. The water used in the baths is taken from the city mains, and heated to what temperature may be required. The baths themselves are heated throughout with steam. The cost of the baths, which are built in stone and Ruabon brick, was estimated at 11,000/., but this sum has been exceeded by about 300/., spent on extras. The architects for the baths have been Messrs. Douglas & Minshull, and the contractor Mr. W. W. Freeman.

AUSTRALIAN COMMEMORATIVE MEMORIALS.

A CORRESPONDENT of the *Bendigo Advertiser* has had an interview with Mr. H. Desbrow Annear, architect, of Melbourne. He was engaged in decorating Melbourne during the visit of their Royal Highnesses the Duke and Duchess of York, in connection with the Commonwealth celebrations, and designed and supervised the erection of the chief feature in the metropolitan decorations—the Classic arch upon Princes Bridge.

"One of the few things the ducal visit has been responsible for," remarked Mr. Annear, "has been to thoroughly and seriously awaken the authorities of the capital of our State to the absolute necessity of its æsthetic treatment. Prior to the ducal visit, sanitation, lighting and the more material matters principally occupied attention. It was only the necessity for improvements that made the Government alive to the fact of the great opportunities presented. When I was first commissioned to design a triumphal arch, my instructions were that it would probably be placed near the Homœopathic Hospital, on the St. Kilda Road, which point is the boundary of the city, and it was only when I began to go into the subject that I suggested Princes Bridge as the proper site, and showed how, by the reflection in the water and other effects, the dignity of the structure could be enhanced. The city arch was the only attempt made to portray something of the effect that can be produced by architectural and permanent structure. The upholstery and general flimsiness of the other decorations honestly admitted that they were only intended to be temporary in nature. There is a feeling that the arch should be made permanent, but of course that really is dependent upon ways and means, and whether the Government authorities are justified in spending so large a sum of money as it is estimated to cost. I am perfectly convinced that the most economical way, as well as the most effective, to have the structure made permanent, would be to place it where it now stands. The abutments on the northern end of the bridge could be capable of carrying a permanent arch in stone, and therefore very little money would have to be spent in foundations. Four heavy semicircular arches built between these abutments would carry the weight easily."

Have you thought of any scheme, speaking generally, to give expression to the idea?

"I think anything that is done should be of a federal character—to make the arch a monument perpetuating the establishment of the Commonwealth. It would be a grand thing if in its construction, always providing that the idea will materialise, all the beautiful stones of the various colonies—marble from South Australia, freestone from New South Wales, granites and basalts from Victoria, and the fine porphyries from Queensland—were utilised. The public has no knowledge of the riches in beautiful building stones we possess in Australia. Melbourne prior to the use of granite had a poverty of picturesque building stones in its works of architecture."

"As far as the design of the arch is concerned, it has been repeatedly remarked that it is a copy of this and the other. As a matter of fact, it is not based or copied from any. There are certain first principles upon which you must proceed in designing classic monuments of this character, which give to the initiated and unobservant an apparent likeness. A good parallel is the horse. Nature made the horse and has never found any reason to alter it, and to the unobservant all horses are the same, but a breeder will tell you different. And the triumphal arch is purely a Roman feature, standing absolutely alone. In the history of the world no other nation used it. Imperial Rome in its period of greatest beauty contained thirty-six triumphal arches. Of these we only have the remains of three, and no evidence at all as to what the others were like. As with our law, our architecture is absolutely based upon Roman prototypes. A triumphal arch would be perhaps the best way to perpetuate many things. In Rome, as you know, they were covered with tablets, and historical events subsequent to their erection were inscribed thereon."

"Another obvious and important fact—anyone approaching the city from the south must have noticed it—is that the costly and beautiful bridge spanning the Yarra is, as you cross it, so close a broad street that you are not made aware of its importance and value. Such a structure as the arch immediately makes all that prominent. If it is decided to make the arch permanent in the manner suggested, it could be done for £50,000."

"If you study the trend of architectural development in the great centres of the world you will find that the decorative value of all structures is becoming a serious matter. The early Victorian period rather devoted itself to utilitarian, engineering and scientific tour de force. Now the æsthetic value of permanent structures and the art decoration of the work is receiving its proper attention. The States are just beginning to be realized of the value of better artistic development, and, like the Romans, I am inclined to think there's a good time coming."

"It is felt that Melbourne being the city where the Commonwealth Parliament was opened, it would be fitting that its inhabitants should bestir themselves in the matter of beautification. Victoria was also the first State visited by the royal party. It is a unique fact in history that no heir apparent to an empire ever travelled so far before over the world in regal state. The event stands alone. The great marches of Alexander and Napoleon were only suburban jaunts in comparison. If we could only look at it in retrospect from the imaginary history of the future we would be struck with its immense significance. How artistic expression will be given to it is a matter of State, municipal and personal concern."

"Were it decided to have a triumphal arch a large portion of it would be left for inscriptions in bas-reliefs. Australia is now on the eve of taking her place in the Empire. The recent war has brought that home to us more closely than ever. It was thought that some monument would be erected to the late Queen's memory, and, of course, a triumphal arch would be inappropriate for that. It would be distinctly questionable taste. It might be built, however, to commemorate the progress in arts and sciences during her reign. It could also be raised as a memorial to our South African soldiers, and the names of Australians who fell could be perpetuated on the piers. The death of these heroes was a triumph, 'for the sorrow at the death of a soldier is drowned in the pride of his fall.'"

"I cannot help being moved to admiration," said Mr. Annear, as he paused in his walk opposite the conservatory, "by what has been done in Bendigo in the way of reserves. Rosalind Park is one of the most beautiful spots in Victorian cities. The people locally, I note by the press, have also caught the spirit of the times, and are recognising the necessity of having sculptured works about Bendigo. I think they would have been wise in obtaining designs for a comprehensive scheme that would serve as the basis for all future enrichment and beautification of the city. This could be slowly evolved, and it would not be expected to be strictly adhered to. It would be valuable as something to keep before the public-minded citizens, and would always be an incentive to further improvement. Individual efforts scattered about over a long period of years are liable to compete with each other, and destroy the end sought. Ballarat, for instance, has gone a certain distance without any scheme at all, and individual statues are fighting with each other. That side seems to have been absolutely lost sight of in considering the Queen's memorial here. You have the lesson of Ballarat, and want to avoid its mistakes. Let me give you an illustration of what I mean. The Queen's memorial, which is to be a portrait statue of Her late Majesty, could be placed upon a sub-base so designed that it could be enriched with bas-relief, and built so that a beautifying canopy could be subsequently added. The whole could be so placed that in after time it could be surrounded by statues illustrating industry, art, charity, power, dignity, and even statues of worthy public benefactors. One subject that would lend itself to fine treatment, on a panel, or better, by a separate group, would be one giving expression to the discovery of gold and the early characteristics of the Bendigo field. As a smaller portion of the scheme the Queen's statue, for which I see an admirable design has been accepted, would first be undertaken. The rest would be done with the progress of time, extending far into the future. This is the way all the great cities of the world have been trending. Paris has been so treated, and many others on the Continent, while London is only just awakening to the artistic advantages of such a method. Just a few days ago we had the news that Brock, as sculptor, and Aston Webb, as architect, were designing the Queen's Memorial in London, so that it should leave scope for its being more than a mere monument. We British as a nation are only on the threshold of anything of this kind. If there is any profit from the exhibition I understand it is to be devoted to the beautifying of the 'golden mile' around Bendigo, and the possibilities of effective outlay of money in this direction are great indeed. You have wealth in Bendigo amongst your citizens, and something comprehensive—some high aim—would encourage them to give in this as well as in succeeding generations."

Glancing at Howard Place, Mr. Annear exclaimed, "Ah, there is your site for a scheme such as I have roughly outlined. It is in the heart of the city, and closely associated with the best architecture, and provided with a background of nature's own beauties. I am inclined to think that the greatest Bendigonian is the man who planted the first tree in your streets. I am sorry to see that those trees do not receive the attention they deserve. I feel for old Bendigo, and the subject of enhancing its beauty interests me deeply, for I am a native."

A Crannog, or pile dwelling, supposed to be of the Roman period, has been found on the south side of the river Clyde, near Dumbarton.

FORTINGALL CHURCH.

THE old church at Fortingall, N.B., which is at present being demolished to make room for a new church, dates, says the *Dundee Advertiser*, from pre-Reformation times, but how far back it actually goes has not yet been definitely ascertained. The original structure is supposed to have been dedicated to St. Cedd, a Saxon saint, who was buried to the east of the present churchyard, a flat stone in the roadway still marking the spot. There is an old archway (said to be part of the original edifice, dating back to the seventh century) at the east end of the present building, and close to the doorway at the west end is a large flat stone which covers an irregularly-shaped basin or font, supposed to date from pre-Reformation times. As the work of demolition proceeds a careful watch will be kept to ascertain whether any historical or antiquarian relics can be discovered. The building has now been unroofed, and the timber forming the joists is in a thorough state of preservation. The church was renovated in the early part of last century, when it was probably reroofed. Previous to that the gallery was reached by an outside stair at either end of the building. In 1851 some alterations were made; the Session House was then enlarged to its present dimensions, and part of the wall on the north side was renewed. Hence the state of preservation of that part compared with the remainder at once strikes the observer.

One interesting relic, believed to date back to the foundation of Cedd's church, is the old hand bell, which remains in the custody of the minister. According to the analysis of Mr. W. Irison Macadam, F.C.S., it is composed thus:—Iron, 49·11; copper, 47·35; and tin, 3·51. It is oblong in shape and about 8 inches in height. In appearance it is composed of an inner layer of iron coated on both surfaces with bronze. The handle on the top is of iron. The tongue is now gone, but that loss must be of comparative recent date, for a few old residents can remember that when at school it was counted an amusing as well as daring feat to creep in by a hole in the wall near the archway, already noticed, and ring the bell, which was then kept in the precentor's desk. There are other two bells of somewhat similar pattern in the district—the Kerriemore and Balnahanait bells in Glenlyon.

The present belfry has now been taken down, and the inscription on the bell is "Johannes Specht, Rotterdam. A.O. 1765." On the stones composing the belfry the date marked is 1768. The disparity in dates is said to have been caused by some dispute with the parish of Dull regarding the ownership of the bell. The bell is in a splendid state of preservation, and whatever the nature of its composition it has successfully resisted the action of the weather for nearly 150 years.

The old yew tree beside the church, said to be the oldest tree in Europe, still stands wonderfully fresh and green, although its companion in many a beauteous summer day and many a tempestuous winter eve will soon disappear for ever. Some time ago, after due consideration, the heritors resolved to erect a new church. Plans have been submitted and approved, contracts accepted and the work will proceed forthwith. Sir Donald Currie, on whom will devolve the chief outlay, is taking a very great interest in the matter, and that is a sufficient guarantee that the new structure will be at once convenient, comfortable and ornamental.

ST. GILES'S, CRIPPLEGATE.

UPON the union of the benefice of St. Bartholomew, Moor Lane, with that of St. Giles, Cripplegate, says the *City Press*, it was decided to remove to the latter edifice a number of historic appointments which formed an interesting feature of the first-named church. Though itself a comparatively modern edifice, St. Bartholomew's, Moor Lane, contained not a few valuable relics which were recovered from the church of St. Bartholomew-by-the-Exchange at the time of the Great Fire. The original church was rebuilt near the Bank in 1438, destroyed by the historic conflagration and replaced by Wren. Then, the historian informs us, "the materials of the old church were sold by auction in 1841 for 483*l.* 15*s.*, the south wall and a chapel being reserved to be built into the Sun Fire Office, as was also some of the carved masonry, the old pulpit, the organ and other woodwork, which were preserved in a copy of the old tower and church erected in 1849-50 by Professor C. R. Cockerell, R.A., in Moor Lane." When it was decided that the Moor Lane edifice should at last disappear for ever, the authorities of Cripplegate, as readers are aware, obtained a faculty authorising the removal of the several interesting relics to St. Giles's. For some months past the work of re-erection has been in progress by Messrs. W. H. Lascelles & Co., 121 Bunhill Row, under the direction of Mr. F. W. Jackson, the clerk of works, and now it is all but complete. The result of the improvement has been to provide an ante-chapel at St. Giles's to the north of the chancel. Here the reredos from Moor Lane has been placed. It is composed

of exquisitely carved wood, attributed to Gibbons, and contains two coloured panels representing Moses and Aaron. The communion-table is of elegantly figured marble. On the wall to the north of the reredos has been fixed another beautiful specimen of carving, in which are apertures for two panels. The reading-desk has also been removed. The tiled floor of this former chancel has been relaid, and the partition rails have been made from the choir-stalls in use at St. Bartholomew's. The difficult task of removal has been carefully carried out, and the result is to add in no small degree to the beauty of Cripplegate's parish church. When "the four shoppes" disappeared the Great Fire commemoration window is also to be fitted up at St. Giles's. Apropos of the improvements, it is interesting to note that the same firm have had in hand the re-erection of a licensed house adjoining the church. In order to establish a sound foundation it was necessary to burrow some 27 feet below the chancel of St. Giles's. This necessitated the temporary removal of a large number of coffins, and, judging from the spot at which the remains of Milton are believed to rest, it is not improbable that the body of the poet was among those thus disturbed. It is significant that the whole of the coffins bore inscriptions with one exception, and that in this instance the body was enclosed in two shells. The remains have since been restored to their original positions. In the course of the excavations the workmen came across a running stream of water.

TESSERÆ.

Ancient Wooden Churches in Norway.

THE style of northern wood architecture seems a combination of several originals. The element of Latin Christian architecture is not easily to be mistaken in various members, as the squared abacuses of the capitals. In other ornamental details the designs seem to point to some yet older northern patterns. In the plans, however, and general dispositions of these churches Byzantine ideas may be traced, which is to be accounted for sufficiently by the passages of the Wäringers through Russia to and from Constantinople. These various styles are to be made out as much by the materials of parts of the buildings, viz. brick and rubble, as by the different details which distinguish them. This style is one quite unique and peculiar to the remote north, for though we have certain knowledge that many of the early churches of Germany were built of wood, we cannot trace nor ascertain their resemblance to these. The greater number, indeed, of these churches have suffered more or less alteration from their original forms by the ravages of time, by repairs or by enlargements. But still in the more remote districts the little care which was taken for these so-called improvements has contributed somewhat to the preservation of their ancient character. Although the church at Urnes is not so singular in appearance as those of Borgund and Hitterdal, and although it has moreover lost its original form in some measure by additions, it is nevertheless worthy of attention from the number of fragments of the original building which yet remain, both in the interior and exterior. From these, indeed, it is clearly to be seen that the whole church was once decorated similarly with the one shaft and timbers which remain. From this we are led to conclude that these churches were generally not only ornamented in this manner at the doors and door-posts, but also over the whole exterior, and that these are all that is left by repeated renewal and patchings with ordinary timber. Interiorly also it has suffered much from repairs and alterations, which date from the sixteenth and seventeenth centuries. Still the pillars and their capitals have been preserved, and with the general plan of the building certainly point to a Byzantine original. It appears to have been a generally acknowledged principle in the early part of the Middle Ages to admit the most complete variety and irregularity of detail, this being observable both in the round and pointed styles. In accordance with this we find even in these churches, that the mouldings and slender door shafts do not exactly correspond in size. We can hardly think that this was the result either of carelessness or of the want of better materials. The former hypothesis would be quite a variance with the remarkable solidity and conscientious exactitude of completion displayed in the buildings of these times, as well wooden as those of stone. These irregularities may be ascribed to the mode they seem to have had of preserving and adapting carvings and other relics of yet more ancient buildings, a custom even now prevailing. All these churches are somewhat dark, the light being admitted by windows placed very near, and even in the slope of the roof. The windows were filled with stained glass in the beginning of the seventeenth, or perhaps the end of the sixteenth century, and it is painted in shades of grey, which is peculiar to that period. The darkness is further increased by the number of exterior added blind-storeys and chambers built for those who came from a distance to attend Divine service, which do not by any means add to the beauty of the churches. From this circum-

tance of the glass, and from others, this church has evidently been a great deal repaired at that time. The people of that district, however, assert that it is of very high antiquity, and mention the year 1073 as that in which it was commenced. The name of St. Lawrence and date 1663 is on the single bell of the church. The general plan of these buildings seems decidedly Christian; in all chancel and nave, in Hitterdal and Borgund a decided apse, and in all nave-aisles are to be seen. In the churches of Borgund and Urnes there is barrel-vaulting in the nave; in that of Hitterdal, however, a flat-panelled ceiling such as that of Peterborough Cathedral.

Triplet Lancet Windows.

No one will care to deny that triplet lancets may occasionally be found in other positions than at the east end. They occur not unfrequently at the ends and even at the sides of transepts, as at St. Andrew's, Histon—though this latter is a rare case, and entirely owing to a peculiarity of internal construction. At the west end, though very seldom, as at St. John Evangelist, Acconbury, Hereford (a very rich example), St. Faith's, Overbury, Worcester, and elsewhere. But in ordinary churches to triple every lancet as in the Temple Church, Bristol Cathedral, and elsewhere in very large edifices, is a mistake subversive of correct effect both within and without. But lancets comprised under a single dripstone become, properly speaking, windows of so many lights, and were often used in any position. Even with separate dripstones they sometimes partake of that character, as the singularly beautiful though late group at St. Peter's, Yaxley, Hunts. We believe the ancient architects to have had no decided reluctance to the use of a small triplet by way of variety in any position, but they scarcely ever placed two triplets together. It is by no means uncommon to find a triplet at the south-east end of the chancel or the south aisle. Of this examples occur at Great Casterton, and at All Saints, Tinwell, Rutlandshire; here another small triplet is placed in the west wall of the north aisle, and both of these are beautifully adorned with the both-moulding in the arches. We will further observe that triplets were by no means invariably used for the east end. Sometimes five lancets occur under a single label, of which very fine examples occur at St. Mary's, Etton, Northamptonshire, St. Peter's, Kempsey, Worcester, St. Andrew's, Auckland, Durham. A few examples of eastern couplets occur, as at St. Peter's and Paul's, Great Casterton, Rutland, St. Andrew's, Bedford, and All Saints, Coddington, Herefordshire; in St. Michael's, Michaelchurch, in the same county, are two single lancets in the eastern wall.

The Rewards of Artists.

Much is said about the humanising and elevating effect of art. But what empty talk is this, if the artist—if he who alone can give form, vitality and motion to this mighty instrument of civilisation, is to be regarded as the inferior of the very men whom he is to lift out of the bonds of matter and of custom, as often as they happen to possess some extrinsic advantages which he wants. We ought to try to come to a clear understanding with ourselves on this matter, and to establish a consistent theory and practice. Either, as it is now the fashion to repeat, art has an elevating and purifying effect on the morals of a country or it has not. If it has, by what process of reasoning are the depositories of so high a ministry talked of and treated, as if they moved in the society of the undistinguished and undistinguishable many on sufferance? If it has not, why all this labour to get up a taste for it among the people? We hear constant allusions to Germany and France—and with reason; but both are consistent with themselves. Art is there honoured in its ministers. The people are not told, here is a man who can create that, the mere contemplation of which will lift you above the sordid part of your nature—who carries within him the type of that beauty which has power to raise and refresh your souls; and the next moment practically taught to regard him as belonging to a class whose position and claims to respect are doubtful. It cannot be that he is degraded by receiving remuneration for his labours, for do the ministers of justice in their various degrees give their services to society gratuitously? Do the ministers of religion found their claim to the respect of mankind and to their station in society on the gratuitous character of their ministry? Why then should the ministers of art be subjected to so absurd a demand? Why should art be consigned to the half-knowledge, the half-zeal, the half-practice of a feeble dilettanteism?

Architectural Foliage.

It must be confessed that foliage excels in beauty every other ornament which the taste and ingenuity of its practitioners have applied to architecture. The freedom with which the carver could exercise his fancy without even the obligation of confining himself to the endless productions of nature tended not a little to the beauty of the patterns he executed. A cluster of leaves would admit of endless varieties, and yet all be equally admirable, though no name should be found for

them in the catalogues of the botanist. Still, however, imitations were often successfully attempted by our early artists, and it may probably be ascribed more to their disdain than their incapacity for the office of exact copyists that the resemblance comes so often no nearer the archetype than does the lean and lank lion of heraldry to the noble animal of the desert. As the proper or casual habitation of birds, animals and insects, the ancient sculptors in their imitation of trees and plants did not neglect the opportunity thus afforded of augmenting the variety and interest of their favourite species of ornament. Accordingly, we meet with birds, snakes, snails, butterflies, monkeys, squirrels, human beings and hideous monsters entangled in sport among the branches, or employed according to their respective natures in feeding on the leaves or the fruit. It may appear surprising that so much attention should have been paid to the minutiae of ornaments when little more than their general forms could be observed even by an attentive eye; but it is an indisputable fact that the greatest labour was often bestowed in forming and finishing the smallest particular of such subjects. Wherever ornaments were admitted, the fancy and labour of the carver were apparently exercised without control. While figures of the most ludicrous, and sometimes of the most disgusting, character were placed in prominent situations, the seat of a stall or the cornice of a parapet were often wrought with heads, foliage and devices of elegant form and beautiful execution, so little were order and arrangement consulted in their disposal.

Uncertificated Ability in Architecture and Engineering.

If freedom in professional matters at times be a source of evil from the facility it offers to incompetent men to rush into pursuits they are totally unacquainted with, it is also a source of good from the ease with which a man with natural genius can force his way into notice. Had it been necessary to have gone through a particular class of studies, or to have obtained a diploma from learned examiners who would most likely be wedded to the theories of the school in which they themselves were educated, such men as Wren or Mansard might have found themselves excluded from the ranks of a profession they so wonderfully adorned. Watt, Telford, Stephenson, Rennie, Jessopp, Cooke, Wheatstone were none of them regularly brought up to the profession of engineering; yet they did more to change its character, to advance its usefulness, than any men produced by polytechnic schools, schools of mines, or other organised methods of instruction. No man of genius was ever produced by the examination and diploma system. Many a man of genius is driven away from a pursuit in which he might otherwise have shone by the restraints and difficulties such a system would throw in the way of his first steps. The Institution of the Ponts et Chaussées in France drove Brunel to England. Liebig found it more easy to rise into European notice here than in his own country, notwithstanding his official position. Numerous instances may be cited of self-taught men who have started into notice—and done great good, too, in their generation—in countries where art and science are free to all the world; but the exceptions of this kind in countries where diplomas exist are so few that we may almost assert that they do not exist. The evils of restriction are, undoubtedly, worse and greater than those of competition, for an ignorant pretender soon falls to his proper level. But who can appreciate the injury to society which may arise from the exclusion of any form of genius, educated or uneducated? To secure the introduction of the marvellous inventions we owe to our system of unrestricted freedom in engineering, such as the docks, railways, locomotives, steam-engines, steam-boats, gas-lighting, electric telegraphs, &c., we would willingly run the risk of having homœopathic drains laid down and taken up again. Our loss has been merely a money loss—one we can appreciate and repair. The loss which is occasioned by cramping the energies and destroying the originality of a national mind no human being can possibly divine.

Stone Working in Egypt.

The builders of the twelfth dynasty, more ambitious than their predecessors, and authors of almost all the structures of the middle empire which we know, brought the red granite of Syene at the first cataract for their columns. Those of Bubastis and Hawara are examples. They wrought them and their sculptures in the same obdurate material with the decision and cleanness of handling which we all know, although with the sacrifice of some of the delicate detail of the earlier work. Up to this time nothing less than a monolith seems to have been thought worthy to stand as a column, but if the Usirtasens and Amenemhats of the twelfth dynasty could do their modest building in this way, the Ramessides, who bordered the river from the first cataract to the Delta with their huge constructions, could not follow it. Shafts of columns from 16 to 20 feet high for a few buildings of moderate size could be brought down to the Fayum or the Delta; but when it came to columns 40 or 50 feet high, or even 60 or 70, and in groves,

as we see them at Luxor or Karnak, this method was impracticable. The Pharaohs of the eighteenth, nineteenth and twentieth dynasties used the sandstone of the quarries above Edfu. Its facility in cutting and handling suited the scale of their buildings and the speed with which they could carry them on. They laid their shafts in drums or slices, or, as the columns grew larger, they built them up in coursed masonry. This they covered with stucco to dissemble the joints and give them a fair surface for sculpture and painting. So were built the great pillars of the temples that stand on the plain of Thebes, at Karnak, Medinet Ebu, at Karnak, at Luxor, and even the earlier work of Seti I. at Abydos. The huge central columns of the hypostyle hall at Karnak, 70 feet high and 12 thick—on the tops of whose bell capitals a hundred men might sit, we are told—are towers, and had to be built as towers are built.

The Roman Amphitheatre.

It is not quite clear whether the arena was no more than the solid ground, or whether it had an actual flooring of any kind. The latter opinion is adopted by some writers, who suppose that there must have been a souterrain or vaults, at intervals at least, if not throughout, beneath the arena, as sometimes the animals suddenly issued apparently from beneath the ground, and machinery of different kinds was raised up from below and afterwards disappeared in the same manner. That there must have been some substruction beneath the arena, in some amphitheatres at least, is evident, because the whole arena was upon particular occasions filled with water and converted into a naumachia, where vessels engaged in mimic sea-fights, or else crocodiles and other amphibious animals were made to attack each other. Nero is said to have frequently entertained the Romans with spectacles and diversions of this kind, which took place immediately after the customary games and were again succeeded by them; consequently there must have been not only an abundant supply of water, but mechanical apparatus capable of pouring it in and draining it off again very expeditiously. The arena was surrounded by a wall, distinguished by the name of podium, although such appellation perhaps rather belongs to merely the upper part of it forming the parapet or balcony before the first or lowermost seats nearest to the arena. The latter, therefore, was no more than an open oval court, surrounded by a wall about 18 feet high, measuring from the ground to the top of the parapet, a height considered necessary in order to render the spectators perfectly secure from the attacks of the wild beasts. There were four principal entrances leading into the arena; two at the ends of each axis or diameter of it, to which as many passages led directly from the exterior of the building, besides secondary ones intervening between them and communicating with the corridors beneath the seats on the podium. The wall or enclosure of the arena is supposed to have been faced with marble, more or less sumptuous, besides which there appears to have been, in some instances at least, a sort of network affixed to the top of the podium, consisting of railing, or rather open trelliswork of metal. From the mention made of this network by ancient writers, little more can now be gathered respecting it than that in the time of Nero such netting, or whatever it might have been, was adorned with gilding and amber, a circumstance that favours the idea of its having been gilt metalwork, with bosses and ornaments of the other material. As a further defence, ditches, called euripi, sometimes surrounded the arena. The term podium was also applied to the terrace or gallery itself immediately above the lower enclosure, and which was no wider than to be capable of containing two, or at the most three, ranges of movable seats or chairs. This, as being by far the best situation for distinctly viewing the sports in the arena and also more commodiously accessible than the seats higher up, was the place set apart for senators and other persons of distinction, such as the ambassadors of foreign parts; and it was here also that the emperor himself used to sit, in an elevated place called suggestus or cubiculum, and likewise the person who exhibited the games, on a place elevated like a pulpit or tribunal (editoris tribunal). The vestal virgins also appear to have had a place allotted to them in the podium. Above the podium were the gradus or seats of the other spectators.

The Tattershall Windows.

Gough, the antiquary, tells a story concerning the windows in Tattershall Church, Lincolnshire. The windows of that church are magnificent in their dimensions, and they were once filled with the richest stained glass, which disappeared from it in the following manner. Lord Exeter, not having learned the Commandments, or not understanding or totally disregarding the eighth and the tenth, employed a man of the name of Banks, of Revesby, to get possession of the glass for his lordship's use. Celerity and secrecy are essential to success in most schemes of spoliation; and as the townspeople had some sort of suspicion that their church was marked as a prey to the spoiler, and were quite disposed to obstruct the robber in his

work, Banks used such speed and took down the glass so hastily that no plan for its rearrangement could be observed; part of it, however, was put up in the chapel at Burleigh, part sent to Warwick for Lord Warwick's castle, and part, says Gough, still remains unpacked; and thus was this noble church—one of the noblest in the kingdom, one of the finest specimens of masonry in the kingdom—ruthlessly despoiled, and it was left for many, many years without any glass whatever in its magnificent windows, open to all the winds and snows and storms of very many successive winters. If this story be true, why has not restitution of these windows long since been claimed? Why should this church be thus defrauded? What right has the possessor of these windows in them?

GENERAL.

The Society of Engineers will hold their next meeting on Monday, when papers will be read on "Preliminary Investigations for Water Supply" by Mr. S. A. Holles, and on "Irrigation Works in South Africa" by Mr. J. Freebairn Stow.

Messrs. Farmer & Brindley prepared the model of the new cathedral, Westminster, of which we gave an illustration last week. This model is executed in kaurie pine, and takes to pieces so as to exhibit the whole of the interior, which is finished complete in every way.

Mr. E. L. Masqueray, who for nine years has conducted an atelier in New York on the French system, has been appointed by the Government architect as chief designer for the Louisiana Purchase Exposition at St. Louis.

The Liverpool Architectural Society will hold their first general meeting since the incorporation of the Society on Monday next. The opening address is to be delivered by Professor Simpson.

Miss F. C. Duncombe has bequeathed 500*l.* to the fabric fund of York Minster. Subject to certain life interests, half of her residuary estate has been left in trust for the same fund.

Mr. Carnegie has offered to give half of the 50,000*l.* required to complete the building fund of the Glasgow and West of Scotland Technical College if the other half is promptly subscribed.

The Donations requisite for the purchase of the Brandelhow estate, Derwentwater, have been received or promised, and the council of the National Trust has every reason to believe that by October 15 it will be in a position to carry through the scheme.

Mr. J. W. Swan, the electrician, whose name is universally known for his inventions, has received the honorary degree of D.Sc. from the University of Durham. At the same convocation Mr. Robert O. Heslop, the archaeologist, had the degree of M.A. conferred.

M. Injalbert has received the commission for the erection of a monument to the poet Gabriel Vicaire, the author of "Emaux Bressans," which is to be placed in the garden of the Luxembourg.

Mr. Robert East, who had a local reputation as an archaeologist, died at Southsea on Sunday last. He compiled the "Corporation Records."

The Foundation-stone of a new church being built in a suburb of Chichester was laid last Saturday. The church will provide accommodation for 500 people, the cost under the contract, which is in the hands of Messrs. Dove Bros., with Messrs. J. E. K. & P. Cutts, of London, as architects, being 3,500*l.*

The Art for Schools Association have removed their office from 29 Queen Street, Bloomsbury, to 46 Great Ormond Street, in the same neighbourhood.

The Royal Water-Colour Society will open on Monday at their gallery in Pall Mall East a special exhibition of the works of the late William Stott, of Oldham. The exhibition will close at the end of the first week in November.

A Farm near Gilsland, on the borders of Cumberland and Northumberland, including the well-known Roman camp of Amboglanna, was sold by auction last Saturday to Mr. Joseph Wright, of Crosby, for 8,000*l.* The Roman camp upon it is one of exceptional interest. Part of the walls of the fort and the gateways are visible, and many altars and sculptured stones have been excavated. Recent explorations prove that the vallum of the Roman wall sweeps round the south of the fort.

Mr. B. T. Batsford has sent us a guinea in aid of the fund for Mrs. Giles, the daughter of the late C. F. Richardson. We have also received some smaller sums for the same purpose.

Battle Abbey and domain, comprising one of the stately homes of England, with which is incorporated the remains of the Benedictine monastery founded by William the Conqueror A.D. 1067, on the site of the Battle of Hastings, is to be sold by auction in November.

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land as ornamental grounds. Premium of 20*l.* offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive plans for an isolation hospital. Premium of 25*l.* offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BLYTH.—Plans are invited for proposed new schools and caretaker's house at Crofton, Blyth. Schools to accommodate about 450 mixed children and about 300 infants. Mr. Henry T. Rutherford, clerk, Blyth, Northumberland.

CONTRACTS OPEN.

ARCLID.—Oct. 10.—For alterations at the workhouse at Arclid, Cheshire. Mr. Alfred Price, architect, Elworth.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

ARMLEY.—Oct. 21.—For erection of board-room and offices at Hill Top, Armley, near Leeds. Mr. Percy Robinson, architect, 72 Albion Street, Leeds.

BARKING.—Oct. 9.—For erection of an entrance-lodge, tool-house, building, and cart-shed at the recreation-ground, Longbridge Road, Barking, Essex. Mr. C. F. Dawson, surveyor, Public Offices, Barking.

BARNESLEY.—Oct. 9.—For erection of a kiln, chimney, engine and boiler-houses at the Barnsley Summer Lane brick-works. Mr. Geo. H. Gray, 6 Royal Street, Barnsley.

BATLEY.—Oct. 14.—For erection of extensions to Hanover Street schools, Batley. Messrs C. H. Marriott, Son & Shaw, architects, Church Street Chambers, Dewsbury.

BATLEY.—Oct. 18.—For supply and erection at the electricity works, Batley, Yorks, of three Lancashire boilers, one economiser, two jet condensers, one electrically-driven feed-pump, injectors, steam, exhaust, feed and condenser pipes and accessories, and a travelling crane. Messrs. Lacey, Clirehugh & Sillar, 2 Queen Anne's Gate, Westminster.

BECKENHAM.—Oct. 14.—For erection of two firemen's cottages, with room to contain a hose-cart, in Station Road, Shortlands, Beckenham. Mr. John A. Angell, surveyor.

BERKHAMPTSTEAD.—Oct. 12.—For additions and alterations to the infirmary and workhouse of the union. Mr. C. H. Rew, architect, Berkhamstead.

BIRMINGHAM.—Oct. 8.—For erection of receiving wards, porter's lodge and new pavilion, stores and offices, workshed, at the workhouse, Selly Oak. Mr. Edwin Docker, clerk to the Guardians, 10 Newhall Street, Birmingham.

BLACKBURN.—Oct. 26.—For providing and fixing two triple-expansion pumping engines, with a six-ton traveller, iron flooring and appurtenant works on the Throstle Street destructor site. Mr. William Stubbs, borough and water engineer, Municipal Offices, Blackburn.

BOURNEMOUTH.—Oct. 15.—For construction of concrete foundations to car-sheds. Mr. F. W. Lacey, borough engineer, Municipal Offices, Bournemouth.

BRIDLINGTON.—Oct. 8.—For erection of central schools and caretaker's residence at Oxford Street, Bridlington. Mr. J. Earnshaw, architect, Bridlington.

BRIDLINGTON.—Oct. 8.—For heating the Central schools with hot-water (low pressure). Mr. J. Earnshaw, architect, Bridlington.

BRISTOL.—Oct. 15.—For erection of new baths in Maze Street, Barton Hill. Mr. W. S. Skinner, architect, Edinburgh Chambers, 16 Baldwin Street.

BUCKFASTLEIGH.—Oct. 15.—For following works in connection with the water-supply scheme, viz.:—(Contract No. 1) covered service reservoir; (2) excavating and laying about six miles of 4-inch and 3-inch cast-iron pipes and other works in connection therewith; (3) supplying about 150 tons of 4-inch and about 80 tons of 3-inch cast-iron pipes, together with all the necessary special pipes required. Mr. T. W. Stainthorpe, engineer, Gate House, Totnes, Devon.

CAMBERWELL.—Oct. 7.—For erection of stables for twenty-three horses, cartshed, stores, &c., at the Glengall Road Wharf. Town Clerk, Town Hall, Camberwell.

CARLISLE.—Oct. 8.—For erection of seven houses in Melbourne Road. Mr. James Beaty, Old Post Office Court.

SPECIAL VENTILATING GEARING FOR CELLS.

Can only be operated from outside, by the regulating movement, and cannot be tampered with inside the cell. Only one Ventilator is shown in illustration, but any number can be worked with the one movement.

FRED VERITY & SON, CALL LANE, LEEDS.

PRICES ON APPLICATION.

[5]

We are also Manufacturers of Fanlight Openers, Skylight Openers, Espagnolette Bolts, Door Checks and Springs, Window Gearing of all kinds, Casements in Wrought-Iron or Gun-Metal, &c., &c.

CAMBRIDGE.—Oct. 24.—For erection of an additional wing on the female side to accommodate about eighty-eight patients and their eight attendants, at the Cambridgeshire, &c., Asylum, Fulbourn, near Cambridge. Mr. A. P. MacAlister, architect, 20 St. Andrews Street, Cambridge.

CANNOCK.—Oct. 17.—For laying mains, erection of pumping station, reservoir and other appurtenant works in connection with the Cheslyn Hay water supply. Mr. R. E. W. Berrington, engineer, Bank Buildings, Wolverhampton.

CARLISLE.—Oct. 15.—For erection of thirteen dwelling-houses in Jackson Street, Greystone Road. Messrs. Johnstone Bros., architects, 39 Lowther Street, Carlisle.

CHEADLE.—Oct. 7.—For erection of mortuary buildings and chapels at the new cemetery, Stockport Road, Cheadle, Cheshire. Mr. Geoff. H. Brady, architect, 18 Little Underbank, Stockport.

CHELTENHAM.—Oct. 30.—For erection of a town hall on the winter garden site. Messrs. Waller & Son, architects, 17 College Green, Gloucester.

COLCHESTER.—Oct. 14.—For supplying and fixing hot-water apparatus for heating the whole of the workhouse and supplying the baths, lavatories, &c., with hot water; also for supplying and fixing baths and sinks as required. Mr. Charles E. White, 57 North Hill, Colchester.

CONISTON.—Oct. 7.—For additions and alterations to the Sun hotel, Coniston. Mr. John Y. M'Intosh, architect, 6 Cornwallis Street, Barrow-in-Furness.

CORNWALL.—Oct. 21.—For erection of an infants' school, additions to girls' school, boundary walls, &c., at Newquay. Mr. James Pearce, clerk to School Board, 1 Lehenver Villas, Newquay.

CROYDON.—Oct. 17.—For erection of school buildings to accommodate about 600 children, with the necessary administrative offices, at Shirley Lodge Farm, Shirley Woodside, near Croydon. Messrs. Newman & Newman, architects, 31 Tooley Street, London Bridge, S.E.

DEVIZES.—Oct. 12.—For erection of new visiting-rooms at the Wilts county pauper lunatic asylum, Wilts. Mr. Charles S. Adye, county surveyor, County Offices, Trowbridge.

EAST DONYLAND.—Oct. 12.—For sinking a borehole in the parish of East Donyland, Essex, to obtain a supply of water. Messrs. Sands & Walker, engineers, Angel Row, Nottingham.

EDINBURGH.—Oct. 7.—For erection of the new Midlothian County Council buildings. Mr. J. Macintyre Henry, architect, 7 South Charlotte Street, Edinburgh.

ERITH.—Oct. 7.—For construction of a galvanised iron building to accommodate twelve patients, as an extension of the infectious diseases hospital. Mr. Charles H. Fry, clerk, District Council Offices, High Street, Erith.

ERITH.—Oct. 8.—For constructing sewers, screen chamber, &c. Engineer's Department, County Hall, Spring Gardens, London, S.W.

FARNINGHAM.—Oct. 12.—For erection of school to accommodate 100 scholars (mixed) and 48 infants at Farningham, Kent. Mr. G. H. Tait, architect, Dartford.

GARFORTH.—Oct. 11.—For provision, laying and jointing of about 1,010 lineal yards of 2-inch cast-iron water-main, including the supply and fixing of valves, &c., at Manor Farm, Garforth, Yorks. Messrs. C. H. Marriott, Son & Shaw, Church Street Chambers, Dewsbury.

HALIFAX.—Oct. 10.—For erection of stabling for twelve horses, cart-shed, &c., at Stone Trough Brewery. Mr. W. H. D. Horsfall, architect, Tower Chambers, Halifax.

HARROGATE.—For erection of stabling at the Ship Inn. Messrs. H. E. & A. Bown, architects, James Street, Harrogate.

ILFORD.—For heating Downhall school, Aldborough Road, Ilford. Mr. C. J. Dawson, architect, 7 Bank Buildings, Ilford.

ILFORD.—Oct. 7.—For erection of a boundary wall and fence, coal store, &c. at the electric-lighting station and depot, Ley Street, Ilford. Mr. H. Shaw, surveyor, 7 Cranbrook Road, Ilford.

IPSWICH.—Oct. 10.—For erection of an arcade, Ipswich, consisting of about forty shops, assembly hall, offices, &c. Messrs. W. Eade & E. T. Johns, architects, Cornhill Chambers, Ipswich.

IRELAND.—Oct. 7.—For erection of two semi-detached villas, Upper Newtownards Road, Belfast. Mr. Thomas Houston, architect, Kingscourt, Wellington Place, Belfast.

IRELAND.—Oct. 7.—For proposed Killea extension of the Londonderry waterworks. Mr. J. J. S. Barnhill, engineer to the Council, 1A Strand, Londonderry.

IRELAND.—Oct. 9.—For erection of a villa in Deramore Drive, Belfast. Messrs. Blackwood & Jury, architects, 41 Donegall Place, Belfast.

NEW CATALOGUES.

MESSRS. J. H. SANKEY & CO., of Essex Wharf, Canning Town, are issuing a new catalogue which will be found a very useful and compendious price list of sanitary fittings and appliances, a class of goods in the manufacture of which the firm have a well-deserved reputation. The various goods are carefully illustrated and described, and all dimensions and particulars of cost fully given. Messrs. Sankey are also makers of plain, fancy and glazed building bricks, vitrified paving bricks, roofing tiles in red, blue and Broseley colours, fire-resisting bricks, of which they make a specialty; finials, chimney-pots, flower-pots, vases and fire bricks, seating blocks, chemical stoneware apparatus, &c.

THE new catalogue, bearing date September, 1901, which has just been issued by the General Iron Foundry Company, Ltd., of Upper Thames Street, is a portly tome of nearly 650 pages, substantially bound and copiously illustrated. The goods manufactured by this firm are so well known that anything like a detailed description of them would be superfluous. We notice, however, many new and very pleasing designs in fireplace interiors, dog-stoves, registers with and without mantels, &c; and some of them, we fancy, are here submitted for the first time. Very artistic effects are shown, too, in wood mantels, while in kitcheners and cooking stoves, lavatories, baths, lamps, railings, grilles and castings there is a wide and extremely varied assortment.

VARIETIES.

ROTHERHAM Congregational church has been reopened after renovation and decoration.

THE Local Government Board have sanctioned the borrowing of 53,000*l.* for the building of new baths in Bradford.

THE Weymouth Corporation are considering the erection of a pier and pavilion, at a cost of about 35,000*l.*

ST. PAUL'S CHURCH, Perth, which has been erected at a cost of 4,000*l.*, and affords accommodation for 800 worshippers was opened on Saturday.

OWING to the increase of business and the want of more accommodation, the Temple Press Cutting Offices are removing from 231-232 Strand, W.C., to 157 Strand, W.C.

THE new drill-hall of the Stranraer Artillery Volunteers, which has been erected in Bellevilla Road, Stranraer, and will accommodate 750 persons, was opened on the 26th ult.

NEW Board schools erected by the Stanley and Outwood U.D. School Board at Lofthouse Gate, Yorks, at a cost of about 7,000*l.*, and capable of accommodating 390 scholars, were formally opened on Saturday afternoon.

MR. MANSERGH, C.E., has presented to the Folkestone Town Council an important report on the improved drainage of the town, which, if adopted, will involve the expenditure of 50,000*l.*

THE new Catholic church at Castlebar, which is one of the finest specimens of ecclesiastical architecture in the Western province, has now been completed, and its dedication will take place on Sunday next. The building was commenced in March 1897, but in the winter of 1898, when the works were well advanced, a severe storm demolished almost half the structure.

IN memory of the late Mr. Hinchliffe Hinchliffe, Cragg Hall, near Mytholmroyd, a new vicarage has been presented to the parish of St. John's-in-the-Wilderness, Cragg, by his daughter, Mrs. Strickland, of Cragg Hall and Southport. The cost of the building, exclusive of ground, also given by Mrs. Strickland, is 2,500*l.* On Saturday the unveiling of a memorial tablet and the dedication of the building took place.

A NEW asylum at Rauceby, near Sleaford, Lincolnshire, which has been under construction for the last two years, is now nearly completed. It has been erected at a cost of 166,000*l.*, and will afford accommodation for 500 patients. The

asylum has been rendered necessary owing to the increase of lunacy in Lincolnshire, and the decision of the Kesteven County Council, for whom it has been built, to have an asylum of their own.

THE business premises occupied by Messrs. Greenhouse & Scrivener, outfitters, at the corner of High Street and Griffin Street, Newport, Mon, suddenly collapsed on Monday through the giving way of a pillar, faced with white bricks, which was the main support of the building. Huge plate-glass windows were smashed to atoms, stock was strewn in all directions, and the principal street was blocked to vehicular traffic. Fortunately no one was on the premises at the time of the accident.

THE new borough boundaries extension scheme at Dover is to be of a very comprehensive character. In addition to the inclusion of St Margaret's Bay, in compliance with the petition of five-sixths of the ratepayers there, Kearsney and River, to which the town has grown out, are to be brought in. It is proposed to extend the municipal electric tramway system to these latter villages. It has been reported to the Corporation that the new cliff drive connecting Dover with St. Margaret's Bay will shortly be commenced.

THE new parish of St. Stephen, Harpurhey, is now provided with a church by the subscriptions of Sir William H. Houldsworth, M P, and Mr. John Railton, through the Bishop's Commission. This is one of a number of parishes recently formed and endowed with 200*l.* per annum from the Manchester Chapter Estates. The Bishop of Manchester has arranged to consecrate this church on Wednesday next. Its cost will be about 5,500*l.*, and accommodation will be provided for 500 persons, all the sittings being free.

THE town clerk of Warrington has received a communication from the Board of Education stating that the Board have under consideration the question of the provision of adequate public elementary school accommodation. They propose to issue a notice calling for the provision of additional accommodation for 250 boys, 250 girls and 300 infants in the Marsh House Lane district, and for 150 infants in Bewsey Road district and for 100 and 150 infants near St. Barnabas's school and St. James's (Latchford) Church respectively.

THE new church halls and rectory which have been provided for St. Mary Magdalene's Episcopal Church, Dundee, were opened on Monday last. The new buildings have been erected on a site in Well Road, a private street in the west end of the city, and have involved an expenditure of 9,000*l.* The principal hall, 72 feet by 50 feet, is capable of seating 1,300 persons, and it is beautifully decorated. Below the large hall is a smaller one to seat 300 persons, and attached to it is a fully-equipped gymnasium. The rectory is in front of the halls, and is four storeys in height. The buildings are lit by electricity.

A CHICAGO inventor, George Magrady, is said to have discovered a process of manufacturing a 36 candle-power light that will never go out. While experimenting with photographic chemicals four years ago Magrady's attention was attracted by a glow in a small globe. Discovery showed the glow was caused by a chemical which the inventor keeps secret. By constant experiments Magrady finally enlarged the glow and perfected the light by placing it in an air-tight glass. He says there is no reason why the light will not remain brilliant until eternity if it is not broken. A company has been formed to manufacture the lights in numerous sizes. A patent hood fits over the globes, and by a simple mechanism covers it completely when the light is not needed.

OFFICIAL intimation has just reached Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, that a large silver portrait medal accorded by Her Majesty, the German Empress, in connection with the Fire Congress of June last, has been presented to the executive of the committee as a mark of appreciation for the services rendered by that body in the demonstration of scientific and economic aspects of fire protection. It will be remembered that a deputation of the committee, comprising Mr. Edwin O. Sachs (chairman), Mr. Ellis Marsland, Mr. F. R. Farrow and Mr. C. E. Goad, accompanied by the secretary and engineer, visited Berlin in the summer,

THE CUNDALL

PATENT

OIL ENGINE

COPY OF LETTER.

THE GREAT WESTERN HOTEL,

OBAN: October 29, 1900.

DEAR SIR,—I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the best favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that my man can start it without any assistance. Most Oil Engines I have seen are difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,

ALEX. MCGREGOR.

R. CUNDALL & SONS, LTD. SHIPLEY, YORKS.

Paris Office—5 Rue Gozlin.

and that an important exhibit of technical models and photographs was loaned to the German authorities for the exhibition held in connection with the Congress.

THE new parish church at Hove, Brighton, which has cost 40,000*l.*, was opened on Saturday. The church was built from designs by the late Mr. Pearson, of Sussex sandstone, and with stone from the quarries of Sir Weetman Pearson, M.P. The seating accommodation is for about 1,300, the building being 160 feet long and nearly 80 feet broad. The nave, including the transept, is 108 feet long and 35 feet wide and is divided into six bays. The two western bays, opening respectively into the baptistery and the base of the tower, are marked by lofty and richly-moulded arches springing from clustered piers attached to the north and south walls. The next four bays open into the north and south aisles and are each 16 feet wide. The arcades consist of clustered piers, 17 feet high, from which spring lofty Pointed arches which support the clerestory.

AN important extension of the Royal Albert Asylum at Lancaster was formally inaugurated at the annual meeting of the subscribers to funds of the institution, which took place on the 26th ult. The Ashton wing, as the added portion is called, is built at the south-east angle of the Brooke wing, is about 150 feet long and two storeys high, and will afford accommodation for the proper treatment and care of fifty cripples and fifty epileptics. Each floor consists of a large dayroom 54 feet by 32 feet; two dormitories, one 60 feet long and the other 41 feet by 47 feet. Besides these there are attendants' rooms and all the necessary offices. Towards the cost of the erection Lord Ashton has contributed 15,000*l.*, which, with donations from other friends, brought the total contributed for this object up to 20,117*l.* 11*s.* 7*d.* The latest extension gives to the institution accommodation for 740 patients. The architects of the building are Messrs. Austin & Paley, of Lancaster.

THE new chapel for Rushden Old Baptist church was opened on the 23rd ult. It is a handsome building, erected upon an excellent corner site in Park Road. The site is large enough for the erection in future years of schools and manse. The style of the building is late Gothic. The organ chamber beyond the choir is very large, 15½ feet by 13½ feet, rendered necessary by the organ. This organ, which was formerly in the old chapel, is the work of a Rushden man, who invented a special pneumatic system in organ building, and patented it in America, where it is now the vogue in new places of worship. The Rushden organ is the only one of its kind in England; it

was erected by Mr. Austin, the inventor, free of cost, the church finding all the materials, which came to about 400*l.* The building has been designed by Mr. H. H. Dyer, of Northampton. Mr. C. E. Bayes, of Rushden, is the builder. The total cost, including site, is about 6,500*l.*, of which about 4,000*l.*, including promises, had been raised prior to the opening.

THE formal opening took place on the 24th ult. of the Friary Congregational church, West Bridgford, Notts. This church occupies an advantageous position at the junction of Musters Road and Millicent Road, and at the corner rises a tower to a height of 56 feet. The body of the building is of an ecclesiastical design, with a nave and side aisles. In addition there is a large church parlour and infants' room at the other end of the building, and there are in all five entrances to the church. The side aisles are used as passages, so that every seat commands a perfectly uninterrupted view of the pulpit. On the north side of the choir is the organ-chamber, and on the south the vestry. A large meeting-room is provided behind the choir, and this will also be used as a choir vestry. The floor is of wood, and the entrances and lobbies are tiled. The roof is on the open hammer-beam principle, and is covered with green slates. The arcade piers are of stone, the lower portions having wood dado dressings. All the woodwork is stained green. At either end of the church is a large handsome window. Seating accommodation is provided for 450 persons. The total cost of the work, which has been carried out by Messrs. Garton & Burton, in accordance with plans prepared by Messrs. R. C. & E. R. Sutton, is about 5,500*l.*

BUILDING AND BUILDERS.

THE memorial-stones of a new Wesleyan Methodist chapel, which it is proposed to erect in Seaforth at a cost of 1,600*l.*, were laid on Saturday.

THE foundation-stone laying of St. Stephen's new church, Smethwick, took place on Saturday. The new church will be in the centre of a large working-class population, and it is intended to create a new parish out of Holy Trinity, Smethwick. The cost, including site, is 5,000*l.*

MESSRS. CUTTS, of Southampton Street, W.C., have prepared plans for a new church to be known as St. Mary's and All Saints, which is about to be erected at Walsall, and a contract has been entered into with Mr. W. Hopkins, of Birmingham.

The wonderful durability of IRISH LIMESTONE is well-known.

ham, for the erection of the building for 4,400%. It is estimated that at least 5,000% will be required to complete the scheme.

A LOCAL GOVERNMENT BOARD inquiry has been held at the Town Hall, Bexhill, to consider the borrowing of a sum of money for the erection of a railway bridge to connect the north with the southern portions of the town, which when completed will be a great boon to visitors and residents. There was no opposition, and it is expected that the erection of the bridge will be commenced forthwith.

THE memorial-stones of the new Bethel Methodist New Connexion chapel, Failsworth (Lancs), were laid on Saturday afternoon. The new chapel will be built partly on the site of the old chapel, which was erected in 1797 and extended in 1811, and partly on the old burial-ground between the chapel and Oldham Road. It is designed in the Early Decorated Gothic style. Seating provision is made for 500 persons, as against about 330 in the old chapel.

At a meeting of the Stourbridge Urban Council on Monday—Mr. J. E. Jones in the chair—Mr. Taylor brought up a report from the housing of the working-classes committee. The committee expressed the opinion that there was need for the erection of houses at rentals from 3s. 6d. to 5s., and they asked for the Council's instruction. Considerable discussion ensued as to whether there was a real demand for artisans' dwellings. Mr. Taylor, in replying to a long discussion, said the particulars the committee had received showed there were 230 working men living outside the township who worked for local firms. The motion for the adoption of the report was carried. Mr. Purkis then moved that the housing of the working-classes committee prepare a scheme for workmen's dwellings at an outlay of 5,000%. Mr. Moyle seconded this, and it was carried.

THE memorial-stones of a new Temperance Hall, which is in course of erection at Lincoln, were laid on the 25th ult. The great feature of the building is to be the large hall. The height of this will be about 40 feet, its length 63 feet, and seating accommodation will be provided for 1,000 people. As the rise of the floor is to be 1 in 10, everyone will easily be enabled to obtain an excellent view of the platform or stage, and the architectural features of the room augur well for its acoustic properties. The floor area widens towards the exit doors, and the seating preserves an even width, so that a gradually widening route to the doors will be formed, an arrangement which will doubtless receive considerable appreciation. Above part

of the auditorium is to be a lecture-hall, 40 feet by 25 feet, in direct communication with the refreshment lift (rendering it available for teas, &c.) and reading and recreation rooms, offices in which to carry on the administrative work of the Society, lodge rooms, &c., are all being provided.

RESTORATION work of some importance is now in progress at Oxford, both at Christ Church and at Merton. At the latter the front of the north transept of the chapel is being refaced. At Christ Church two pinnacles are being added to the east end of the cathedral, at present wooden patterns being erected at which, of course, plenty of adverse criticism is directed. The east side of the well-known Tom bell-tower is also being restored. The work at Christ Church is under the advice of Mr. Bodley, and at the cost of two members of the college. It is satisfactory to note this generosity, for of late the pious benefactor has not been much in evidence at the Universities, and his assistance is needed as much now as in former days. Of course there are some who would prefer that ancient buildings should remain untouched, but in regard to many the time must inevitably arrive when work must be done upon them if they are to be preserved for future generations. Nothing is indeed more striking at Oxford to-day than the decayed state of much of the stonework, many of the details of the sculptures and carving being quite obliterated.

SATISFACTORY progress towards completion is now being made in the erection of the new Central Bridewell, Dublin. In the new building several innovations are being introduced which should tend to the greater comfort of the staff and also to the prisoners. A police station is erected capable of accommodating 100 men, each constable in the new barrack being accommodated with a cubicle containing a bed and table. All prisoners will be provided with separate cells, and a distinction much required will be made between new and old offenders, and the accommodation of the cells, which will be well lighted, will be based on the largest average number the police have had in charge in any given twenty-four hours, but should the necessity arise this accommodation can be extended. One of the greatest improvements in the new bridewell is the provision of a pillar in each cell, whereby prisoners brought in saturated with rain may have their garments dried, while warm clothing will be given to them. Electric bells will be supplied to each cell. When the new bridewell is opened, from inside its gates the prisoners will be conveyed by an underground passage to the dock in the court, thus avoiding the unnecessary humiliation to which they are at present subject.

FURNITURE IN THE COUNCIL CHAMBER.

IN the furniture trade quite a separate department has sprung up in the fitting and furnishing of borough and other public offices, for modern views insist now that places of public meeting or reception shall be well and substantially furnished and in keeping with traditional associations. At one time almost anything would do for office furniture, and hundreds of public authorities have met for years in cheerless rooms, devoid of all taste, furnished with the plainest of deal tables and chairs possessing not even the elementary principle of being safe.

However, times have now changed for the better. Municipalities have made their headquarters representative of the best spirit of public life, and there have sprung up in many parts of the country noble permanent buildings with interiors furnished in thorough keeping with the general style of the new establishments. In the offices of public companies and general business houses the same advance may be marked, and the results produced by the added taste displayed make the different rooms and offices attractive without taking away the solid and useful appearance which should mark every public or private place of business.

Messrs. Hewetsons, of Tottenham Court Road, have found that this branch of the trade requires yearly more care and attention. Indeed, it has now become departmental. The firm has laid itself thoroughly out to meet this latter-day class of business, and the result has thoroughly justified their enterprise. Their latest contracts in this direction have been the Walthamstow and Hemel Hempstead council chambers, the interiors of which have been furnished in the best of taste with furniture which combines simplicity, elegance and strength in a high degree. The workmanship of everything is of the best, and the designs of the two suites and their fittings are at once striking and dignified. Other work in the same direction has recently been executed by the firm, including the furnishing, in part or whole, of the Alexandra Hospital, the Walthamstow Sanatorium, St. George's Infirmary, Henley Town Hall, and the East Sussex County Offices at Lewes. In design and execution the furniture is exactly what such a class of work should be, and a glance at it proves the competency of the West End firm to undertake the most ambitious schemes of local authorities or bodies of a semi-public character. The firm not only submits its own designs, but works to the designs

of architects connected with the building, or other responsible authorities who may need estimates for the carrying out of their ideas, and in this connection the undertakings have been completely successful.

ELECTRIC NOTES.

THE newly inaugurated system of electric lighting at Worthing has been most favourably received. The long stretch of esplanade and the main thoroughfares are brilliantly illuminated, and private consumers of the current are so increasingly numerous that an enlargement of the plant will probably be necessary in the very near future.

ACCORDING to an official announcement the King of Italy will shortly visit Milan in order to inaugurate the huge hydro-electrical establishment which has been built on the Tessin river. The object of the enterprise is to distribute electrical energy for various industries and for the illumination of the town. The new installation is the largest in Europe, and has a generating capacity of over 15,000 horse-power.

THE president of the Leeds Association of Engineers (Mr. G. W. Blackburn, M.I.M.E.), in opening the winter session, remarked that the advantage to be derived from electrical transmission lay in the fact that the power could be applied at any speed, just at the time, and for the time only, during which it was required. It could also be transmitted with the greatest convenience to points distant from its source.

ONE or two new features in electric lighting are being introduced into the nearly completed installation for the illumination of the Victoria Embankment. On the recommendation of the County Council's engineers, the long-burning open type of the Gilbert arc lamp will be used. These lamps take 6 feet of carbon, which greatly lessens the cost of labour for recarboning, and the inconvenience of using ladders in crowded thoroughfares is avoided by an arrangement for lowering the lamps to the ground. The lighting of the parapets was started last February, the existing gas standards being converted for the purpose. As these standards were so close together lamps taking about half the usual amount of electrical energy, and giving a proportionately small light were used. Considerable difficulties attach to the use of these small current lamps, and this is the first time they have been successfully used for extensive public lighting.

TRADE NOTES.

THE Alhambra, Morecambe, has been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their Rahnee radiators.

THE directors of Messrs. John Oakey & Sons, Ltd., have declared the seventeenth half-yearly dividend on the Six per Cent. Preference shares, payable on November 1.

THE new tramcar sheds now being built for the Nottingham Corporation Tramways have been supplied with fifteen steel revolving doors by the B. & S. Folding Gate and Lift Company. The firm has also just completed a contract for four of these doors for a new tramcar shed for the Cardiff Corporation Tramways.

in addition to protection for that sum, draws a guaranteed income of 3½ per cent. per annum on the large annual premium payable.

Any notice of the Mutual Life at the present time would be entirely incomplete without special reference to the splendid building in Cornhill which the company has recently provided for the accommodation of the head office staff in London. From an architectural point of view, the British Metropolis owes much to the great insurance offices. Of the numerous handsome buildings erected by these offices there is none more beautiful or impressive than the new headquarters of the Mutual Life at 16, 17 and 18 Cornhill, and anyone passing by will be repaid for the trouble of stepping in to examine this new triumph of the architect's skill. The old premises which occupied this admirable site, of which the company has purchased the freehold, were not entirely demolished under the scheme for the erection of the new building, and have to some extent been dovetailed into it. Considerable difficulties had to be overcome in doing this, but in the result Mr. J. MacVicar Anderson, past president of the Royal Institute of British Architects, has succeeded in producing a singularly handsome structure, the old building—in which, by the way, the company originally opened the branch on the mezzanine floor—having been entombed in a casket of marbles and alabaster.

Our space will not permit of a detailed description of the building, which must be seen to be able to form an adequate conception of the taste and imposing beauty which characterise the tout ensemble. Suffice it to say that the superficial area of the ground floor is no less than 3,500 feet, and in the accommodation for the clerical staff and the large body of agents, for whom provision has been made, nothing has been overlooked conducive to their comfort and efficiency.

When the company first opened the British branch its competitors naturally made as much as possible of the circumstance that all the vast funds of the company were invested in American securities. The answer that money could be invested more profitably in America than in Great Britain was of course complete, to say nothing of the fact that the leading British offices were proving this by investing largely in American securities.

The acquisition of the important freehold in Cornhill not only effectually disposes of the superficial objection referred to, but the splendid building thereon must be a valuable permanent business advertisement as well as a significant token of the magnitude of the British connection.

THE MUTUAL LIFE INSURANCE COMPANY OF NEW YORK.

THE annual report of this gigantic concern is always interesting reading, and the statements setting forth the operations of the company for the past year will be read with no diminution of the world-wide wonder inspired by its remarkable career.

With accumulated assets of some 67,000,000£ sterling, an annual income exceeding 13,000,000£, and a surplus over insurance liabilities of 11,614,000£, the Mutual Life is still as active and progressive as at any previous period of its history. From the inception of the company in 1842, right onward, it has a record of uninterrupted prosperity, without a single break or set back of any kind, and stands to-day unquestionably as the greatest and most powerful life insurance office in the world. Its history in Great Britain is perfectly unique of its kind. Prior to the year 1887 the Mutual Life was unknown in this country save to expert insurance authorities. To-day the British branch has a premium income of nearly 600,000£ a year, and is doing a larger business than any other office in the United Kingdom with one well-known exception.

The scope of the company's British business is equally suggestive of its popularity. While embracing all classes from the Cabinet Minister to the artisan, the Mutual Life has, to a special degree, won the confidence of the wealthy. One hundred of this class are insured for no less than 1,582,897£, an average of 15,828£ for each person. Not included in this category is the holder of an investment-policy for 50,000£, who,

AN ELECTRIC RADIATOR.

WHEN the Electric Radiator was first introduced, we predicted there was a successful future for it, and during the two or three years that have elapsed our prediction has been amply fulfilled, and the advantages derived from its use under various conditions have become widely appreciated.

The radiator, which will be readily recognised by the accompanying illustration, consists of electric-heat lamps contained in a polished copper reflector. The heat is generated by the current from any electric supply main. All that is necessary to fix them ready for use is to connect the flexible wires attached to each radiator to an electric plug which forms part of every installation. For high or low voltage they are equally adapted, heat lamps of the requisite capacity being supplied, and work satisfactorily on alternating or continuous current. The standard size of these

radiators consists of four heat lamps, sufficient to warm the air of a room 12 feet square, with a consumption of one unit per hour, but they can be regulated to one-half by means of the switches attached. For larger rooms or halls two or more radiators can be used, or radiators can be supplied of a design containing six or more lamps, although the first method is preferable, as the heat can be taken to the point where most wanted, a special feature being their portability. But the most important is that they provide pure warm air, no oxygen being consumed by them, nor are any noxious fumes given off. Their appearance is certainly bright and cheerful, and there are no ashes or dirt to be removed after their use. In a report on these radiators, after being in use for some time at the Isolation Hospital, Leyton, these advantages are specially noted. There are various other uses to which these radiators can be adapted, some of those supplied to His Majesty the King being placed in the bathrooms for warming bath-towels, &c. Fuller particulars can be obtained from Mr. J. Melling, Dashwood House, Old Broad Street, E.C.

THE HOUSING PROBLEM.

A CONFERENCE under the auspices of the City Improvements Department of the Corporation of Glasgow as to cheap dwellings was opened on September 24. The Hon. the Lord Provost (Mr. Samuel Chisholm, LL.D.) presided, and there was an attendance, says the *Glasgow Herald*, of about 160 delegates representing other corporations and bodies in the United Kingdom.

The Lord Provost, in opening the proceedings, expressed his extreme gratification that the invitation of the Corporation had been responded to by so many gentlemen from so many parts of the country. The housing they contemplated might be thus defined: it was the minimum of accommodation and convenience which every man and every family had a right to expect; and the poor were those who, by reason of their poverty would, if left to the ordinary law of supply and demand, be forced to accept less than that minimum. He knew that when he had stated the question thus he had seemed at once to raise a prior consideration which they must take to be settled before they began their discussion, namely, the query of the objector to their considering this question at all. Was there not a law of supply and demand quite sufficient to deal with the entire problem? or was there indeed any problem at all? or were they not making the problem by interfering with

that fundamental and universal law? Now he knew there was such a thing as supply and demand, and he knew that they designated it roughly by the term of law, but he was not aware that it came rightly within the category of law absolute and determined, like a mathematical or arithmetical theorem. Within certain limitations he was personally a great believer in what was thus called a law, but he could never acknowledge it as a universal principle that this so-called law could safely be left to settle all business in all circumstances regarding all classes of requirements and between all classes of people. In order that the principle which the phrase was supposed to embody might work equitably, there would require to be, as he admitted there was in the great majority of cases, something approaching equality between the buyer and seller. As he had said, in most cases this state of things existed. If an article exceeded the price they could afford they could do without it, or they might get something to serve in its stead or wait for a change in the market. But none of these considerations applied in the case of housing. The demand was imperious and brooked no delay. As a matter of fact and experience, the unimpeded action of the law of supply and demand had built up all our back lands, had crowded tenants on one stairhead, and, if a sterner law than itself had not interfered, would have perpetuated those narrow lanes and dark closes and sunless, dark rooms which were a scandal to our social condition. Leave landlords alone and that so-called law of enlightened self-interest would lead them to compete with each other as to who could afford the best possible accommodation at the lowest possible price. Experience of many generations had taught all the great cities that that was not so. The cry of the unhoused—and he called those unhoused who lodged in houses already sufficiently full without them, or who were lodged under conditions and with environments that were a violation of every sense of decency and propriety—the cry of the unhoused and of the insufficiently housed was one which, neither as individual citizens nor as a municipality, which neither as humanitarians nor as Christians, could they afford to neglect. In regard to the parties for whom that provision was required, the question arose, whom did they mean by the poor? The poor might be divided into two somewhat rough classes—those who were poor through small wages, inadequate to meet the necessary demands of their circumstances, and those who were poor because they mispent perfectly adequate remuneration. Now the only difficulty in relation to the last class and in relation to the ruling of them out of consideration

altogether was, to his mind, the presence of the children. But even so, he felt compelled to say that while there might be reason for change in the law of the land that would enable those children to be taken from their unworthy parents and the parents compelled from their adequate earnings to pay for their decent accommodation, that might be open to discussion at another time and under another head; but he could not say the duty rested on anyone to provide for the needs of the self-imposed and perfectly avoidable poverty. These, then, were the views he cherished in regard to the terms of the question they were met to discuss. He could only express the hope that the various papers to be submitted to them and the discussion that would follow thereon would be of such a kind as would contribute not only to deepen their interest in the question, but to point out to them more clearly perhaps the best method in which this problem could be solved.

The Acquisition of Land and Capital.

Preceptor Gray, Glasgow, opened the discussion by reading a paper entitled "Suggestions as to the means of acquiring at lowest possible cost the land necessary for erection of cheap dwellings and obtaining the capital required for the purchase of the land and the erection of the buildings." It was universally admitted that the provision of cheap dwellings was not only the most pressing, but the most difficult, problem that our large towns had to face, affecting, as it did, the vital interests of the largest proportion of our population. In Glasgow they had a population of one or two apartments. Out of 156,000 occupied houses in Glasgow, 36,000 were houses of one apartment, and 70,000 are houses of two apartments. The great difficulty in large towns was to obtain land cheap enough, or, indeed, perhaps at all, for the purpose. It was said, "The earth is the Lord's and the fulness thereof," but we had come to experience in this hard work-a-day world that the earth belonged to someone else. In good Queen Anne's time an Act was passed which declared that to every labouring man's cottage there must be allotted at least four acres of land. What a degenerate age we have fallen upon, when we think of the neglected and huddled-up humanity in our cities. His object was to give suggestions for obtaining the land necessary and the capital necessary for the erection of cheap dwellings. His points were:—(1) Voluntary effort; (2) proper utilisation of present land; (3) duties of Corporation; (4) duties of Parliament. (1) This might well be done by voluntary effort in the method originated by Peabody,

Guinness, and in later times by Cadbury, of Birmingham, and other captains of industry, in securing, as they did, land and erecting buildings, and limiting their use to the labouring classes in receipt of limited incomes, and doing this not for profit. There was no way in which millionaires could so well perpetuate their names as by securing building areas, laying them out, either building themselves or leaving it to the municipality to build houses for the class that was the subject of their solicitude, and when erected to be managed by the municipality as trustees for the public. His second point was that municipalities should have power to call upon owners of slum property to clear the land of what he would call diseased property, which is a menace to the health of the population; that before being allowed to let it they should have a certificate of its suitability. It was not sufficient to shut the properties up. The ground should be brought into public use, and if the Corporation resolve to acquire it they should not require to take it over according to rental, but at the value of the land, after consideration of its surroundings, and the erections as old material. His third suggestion was that local authorities, when securing land for parks or other public purposes, as Manchester did the other day, should see that it was secured untrammelled with restrictions against building, so that a fair proportion of the land may be dedicated to the purpose of building houses for the workers. His fourth suggestion was that they should have increased powers over owners of land. We had on the borders of our large towns tracts of land held by hereditary and other landowners, who could wait, and were waiting, until the trade of the city increased the value ten or twenty fold, and they meantime paid assessments on only one-fourth of its agricultural value. This land was held speculatively for a rise. It was high time that the powers recommended by the Housing of the Working Classes Act, 1885, and the recommendations at a local inquiry, 1890, and, indeed, included in one or more Bills recently before Parliament, should be pressed forward, so that ground might be more and more forced into the market. These were not unfair powers. He could take them to places in neighbouring counties where, when the breadwinner of the family died, the widow and the family were compelled to leave the homestead, and betook themselves to the crowded town rather than that the family should become a burden to the county laird. He said, therefore, that the landed gentry must face the responsibility of furnishing to our town councils a resting-place and home for God's poor, and that a determined and increasing

effort should be made to get full Parliamentary powers for this purpose. Parliament had been niggardly in passing legislation. They must have Parliamentary powers for acquiring land here and there as opportunity offered, not necessarily for immediate use, and without the 10 per cent. for compulsory purchase. Political leaders in opposite camps, such as Mr. Chamberlain and Lord Tweedmouth, had expressed their support of this. We should also have cheaper legal transfers. He prayed that at this representative meeting joint, sharp, immediate action would be taken; that they should not allow Parliament to trifle longer with the question. Large powers were required. Landowners had had the shield of Parliament too long.

Councillor Burt, Glasgow, also made a contribution on the same subject. He explained that the Corporation of Glasgow had experimented a good deal in their efforts to solve the problems indicated, but they appeared to be no nearer the solution than when they started. The difficulties were increased by the position taken up on the question of the land. Two problems were involved, and until they realised that along with the housing of the poor they had to take the question of the abolition of poverty, they were not likely to reach any real practical solution. The Commission referred to recommended a tax upon land held idle or unoccupied. Such a tax would attack the monopoly power of the landowner to keep the land out of the market, and would lead to increased competition among those using the land for the erection of dwellings. The anxiety to get tenants would bring down rents. He urged that a strong and united appeal should be made to Parliament for this reform, in favour of which Glasgow and other municipalities had petitioned. He did not think the acquirement of capital for that purpose presented any difficulty. The Corporation of Glasgow had borrowed money at as low a rate as $\frac{1}{2}$ per cent. per annum, and he did not think they could wish to acquire capital on better terms. The one question that stood in the way was the acquisition of land. Now, without going into detail, the one solution of the question went in the direction of imposing a tax upon the value of land whether it was held idle or whether it was used. People said this was an infringement on the rights of property; but this he denied. The value of the land was increased by the community, and they had a right to that which they created. The greater the prosperity of a city the more the value of the land around it increased, and until they could solve this question they would seek in vain for any solution of the difficulty. He hoped, therefore,

that the conference would agree to some practical resolution on this question.

Construction of Houses.

Mr. A. B. M'Donald, city engineer, Glasgow Corporation, read a paper on "The materials usable for and the various feasible modes of construction which could be adopted in the erection of suitable dwellings, either by way of small cottages or flatted houses, at the lowest cost, and whether the different kinds of work required in the erection of any such buildings should be let to a single contractor or several contractors." He said the purpose towards which the paper was directed was not the discussion of the materials of construction best adapted for what were usually described as dwellings for the working classes, but one quite different and apart—one which, so far as he was aware, had never been crucially investigated—one which had been assumed to be incapable of economic solution, and which had recently been spoken of as outside the province of municipal effort. He meant the rehousing of that nethermost unit of the population whose lives were passed under conditions that ignored alike decency and comfort, whose dwelling, devoid of all the accessories of a home, was the normal refuge of zymotic disease, and whose existence was a continual menace to the public health. Could that unit be displaced and rehoused under improved conditions without involving a charge on the community? If the question was regarded dispassionately, scrutinising its terms with the same rigour as was employed in dealing with a problem in applied mathematics, it had always seemed to him that the answer was affirmative. But the investigation must be entirely divested of sentiment. The figures which expressed the present conditions of the problem were easily understood when it was borne in mind that the law required 400 cubic feet of space to be provided for each adult inhabitant, and a glance at the reports supplied to the sanitary inspector showed how this requirement was transgressed. The instances were innumerable, but one or two might suffice for the present purpose. A house of one room in Marlborough Street rented at 1s. 10d. per week with space for three adults, was found to contain six, of whom four were lodgers, the cubic space available for the six persons being 102 feet for each. In Garngad Road a house of one room, certified for three grown persons and a child, had six adult occupants and two children, five being lodgers, the cubic space to each being 217 feet. In South Coburg Street a house of two rooms, rented at 2s. 6d. a week, with space for three adults, was found to contain seven and two children, five of the grown-

up persons being lodgers, the average cubic space in this case being 171 cubic feet. In Garngad Hill a house of one room, rented at 2s. 1½d. per week, large enough to accommodate two adults, had five and five children, three inmates being lodgers. The cubic space in this case falls to 100 feet for each person. There were other and worse cases, but these displayed the circumstances in which our nethermost unit found habitation, and comment was surely superfluous. It needed not to be said that such a type as that could not be housed in the same manner as the occupant of the improved dwellings that had been provided by the Corporation. On the contrary, the first thing that was imperative in considering the case was to realise that our present-day arrangements and methods of construction could not be applied to it at all. By overcrowding, under the stress of poverty or otherwise, the occupants of the houses just referred to had practically reduced the rent-charge to a half and a fourth of what the landlord exacted, so that the last-named tenant's figure worked out at 6d. per week. To provide for him a new house at that rate in which he could live under conditions that satisfied the law was clearly impossible, even if the site of the building were to be obtained for nothing. The only way in which the housing of persons of this class could be approached was to recognise that the habitations to be provided for them must be structures of a special type wherein everything was reduced to the simplest form, and everything that was not absolutely indispensable must be discarded. A weatherproof shelter with ample space, with water supply and sanitary accommodation, but little more; the whole details so rigidly plain that some relaxation of the Building Acts might be required should the erection of the houses be resolved on, but a clean, healthy dwelling in every way preferable to the abodes of squalor and misery in which the nethermost units were huddled together at the present time. The plan submitted showed the arrangements of three different classes of houses of this description, houses of one, two and three apartments; and the general plan showed how they might be arranged in a comprehensive housing scheme. The method adopted was balcony access with a central stair. There were ten apartments on each floor, or thirty in each tenement, as it was not suggested to carry the building higher than three storeys. Every single-room house would possess 1,200 cubic feet of space, without measuring the bed recess. The walls were intended to be built of common brick with a hollow space for better protection from external cold. The partition

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of
TIGHT GLAZING without PUTTY.
NO OUTSIDE PAINTING REQUIRED.
PERFECTLY DUSTPROOF.
Never adopted saves 95 per cent. in maintenance.

Red Roofs can be Glazed with Straight Glass.

SUITABLE FOR ALL KINDS OF ROOFING,
as Weaving Sheds, Engineering Workshops, Railway Stations,
Arcades, Verandahs, Drill Sheds, Public Baths, Electric
Works, and Horticultural Buildings of every description,
&c. &c.

This System allows for full expansion and contraction of glass, and absorbs any vibration by machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

ESTIMATES AND DETAILED
DRAWINGS SUPPLIED
ON APPLICATION.

AMERICAN MAPLE FLOORING

TONGUED, GROOVED, AND BORED FOR SECRET NAILING.
The Best & Cheapest Flooring yet Introduced.

17 STRAND, LONDON, W.C. (FIRST FLOOR).

walls were also of plain brickwork. A tenement of that construction could quite easily be erected for 1,100*l.*, and the houses, let at 1*s.* per room per week, would yield a rental of 78*l.* per annum. The extent of ground required for each tenement would be 680 square yards, including the proportion of street ground in front of each, but not the ornamental space. Writing off the rental 25 per cent., and charging interest on the cost of erection at 3½ per cent., there would remain a surplus sufficient to meet a charge of 10*s.* per yard for the site. Work of that description, if it was not undertaken by the Corporation employes, ought to be let to one contractor, able to deal with the different tradesmen engaged. If the providing of such houses on a comprehensive scale were undertaken, the cost of construction would be reduced sufficiently to meet all charges for laying-out and paving the streets and adjacent spaces. There were localities in Glasgow not far removed from industrial centres where land could be acquired for a lower price than 10*s.* per square yard, and it was submitted that the plan now laid before the Congress exhibited a method of providing, without loss, a cheaper house than had yet been placed within the reach of the poorest class.

Mr. John Harrison, Glasgow, in opening the discussion upon the three papers, said that Mr. McDonald had wiped out all that Baines Gray and Burt had said by informing them that the class whom they were discussing could not be housed in the ordinary way even if they got the land for nothing. The Glasgow Workmen's Dwellings Company had bought land at 2,500*l.*, and erected buildings which cost 17,000*l.* The advance in the cost of building material was the cause of the great cost of building. It was, therefore, quite impossible for ordinary builders to erect houses for the class aimed at as an ordinary commercial speculation. In London the experience had been exactly the same, with this little difference. Miss Octavia Hill did not pull down and build, but took the slum property as she found it and began to improve the desires and the habits of the people, and as they improved she improved the dwellings. He also quoted the experience of the Glasgow Workmen's Dwellings Company. He urged that the evidence both from Glasgow and from London showed that Baines Gray and Burt were entirely astray in imagining that the whole of this question was merely a matter of cheap ground, and that the whole thing was to drive the land into the market so that a panic might ensue, out of which a solution of this huge problem would be found.

Alderman Newton, Newcastle, said that he did not gather from the contributions of Baines Gray and Burt that they looked upon the land question as the sole solution of the problem. Local authorities required to be placed in a position to secure land upon which to erect houses for the very poorest on the easiest terms. The present period of thirty years for repayment of loans was not long enough. When the scheme which they were endeavouring to formulate was submitted to the Council of Newcastle they would have to show that it was upon a business as well as a sanitary basis. In common with all old cities, they had many slums in Newcastle which must be swept away. As a medical man he had had considerable experience of the slums and their occupants, and he recognised that not only moral but physical diseases were the outcome of slum life. Mr. McDonald's paper was a revelation to him, and he hoped the scheme would be realised.

Councillor Walters, Leicester, said that a grievance the Corporation he represented had in working under the Housing Act was that they had to create a sinking fund for the repayment of principal and interest within a certain period of years. He thought instead they should be allowed to treat the land on a rent basis. Then if they were to erect cheap dwellings for people directly which could be let at 1*s.*, 1*s.* 6*d.*, or 2*s.* 6*d.* a week they must abandon the by-laws of the Local Government Board. They could not possibly build houses with walls 14 inches thick when speculators built walls 9 inches thick. Then he would extend the period of repayment of loans. He would suggest therefore, first, that they should be allowed to pay rent for the cost of land; second, that instead of attempting to build according to the regulations of the Local Government Board, they should be allowed to put up inexpensive, plain, unpretentious, substantial structures, and third, that the term of repayment should be extended over fifty or sixty years.

Councillor Martin, Woolwich, said that the course followed in that borough was that before any great clearance scheme was undertaken provision was made outside, where there was room for those who were displaced. They had advocated the building of houses not necessarily for slum-dwellers, but for the class often known as the aristocrats of labour. That class being withdrawn from the congested areas, space was left for those who were displaced by the improvement scheme. Some would object to the municipality having the pick of the tenants. That was the difficulty of those who believed absolutely in the law of supply and demand, but he agreed with the Lord Provost that the law of supply and demand did not operate in such a manner as to satisfy the first requirements of the human family. Then a suggestion made in Woolwich, as in London generally,

was that they should get closing orders against the slum landlords, leaving it to them to rehouse the people under proper conditions. With regard to Councillor Burt's view, they all knew that in all large centres open spaces were held for a rise. Now, he had no objection to the taxation of land values as a means of increasing the revenue of municipalities and of forcing land into the market. But by doing so they would shut up a number of open spaces before the municipality had provided other breathing spaces in crowded areas. He wished further to mention that the London County Council had extended the term of repayment to a period of sixty years.

Mr. Richards, M.P., said that in his constituency were to be found the Peabody Buildings, and in another part, through the generosity of Lord Iveagh, houses for working people had been provided. As a member of Parliament, he could say the two gentlemen who opened the discussion were beating the air, and if they were to wait till they got better houses and better laws before they dealt with this question, he must tell them that so far as the present Parliament was concerned there was no opportunity whatever of that being accepted. But if there could be any further dealing with the owners of slum property he was perfectly certain that Parliament was prepared to meet the municipalities in a practical way. As for taxing ground values, that was beating the air, and it would not solve the question. Parliament had passed last session without the slightest opposition an Act to allow county councils and municipalities to acquire land outside their areas for the purpose of erecting work dwellings. A month ago he came to Glasgow and went through those buildings the members of the conference were invited to visit, and he could unhesitatingly say that in those on Haghill they would see a solution of the question of dealing with the humble poor. He agreed with the Lord Provost that there was a class of people who lived in insanitary areas whom he did not think it was their duty to provide for. The persons who lived in slum dwellings and who spent one-third or one-half of their wages in drink were not the persons the municipality was to provide for in giving them better houses. The class they had to deal with was that of the humble poor—women who were earning only 2*s.* 6*d.* a day, and men, the casual labourer, whose wages did not exceed 18*s.* to 23*s.* a week. These were the people that it was the duty of the municipality to provide for. The duty of the municipalities was to close these slum dwellings and to provide for the displaced population in some way. He said he agreed that the Local Government Board should be approached on this matter with the view of reducing their requirements for the cheapest class of houses, and he was perfectly certain that Mr. Long would meet the municipalities in a fair way; but if they were to keep back this reform till Parliament passed certain Acts, then they were delaying reform. A year ago a candidate for Parliamentary honour pledged himself to deal with that matter, but up to the present time he had not yet seen any Bill.

Preceptor Gray: Is that Mr. Macrae?

Mr. Richards said he was not going to mention names.

Preceptor Gray: He has prepared his Bill, but there is no chance in the present Parliament.

Mr. Richards said he had not yet seen the Bill.

Mr. Murray, Tynemouth, said any Corporation which made a move to do anything in the shape of improving the condition of the poor was met with several difficulties. His idea was that when the Corporation had shown how houses could be provided, that should be put before builders as an example. At present the poor people were not given facilities to keep themselves clean, and the consequence was that a poor man with a wife and four or five children had to pay a rent of from 5*s.* to 7*s.* 6*d.* a week, and how was a man with 30*s.* a week to pay that? As the Glasgow Corporation had put up better dwellings he thought they could ask the landlords and builders to put up a better class of houses.

Councillor Turnbull, Sunderland, said he agreed with Mr. Gray, but he did not agree with Mr. Burt as to the value of the land in towns. In his own town they had been trying several years to get a Bill to take in a place within a mile of the centre of the town, and they had been refused. As the land inside Sunderland, it would cost 1,000*l.* to 1,500*l.* an acre, while a couple of miles outside it could be had for 500*l.*
